
Where quality means economy, the proper test is service.

DISSTON CIRCULAR SAWS
DISSTON BAND SAWS
DISSTON CHISEL-TOOTH EDGERS

Henry Disston & Sons, Inc.

2-20 Fraser Ave., Toronto, Can.

Edward Partington Pulp & Paper Co.

Limited

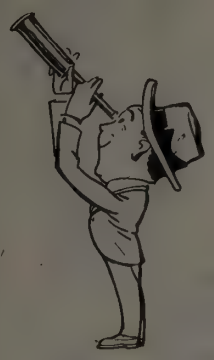
Head Office: ST. JOHN, N.B.

Mills: St. John, N.B. Blackville, N.B. Nanudogan, N.B. Marysville, N.B.

Manufacturers of—

Bleached Sulphite Pulp

Spruce, Pine and Hemlock Lumber, Laths, Hardwoods

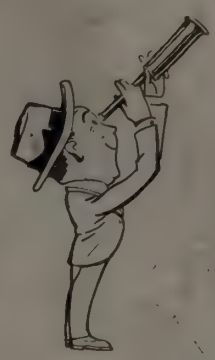


FOR 1916

Look Into the Possibilities

of having a good stock cut perfect from

The Horseshoe Logs
White and Norway Pine



We have the best there is in raw material and our equipment for manufacturing is the latest in saw mill and woodworking machinery. A few of our specialties are: Boxes, Box Shooks, Wooden Pails and Tubs, Pine, Lath and Cedar Posts.

"We aim to serve you with the Best"

Lumbermen's Tents and Clothing

Pure wool, Waterproof Mackinaw Coats, Pants and Shirts,
the kind you have been looking for.

Repellant Brand Army Duck Tents

The best duck that money can buy.
We can equip your van complete.

Pure wool Blankets, Sweaters, Underwear. Hand Knit Mitts and Socks. Palmers Shoe Packs, Buck and horse hide Moccasins, etc.

Grant-Holden-Graham, Limited

Factory and Warehouse

147 to 151 Albert Street, Ottawa, Can.

SIMONDS Circular SAWS

It is always to the advantage of mill owners and operators to use Simonds Solid Tooth and Inserted Tooth Saws, as well as Simonds Band Saws and Planer Knives. The Owner profits more by larger production, better lumber, and fewer delays. The Employee gains by working with safe and sure saws.

Food Supplies for the Camp

Pork Sausage

made fresh daily from choice fresh pork cuttings, tastily seasoned. Contains no beef whatever. Specially packed in 50 lb. tubs with lard covering. If desired, product will be shipped frozen so that it can be carried in the camp (if kept at low temperature) and retain its freshness and goodness indefinitely. Other lines include:

Long Clear Bacon.
Pure Lard.
Barrelled Pork, etc.

IF you are ordering your Provisions for the camp, let us serve you. This is quite an important department of our business and we shall be pleased to quote you special prices on whatever you require.

Write or Wire us today at our Expense for Special Quotations.

Fancy Pickles

Davies Pickles have always been known for their high quality and distinctiveness. We put up all varieties and can ship in any quantity required. Our Tomato Catsup makes a delicious relish and is a most popular line in Canada's lumber camps. Let us quote you, also, on:

"Peerless" Shortening.
Sauerkraut.
Canned Meats, etc.

TERMS OF SUBSCRIPTION

Canada, United States and Great Britain, $2.00 per year in advance; other foreign countries embraced in the General Postal Union, $3.00.
Single copies 15 cents.

"The Canada Lumberman and Woodworker" is published in the interest of, and reaches regularly, persons engaged in the lumber, woodworking and allied industries in every part of Canada. It aims at giving full and timely information on all subjects touching these interests, and invites free discussion by its readers.

Advertisers will receive careful attention and liberal treatment. For manufacturing and supply firms wishing to bring their goods to the attention of owners and operators of saw and planing mills, woodworking factories, pulp mills, etc., "The Canada Lumberman and Woodworker" is undoubtedly the most direct and profitable advertising medium. Special attention is directed to the "Wanted" and "For Sale" advertisements.

Authorized by the Postmaster General for Canada, for transmission as second class matter.

Entered as second class matter July 18th, 1914, at the Postoffice at Buffalo, N. Y., under the Act of Congress of March 3, 1879.

Vol. 36 Toronto, April 1, 1916 No. 7

Immigration to Canada After the War

Our minds are so occupied these days with the events taking place at the front that it is a difficult matter for most of us to give careful thought to other questions, particularly to those which have a more or less abstract nature and require considerable analytical study in order that they may be understood. Some of these questions, however, are today of such importance that they must be taken into consideration earnestly. The most important matter for all of us to consider, aside from the actual prosection of the war, is the question of adjusting our industrial affairs to the conditions which will prevail as soon as the war comes to an end. We touched upon this subject in our last issue in a general way, treating it chiefly from its international point of view in connection with tariffs and treaty arrangements between the Allies in regard to preferential trade, and we called attention to the great revolution which has already taken place in Great Britain regarding free trade, with all that this means to the other parts of the Empire.

In the present issue we publish a letter from a Canadian who has recently returned to Toronto after spending the winter in England where he has had exceptional opportunities for observing conditions as they exist. What he has to say is of much interest and importance and follows out some of the lines of thought which were developed in our former issue. He takes the point of view that the old world will experience greater poverty after the war than has ever before existed and that the debt-stricken countries of Europe will find their people seeking to emigrate to America to share in the wealth the war has left untouched, or has possibly increased. Whatever view one takes upon this question, we believe that there is plenty of sound reason for predicting, in the years which follow the war, a great flood of immigration to America. Therefor, after the question of tariffs and international treaties, the subject which will probably be of greatest importance to Canadians will be that of immigration. Unless the countries of Europe are able to impose upon their inhabitants some cast-iron form of prohibition against emigration, there will be millions of people who will seek their homes in America, and we in Canada will have a great new problem to solve. It is none too soon to give the matter thought today. Our Government ought at once to consider it from every possible point of view.

Already, in the days before the war, we were finding it a difficult thing to keep from our shores many undesirable immigrants who wanted to settle in Canada. After the war, this difficulty will probably be many times greater. These people will be coming to Canada and to the United States. Both countries will want to get the pick of them and to turn aside the undesirables. So we will have headed towards Canada not only those who decide to emigrate to this country, but those also who are rejected by the United States. Our problem will be, not to encourage immigration to our shores, but to separate the good from the bad. We will have a great opportunity to fill up our empty lands with the pick of the English, Scotch and Irish who emigrate and with the desirable ones from the lands of our Allies. At the same time we will have to be on our guard against the rif-raf from all over Europe. We cannot lay our plans any too soon as the job will be a big one when it materializes.

The suggestions made by our correspondent regarding the treatment of immigrants when thy arrive in Canada are deserving of study. Most of the men who arrive on our shores will be experienced in agriculture and in the ways of life in a new country and it will be up to us in Canada to make the most of them; to see that they are taken in charge, provided as quickly and completely as possible with the means of fitting themselves for their new life and encouraged to go on the soil and to help in making our country fruitful.

Trade Ethics Under Discussion in Toronto

"Trade Ethics" was the rather extensive subject discussed at a recent meeting of the Lumbermen's Section of the Toronto Board of Trade. Although the matter was brought up by one member in a rather apologetic manner, it developed a discussion having all the earmarks of something important in the way of definite regulations for the guidance of the trade. The over-lapping of the present fields of operation of manufacturers, wholesalers and retailers was the basis of the discussion. This is a fruitful source of uncertainty and sometimes of ill-feeling among lumbermen, as it is worked out today in most of the Canadian markets. If something can be done to draw the lines fairly clearly between the different fields, it will be a good thing for all concerned. Those who discussed the matter did not seem over sanguine of affecting anything very definite, but the fact that all admitted the importance of making an effort to clear the air of its present uncertainties, indicates that, at least, the question will be pretty well threshed out, and that, if it is possible to draw up workable definitions of the fields of the different members of the trade, it is pretty sure to be done.

The present difficulty commences at either end of the scale and extends right through to the other end. Manufacturers for instance, according to the present go-as-you-please methods may practically consider anyone a legitimate customer. The manufacturer of course confines himself to a very considerable extent to such customers as will take large quantities from him at one time and who are recognized fairly generally as legitimate wholesalers. There are manufacturers, however, who maintain their own selling organizations which are practically wholesale selling firms conducted under the management of the manufacturer. This combination of the manufacturer and the wholesaler in one firm gives it a much wider field of operation than the ordinary manufacturer or the ordinary wholesaler. We do not imply that there is any criticism of this way of doing business, it is a recognized and legitimate manner of marketing lumber. The situation, however, is one which calls for a pretty definite understanding on the part of all concerned as to what lines of trade they ought to consider their legitimate lines. Otherwise misunderstandings and hard-feelings are pretty sure to develop. The discussion of the matter by the Lumbermen's Section of the Toronto Board of Trade was brought up by a member of a firm of this nature who wished to hear the

opinions of others regarding what they consider his legitimate field of operation should be.

When you come to consider the operations of the wholesalers, the field of uncertainty increases many-fold and the troubles increase likewise. There are a good many definitions of a wholesaler and few of them bear much resemblance to the others. It would be a fine thing to have these definitions weeded down to one which would make it possible for the wholesaler to do a good business and yet avoid being called a number of unkind things which we have sometimes heard them called. Then there are firms of wholesalers conducted by parties who are also conducting a retail business. Some of these firms have financial interests in manufacturing operations which are so extensive that they really come very close to being manufacturers as well. They present another source of uncertainty which it would be well to clear up, if this can be done.

There is, in normal times, plenty of business for all these varieties of lumbermen and they can make a good living out of the trade without treading too much on one another's toes. Nowadays, however, when orders ar so rare, it is pardonable perhaps for a wholesaler to think that a retail order is a pretty important bit of business, and perhaps it is pardonable for the manufacturer to think that a contractor who takes a fair amount of stock is a pretty good man to sell to. The small volume of business that has been in progress during the past year and a half has not been enough to make much difference who gets it. But when times are good and lumber is moving extensively it will be a great advantage to the trade in Toronto if something definite in the way of trade ethics has been worked out and put into operation, so that everyone will know where he is at, and if anyone transgresses it will be easy for the others to agree about the extent of his transgression and to treat him in future according to his merits.

A Few Thoughts About Advertising Lumber

Lumbermen in Canada have never taken extensively to the idea which has been worked out successfully in the United States that advertising is not only an individual proposition for the marketing of one's own product but also a proposition which can be handled successfully in a co-operative manner with a view to creating a general demand for an article in the sale of which all are mutually interested. In the United States this idea has been making great advances during the last few years, until today, the producers of various kinds of lumber have, in various instances, co-operated successfuly for advertising their products so as to create a market for the men who have to sell them to the consumer. It is an everyday matter now to pick up a popular magazine and see in it several fine advertisements of white pine, northern hemlock, cypress, southern pine, redwood, etc. These advertisements are profitable or they would not be continued. They are creating in the minds of the public an idea that, after all, there is much to be said for lumber and timber as against their many forms of substitutes. Already the effect is widespread.

Is it not time that Canadian lumbermen took a leaf out of the book of their friends across the line and gave this question serious thought. In the absence of any such co-operation to make the public think about our Canadian products, these United States advertisements are setting up in the minds of Canadians an idea that there are some very choice woods across the line which cannot be had in Canada and which are better even than our own. It would be a comparatively new thing in Canada for the lumbermen to advertise in this manner, but we have good reason for believing that it would be a paying proposition and one which the lumbermen's organizations already in existence in several different provinces could take up to advantage.

Such a plan if worked out rightly would result in benefit to the lumbermen all round. By co-operation of this kind the manufacturer will make lumber a very attractive material for the retailer to handle. The wholesaler will benefit by the better demand coming from the retailer who will find a wider field of enquiry for his goods. At the same time the retailer will naturally become more of an expert in regard to the use of wood and the consumer will get the best material for his purposes in a far greater number of cases than he does today. The retailer moreover, will be encouraged to do his own share of the work by advertising more persistently and more earnestly in his own local papers.

Elsewhere in this issue we publish an article giving a summary of the remarks on advertising made by Mr. R. S. Kellogg, secretary of the National Lumber Manufacturers' Association. The keynote to his address was "Use Wood Where Wood is Best." He brought out the advantages of co-operative advertising, to which we have referred above and also discussed the importance of honesty in advertising. Mr. Kellogg has made a special study of the whole lumber trade in the United States and his opinion carries probably more weight on this subject than that of any other man. He states that the lumber trade, in years gone by, failed to realize the possibilities for increasing its markets which manufacturers in other lines had realized long ago and taken advantage of to the full. As a result of "advertising, lots of it, honest advertising and efficient advertising," he says, "the lumber trade has today revolutionized the methods of merchandizing its product and this applies not only to the manufacturer, but to the wholesaler and to the retailer." Such a strong statement should make Canadian lumbermen give the subject some of the attention which it deserves.

Honesty in advertising is the keynote of the success now being obtained in connection with lumber publicity in the United States. The idea has taken strong hold that the thing to advertise is that wood should be used only where wood is best suited for the purpose and that the public should be educated as to the uses of wood. This education is the field for the combined efforts of the manufacturers and the wholesalers. In working out such a plan in Canada it would probably be necessary to take the production of certain important districts and work up advertising campaigns for them separately. Such a plan is now being put into effect by the Government of B. C. The results, as our readers already know, are definite and most promising. There is probably a good field for similar work in connection with white pine, spruce, hemlock, birch, and possibly one or two other Canadian woods.

It may be imagined by some that our object in urging this proposition is to some extent one of self interest. We do not figure, however, that much of this class of advertising would come to our own columns. The idea is that the public should be educated in the uses of lumber through its popular magazines. Of course, the benefits that would result from the increased use of wood, would also be a benefit to lumber trade publications, but the big benefit would be to the whole industry, and as this plan has been put into operation so successfully in a considerable number of cases across the line, we can see no reason why a similar programme could not be successfully worked out in Canada.

The woodman is not sparing the walnut tree these days. East, West, North and South of Kansas City, there are cars loaded with walnut logs on the sidings and more logs piled along the tracks. The timber is coming to Kansas City to be sawed into gun stocks, says a despatch from that city. Three hundred cars of logs are coming into Kansas City a month, and close to 5,000 gun stocks are being turned out every day. Two plants have the business, the Penrod Walnut and Veneer Company in Sheffield, and the Frank Purcell Company in Armourdale. Each is surrounded by high barbed wire fences, locked gates and warning signs. But the nervousness of war contract holders is easing up.

The appearance of a new lot of shell box contracts in Ontario and Quebec is a welcome event of the last fortnight. About twelve or thirteen million feet of pine, spruce and hardwoods will be required for these boxes and already stock is moving for them. There is just one fly in the ointment although its importance remains still to be seen. The prices of the boxes are said to be so low that there will be very little if any money in them.

New Shell Box Orders Make Their Appearance

On March 17th the Imperial Munitions Board allotted contracts for a little over a million shell boxes. The orders were divided between Quebec and Ontario firms, about 65 per cent. going to Quebec and the balance to Ontario; the Ontario orders being largely located at Eastern points. The contracts are for the production of 6 round 18 pounder boxes; 50 round 4.5 C. C. boxes; 2 round 60 pounder boxes and 2 round 6 in. boxes.

These contracts will require roughly about 12 or 13 million feet of lumber, the varieties being spruce and pine in 1 in. stock 4 in. and up wide for the tops, bottoms and sides, and birch and maple in 1 in. stock varying from 7 in. to 9 in. wide for the ends. The Toronto firms which received contracts were T. H. Hancock and the York Lumber Company.

Bushmen's Battalion Making Quick Progress

A report from Ottawa states that permission has been granted to lumbermen now attached to overseas battalions of the 2nd Divisional Area to be transferred to the 224th Foresters' Battalion of Ottawa.

Recruiting for the Bushmen's Battalion is going ahead rapidly. It is expected that fully 1,500 men will join. By the third week in March 700 men had already enlisted and applications were coming in rapidly from all over the country. On March 18th the 700 men already enlisted were reviewed by his Royal Highness the Duke of Connaught at Ottawa. They presented quite a picturesque appearance, being armed with broad axes instead of rifles. His Royal Highness addressed the officers and men both in French and English, telling them that the service they would render overseas would, in practical value, equal that of any of the best trained, purely military battalions which had gone to the front.

The Battalion will mobilize at Quebec early in April and will be ready for the transports within five weeks from the time the war office asked for it. The officers in command are Lt.-Col. Alex. McDougall, Major Gerald White, M. P., and Major B. R. Hepburn, M. P.

The English Prohibition of Imports

In connection with the prohibition of the import of furniture wood, hardwoods and veneers into Great Britain, which was recently announced, the British Board of Trade has appointed the following committee to grant licenses under special circumstances for importation of such goods:—J. H. Bovill, chairman; Geo. Burt, J. P., and Col. G. T. B. Cobbett, with Mr. H. J. Phillips of the Board of Trade as secretary. The furniture woods, hardwoods and veneers prohibited by the proclamation comprise those hardwoods which are so specified in the appendix to the import list No. 32, 1914. The prohibition of imports does not include fir, pine, spruce, oak, teak sleepers or staves, or wood manufactures, as for instance, 3 or more ply wood. Among the woods for which license to ship must be obtained are the following:—basswood, cedar, gum, hickory, iron wood, maple, walnut and American white wood. All applications for permission to import these woods under special circumstances, namely, where goods were already on the way at the date of the prohibition proclamation, or had been paid for, are to be addressed to Mr. H. J. Phillips, secretary of the Licensing Commission, Gwydyr House, White Hall, S. W.

A cable from London, Eng., under date of March 24th states that the president of the Board of Trade has given notice that after March 30th importation of the following, among other goods, will be prohibited:—furniture, manufactured joinery and other wood manufactures, wood and timber of beech, birch, elm and oak. Importation of these will be allowed only under a license, but such licenses will generally be granted only for goods on the way to the United Kingdom, or goods actually purchased when the notice was issued.

Car Shortage Situation Critical

Orders for lumber for delivery at prairie province points have been so plentiful lately that B. C. mills are confronted with a serious shortage of cars for making delivery. Mr. F. W. Peters, general superintendent of the B. C. Division of the C. P. R. recently issued a statement explaining the company's position, in which he said:—"The lumber mills are pressing the railways for more box cars because of the large orders coming in from the prairies. The difficulty the railways have is that they are called upon by the farmers in the prairie provinces for cars to move the wheat which is still unmarketed, and exposed to the weather. Every car taken away from this service and sent out to B. C. would mean a loss of that car to the best customer the lumber mills have got, and would mean that the farmer would be unable to realize on his crop and purchase lumber. The problem is how to keep the storage elevators open. To receive this grain, cars must be furnished to ship it by rail to Atlantic ports. The storage at these Atlantic ports is all filled up owing to lack of shipping facilities across the Atlantic, which means that thousands of cars are being held under load and thus are out of service. Canadian railways claim conditions on this side of the line are infinitely better than in the United States where the whole country is suffering from a lack of cars to handle the enormous traffic offering."

The congestion in the United States is described in a despatch from Chicago which states that only one of the through railroads between New York and Chicago has its tracks clear. There are 100,000 cars, loaded to the roofs, backed up on the storage tracks between the two cities. Goods that left Chicago in December have not yet got to within 300 miles of the Atlantic seaboard. For a distance of 900 miles every available spur and line is choked with loaded cars. The docks, piers, private warehouses, public storehouses, and open spaces in the yards are piled high with goods. The car shortage situation is expected to become even more acute with the advance of spring, and no improvement is believed to be in sight.

Trying to Relieve Car Shortage

At a recent meeting of the Board of Trade of New Westminster, B. C., Mr. J. G. Robson, chairman of the Lumber Committee, and Mr. Rummell, chairman of the Transportation Committee were appointed a special committee to enquire into the shortage of box cars for lumber exports from that district and to endeavor to induce the provincial Government to assist in facilitating the interchange of cars across the Fraser bridge for the St. Paul and Milwaukee line. Mr. Robson said: "That just at this time when the lumber manufacturing industry had half a chance to come to life, the impossibility of getting box cars, owing to the congestion on the prairies, where cars were used for grain storage purposes, was proving a serious handicap to the mill men. He instanced how local shingle mills were being tied up for want of cars and how the Fraser Mills were short 900 cars. The B. C. Electric were doing much to provide the facilities by making connection with the different railways as the C. P. R. at Abbotsford, Northern Pacific at Sumas, and Great Northern. If some arrangements could be made to facilitate the transfer of Milwaukee cars over the Fraser bridge, this would be a factor in relieving the situation."

Embargoes Hampering New England Trade

Boston, Mass., March 23, (Special to the Canada Lumberman):—Trade is not very active here just now on account of the cold weather and snow we have had. There is still a heavy coating of snow on the ground, in fact as much as there has been at any time this winter. We look for at least a good fair trade when weather conditions improve. Of course in some lines of manufacturing, particularly in box manufacture, there is great activity. It looks as though there would be at least an average amount of building, possibly more. We are greatly hampered by railroad embargoes, and the New Haven railroad seems to be shut off most of the time. It is injuring business on that line and considerably effecting our distribution of lumber. We are in hopes when we get better weather the railroads may be able to take care of their business better, but are afraid the New Haven is not likely to be able to get along without embargoes for a good while to come. Of course New York business is also hampered very much in the same way.

May Tax New Brunswick Timber Lands

The question of how to raise more revenue was discussed by many supporters of the Government in the New Brunswick Legislature recently, and the resolution of J. L. White, proposing to place a tax upon granted lands not included in the school districts was enlarged upon and an amendment offered by L. P. D. Tilley to have a committee of the House inquire into the advisability of taxing both crown and granted lands was adopted. There are 7,000,000 acres of crown lands and it is said about 4,000,000 acres of granted lands. Some propose a tax of two cents an acre upon crown lands, which would yield about $140,000. An equal tax upon granted lands would bring $80,000, but it is said some propose that granted lands shall pay four cents per acre, which would yield a revenue of $160,000, or $300,000 in all. The Speaker appointed Messrs. White, Carter, Mahoney, Jones, Culligan, Woods, Hachey, Tilley, Lockhart and Slipp as the committee for this purpose.

Big Orders for Douglas Fir Gone to U. S.

A despatch from Portland, Ore., states that a contract for 4,500,000 feet of Douglas fir lumber has been awarded by one of the Entente Powers to the Duncan lumber mill. On account of the scarcity of vessels on the Pacific, the entire order, it is said, will be delivered by rail to the Atlantic seaboard for shipment to Europe. The contract calls for delivery within 90 days. Another rush order from an Entente Power, which is said to have been placed with the Wauna mill, calls for the delivery on the Atlantic seaboard of 80,000 feet of spruce for the construction of aeroplanes. During the last few days several large orders have been placed with the Columbia river mills by the railroads. The Great Northern Railroad has contracted with one mill, it is reported, for 4,000,000 feet of Douglas fir, to be used in the construction of box cars.

Canadian Timber Trade in South Africa

Conditions Which Restrict Its Use—How They Can Be Removed—Scandinavian Imports Favored

By H. R. MacMillan*

The natural forests and forest plantations of South Africa supply only a small proportion of the country's necessities. Such timber as is produced in the country is used chiefly for firewood, mining props, railway sleepers, native huts and fencing. Small quantities of the more valuable woods are used for vehicles, cabinetwork and handles. The total amount of South African timber used for all purposes annually is estimated to be 58,000,000 board feet, practically none of which is fit for saw-timber. In contrast with this it is estimated that 120,000,000 feet of sawn lumber are imported into the country annually.

The chief needs of the timber-using population of South Africa are at present supplied by imports.

The timber imports into South Africa for 1914 were valued at $5,962,915. South Africa in proportion to its population ranks after Australia as second in the list of the world's timber importing countries. The average value of the annual timber importations of Australia is $2.87 per capita, whereas the average in South Africa is $1 per head, including the native population who use no imported timber.

Mr. H. R. MacMillan.

The total imports of all kinds in 1914 were as follows:—

Article	1914 Quantity	1914 Value	1911 Value
	Cubic feet.	£	£
Pine	7,437,567	409,597	532,850
Railroad sleepers	Not stated.	377,962	Not stated.
Flooring and ceiling	2,039,736	143,417	187,300
Box shooks	Not stated.	85,228	82,853
Unspecified unmanufactured timbers.	975,539	60,659	51,495
House frames	Not stated.	51,992	70,730
Unspecified manufactured goods	Not stated,	38,902	34,746
Teak	53,207	20,202	(?)
Planed and grooved lumber	173,744	18,937	22,048
Oak	114,360	17,025	12,030
Handles	Not stated.	15,217	15,197
Staves	Not stated.	9,842	13,467
Walnut	42,637	6,337	7,083
Poplar	40,054	5,407	10,485
Hickory	15,956	2,234	8,202
Total	.....	1,242,274	*1,058,486

*Exclusive of an unknown quantity of railroad sleepers and teak.

Considering that no saw-timber is produced in South Africa, with a large agricultural population, an extensive system of railroads and public works and the greatest mining district in the world, the annual importations of timber do not seem sufficient. Timber is sparingly used throughout South Africa. There are three reasons for the grudging use of timber:—

1. The high price.
2. The sale of timber is not pushed.
3. Timber is considered as a temporary material in comparison with substitutes that may be used at the same or less cost.

Timber is inevitably high in price in South Africa. There are five causes for this.

(a) Sources of Supply:—The nearest important sources of supply are Sweden and America. The freight rates from Sweden are normally $10 per thousand feet board measure, and the freight rates from Canada and the United States are normally $15 per thousand.

(b) Profits Demanded by Importers:—In the case of a timber which could otherwise be landed for sale at a low cost the profits demanded by the importers are unduly high. Douglas fir 3-inch by 9-inch deals are landed in normal times at a South African port for 36 cents per cubic foot or 6¾ cents per lineal foot of 3-inch by 9-inch. Swedish deals are landed in normal times to sell at 47 cents per cubic foot or 9 cents per lineal foot of 3-inch by 9-inch. The custom amongst importers has always been to keep the price up by taking a larger profit on the Douglas fir and selling both Douglas fir and Swedish deals at approximately the same price. The purchaser in South Africa thus loses the benefit he would otherwise derive from the presence on the market of a cheap timber such as Douglas fir. Throughout the country it is customary for the importer to secure approximately 4 cents profit on Douglas fir and ½ to 1 cent profit on Swedish deals, per lineal foot of 3-inch by 9-inch.

(c) The Re-sawing of Imported Stock:—The custom in South Africa is to import timber in the shape of deals and logs, which are carried in stock by the importers, chiefly at the coast ports, and to re-saw these stocks to the order of the purchasers. Most of the Douglas fir, whether imported in timbers or 3-inch by 9-inch deals, is re-sawn before being used, except in the case of mining timbers. Large quantities of Swedish 3-inch by 9-inch deals are also re-sawn into 3-inch by 4½-inch, 1½-inch by 9-inch, 1-inch by 9-inch, and 2¼-inch by 3-inch. The sawing is usually done by the importer. The charges levied, though now decreasing, are very high. For cutting a 3-inch by 9-inch deal into 1½-inch by 9-inch or 1-inch by 9-inch, the charge is $1 for each hundred lineal feet of saw cut for Swedish deal and $1.25 for Douglas fir. For cutting a 3-inch by 9-inch deal into 3-inch by 4½-inch or 2¼-inch by 3-inch the charge is 50 cents for each 100 lineal feet saw cut for Swedish deal and 60 cents for Douglas fir. These charges vary slightly, but those quoted fairly represent the cost. In some districts Douglas fir is now cut for the same price as Swedish deals.

These charges for sawing perhaps do not represent an inordinate profit to the importer. Only small lots are sawn at a time, the plant is continually kept changing from one job to another and one size to another. The mills being small cannot be operated on the same basis of cheapness as is the case in lumber producing countries.

The sizes in use in South Africa are fewer than is the case in Canada. A great saving would result if these sizes were imported ready cut and carried in stock. The only objection is the probable loss through the checking or warping of the smaller dimensions when piled in the yards in the very hot, dry and destructive climate of the coast towns. It was observed, however, that a tendency exists to increase the proportion of ready manufactured sizes imported, particularly in Scandinavian goods where several of the sizes smaller than 3-inch by 9-inch may now be purchased 25 per cent. cheaper than the 3-inch by 9-inch, a concession doubtless inspired by the desire of the Scandinavian shipper to utilize the small trees.

(d) Climatic Effects:—The climate of South Africa, coupled with a certain amount of careless handling in the yards, assists to increase the cost of timber. Lumber piled in the open is exposed to months of hot sun and parching wind. Nevertheless, although lumber this year in South Africa is worth on the average over $40 per thousand at the coast, an incredibly large proportion of it was piled in the open, without cover of any kind, without sticking, on poor or no foundations and with little care given to the location or situation of the piles. The losses from checks in re-sawing timbers in some of the railway workshops have run between 30 and 50 per cent. Large proportions of stocks carried by the importers are on hand several months or a year and losses occurring necessarily figure in the selling price of the timber.

(e) Inland Rail Freights:—The inland rail freight rates greatly increase the cost of timber to the great bulk of the population. The timber imported into South Africa is landed at six ports as follows:—

	Cubic Tons 1914
Table Bay (Cape Town)	92,169
Durban	70,334
Port Elizabeth	44,519
East London	42,102
Mossel Bay	5,661
Delagoa Bay	*Not stated

*The importations through Delagoa Bay are usually equal to or greater than those through Cape Town.

Small quantities for Rhodesia are imported through Beira.

Over nine-tenths of the population of the country lives inland. The large towns and many of the best agricultural districts are 300 miles and more inland. The freight rates on imported timber are, generally speaking, twice as high as on domestic timber even though

*Special Canadian Timber Trade Commissioner. Reproduced from the Weekly Bulletin of the Department of Trade and Commerce.

there is as yet no domestic saw-timber. The general level of freight rates may be judged from a few instances.

Cape Town to Hutcheson—419 miles—rate on rough lumber, 37 cents per 100 pounds.

East London to Bloemfontein—404 miles—rate on rough lumber, 42 cents per 100 pounds.

Durban to Johannesburg—482 miles—rate on rough lumber, 72 cents per 100 pounds.

The cost of Douglas fir delivered to the yard in Johannesburg is approximately twice the cost c.i.f. at Durban.

The rate on dressed lumber is approximately twice the rate on rough lumber. Freight is charged on rough Douglas fir at the rate of 3 pounds per foot board measure.

It may be readily seen that in South Africa the cost of lumber to the consumer is very high indeed. Even such large purchasers as mines, railroad departments and construction companies pay high prices. In 1913 the South African railways, buying by the cargo, paid at the coast $40 per thousand feet for third and fourth grade Swedish 3-inch by 9-inch deals, and $37.50 for merchantable Oregon logs. The price to the house-builder or farmer in the interior is very much higher. The average individual purchaser in the farming districts of the country before the war paid 14 cents per lineal foot for fourth grade Swedish 3-inch by 9-inch, or $62.20 per thousand feet. Douglas fir deals or timbers at that time cost the farmer or resident of the small town over 200 miles from the coast slightly more. The prices in 1915 have risen to about $80 per thousand for both Swedish and Douglas fir, common grades.

The small quantity of native timber in the country does not exert any tendency to decrease prices. The Government sells standing timber, situated miles from a railroad, in a forest of mixed species where only one or two species can be logged and operating costs are high, for as much as $20 per thousand feet. The average price of all log timber sold by the Government is $6.60 per thousand feet on the stump. The cost of logging and manufacture in South Africa is much higher than it is in Canada.

The Importing and Selling of Timber

The conditions under which the timber business is handled are not likely to promote an increased demand.

The importing is done by merchants who carry stocks, and not by agents or brokers. In the case of White Sea and Vladivostok timbers or Douglas fir, which because of the lack of a regular liner service must be imported in cargo lots, the number of importers is very small, only two or three in each of the five ports serving the country. In the case of Scandinavian or Finland timber, which may be brought forward regularly in lines fortnightly to any important South African port in quantities of 10,000 board feet or more, a larger number of firms are engaged in importing, and small quantities are imported direct by the builders.

Over 80 per cent. of the timber stocks in the country are carried at the coast in order to avoid investing further capital in the payment of rail freight before the timber is needed. The only timber yards in the interior are at the mines, the railway workshops and comparatively small stocks carried by dealers in Johannesburg and several of the larger towns for the supplying of immediate wants. In towns of less than 5,000 population there are no lumber yards and no stocks of lumber. Anyone desirous of purchasing lumber does so from a price list or catalogue through the general merchant, who sends the order forward to the wholesaler at the coast. Great delay therefore sometimes results in getting timber. A public works engineer in an interior town was three months securing a Douglas fir stick 12 inches by 12 inches by 26 feet.

When inquiries are made by probable purchasers the timber merchants endeavor to get the business. But no efforts are made to encourage the use of timber. This absence of selling initiative and energy causes timber to lose ground with both large and small purchasers.

The railroads, mines, public works and harbor departments are constantly besieged by trained representatives of steel and concrete industries, demonstrating the advantages of using such products instead of timber. After the sales are made and steel and concrete are in use these same representatives are continually on the ground to observe the service rendered by their products, head off complaints, study faults and suggest improvements to the manufacturer in order that the quality of the product may be continually improved.

The small purchaser is similarly affected. Both the wholesaler and the retailer through whom the lumber is distributed to the builder and the farmer in the cities, towns and countries, carry timber as more or less of a side line. They are also agents for and carry stocks of corrugated iron, cement and other substitutes; in fact the retailer in all towns always carries these materials in stock, whereas he rarely carries lumber in stock. The situation, therefore, is that in a large proportion of cases if the builder in a South African town wants lumber he can get it only after effort and delay, whereas cement, metal and other substitutes are ready at hand.

The chief substitutes for lumber in South Africa are galvanized iron, bricks, cement and stone. Galvanized iron was sold in normal times for $40 per ton at the coast, or $47.60 per thousand feet superficial measurement. The freight to interior points is less per superficial foot for galvanized iron than for lumber. Galvanized iron lasts fifteen to twenty years and may be put up very rapidly on a light wooden framework. It has almost displaced inch boards in South Africa; it is used universally for roofing, excepting on a few public buildings and very costly residences. Galvanized iron siding is the most common material for native quarters in the towns and cities, warehouses, factories, mine buildings, preliminary farm buildings; it is also used for tight fencing.

Bricks.—Every town in the country has its brickyard, and every farmer makes his own bricks. Sun-dried bricks are used for native huts in the country, for farm buildings and for partitions in town and city dwellings. Kiln-burned bricks are the most common material for city buildings. Bricks are made and laid by native labor, and in the dry climate even sun-dried bricks last several decades, both for interior and exterior walls; where used in exterior walls they are plastered.

Cement and Stone.—Cement is manufactured in South Africa and retails in the interior and coast cities at $1.25 to $1.75 per bag. The country abounds in easily-worked building stone. Public works, the better class of dwellings and many farm buildings are stone or cement.

It is inevitable that where timber prices are high and substitutes cheap and durable, timber will be sparingly used. At present, timber is used only for false-work, or as a framing or trimming for other construction materials. There is no doubt, however, but that under proper direction the use of Canadian timber in South Africa may be greatly increased.

Sources of Imported Timber

The chief countries upon which South Africa depends for her timber supply are shown herewith, with approximate values of imports from each for 1914:—

Name of Country	Value of Imports 1914
Australia	$376,686
Sweden	372,596
Norway	114,164
United Kingdom	112,656
United States	105,663
Canada	63,377
Russia	43,740

Australia owes her pre-eminence in the list to Jarrah construction timbers and railway sleepers. The chief commodities from Sweden and Norway are 3-inch by 9-inch deals, flooring, ceiling and box shooks. The supplies from the United Kingdom consist principally of sleepers, sash and doors, handles and box shooks transhipped to South Africa from other countries. The United States supplies pitch-pine, Douglas fir, oak, sash and doors, handles and dressed lumber. The importations from Canada are practically confined to Douglas fir, Eastern Canadian deals and dressed lumber. Russia supplies White Sea deals.

From the standpoint of quantity and imports the most important part of the timber trade of South Africa is that listed under the headings "Pine" and "Unspecified unmanufactured goods." This class is also most important to Canada as it includes general building and construction timbers, the classes in which Canadian shippers can compete to the best advantage. The approximate origin of importations of this nature is shown below:—

Country of Origin	Value of Imports 1914
Sweden	$191,258
Norway	62,488
Canada	54,118
Russia	37,437
United States	17,766
Austria	6,760
Total from all countries	$470,256

The small quantities of building timbers secured from other countries are of little importance.

The quantity of rough lumber imported during the past five years has remained fairly constant, averaging in value $500,000 per year. The Canadian share of the trade has, however, diminished, dropping from $74,000 in value in 1910 to $32,000 in value in 1913; the decrease is probably due to a decrease in imports of Eastern Canadian deals, the supply of which in each year is taken up to a greater extent by

the United Kingdom and the United States. The share of the United States in this trade also shows a tendency to diminish.

Two General Classes Imported

The timber imported may be divided into two general classes:—

1. Lumber used in buildings.
2. Timbers used in public works, bridges, harbors and mines.

Building Timber.—The universal building lumber of South Africa for years has been Scandinavian or Russian deals. The chief size imported is 3-inch by 9-inch, the most popular lengths are 11 feet, 12 feet, 13 feet, 14 feet, a small proportion of lengths from 15 feet to 18 feet, and as many 19 feet to 24 feet lengths or longer as can be secured; odd lengths are desired. A small proportion of the import consists of 4½-inch by 3-inch, 3-inch by 2-inch, 1½-inch by 4½-inch. Though these sizes are landed $5 to $7.50 less per thousand feet than the 3-inch by 9-inch, the merchant prefers to import the 3-inch by 9-inch and re-saw it as required. Small quantities are also imported of 3-inch by 11-inch, 4-inch by 9-inch, 2-inch by 9-inch, 1½-inch by 9-inch and smaller fractions sawn from 3-inch by 9-inch.

The grades imported are thirds, fourths and fifths and correspond in qualities and uses to the "unsorted" from Eastern Canada and the "merchantable" and "common" of Western Canada.

The chief uses for Scandinavian and Russian deals are joists, rafters and plates in roofing (studding and planking), and for the local manufacturers of interior finish. The common sizes for joists are 3-inch by 9-inch and 1½-inch by 9-inch. Rafters, studding and roof plates (to support plaster walls and galvanized roofs) are usually 1½-inch by 4½-inch, 2-inch by 3-inch and 3-inch by 4½-inch.

Advantages of Scandinavian Article

The position now held in South Africa by Scandinavian and Russian deals is one which should to a very large extent be held by Canadian timber. The present advantages of the Scandinavian article are:

1. The ease with which it may be purchased.

As pointed out above, a direct fortnightly liner service exists between Scandinavian mills and South African ports. Any merchant or builder could, before the war, write or cable for 20,000 feet or more of any specification and delivery would be made within six weeks of the receipt of the order. The trade had been established for many years and all important builders or timber merchants in South Africa are in touch with Scandinavian shippers from whom they can secure regular monthly shipments of timber without being put to the expense of carrying a large stock.

The case with either Eastern Canadian deals or Douglas fir has been different; it is impossible to buy Douglas fir except by the full cargo, which restricts importation to those ready to invest large sums of money several months before the delivery of the timber. The same has been true concerning the purchase of Eastern Canadian deals though conditions are improving since it has been possible to import parcels by regular monthly sailings. If Eastern Canadian shippers have a surplus for export and can secure transportation when freight conditions become normal they will readily improve their trade by getting in touch through the Trade Commissioner at Cape Town with reliable firms of importers. The sentiment of the trade is in favor of using Canadian timber.

The inevitable result, when the small builder or merchant can buy Scandinavian timber direct, but must go to the large companies for Canadian timber, is that he imports the Scandinavian for himself and only uses or buys the other when he must.

A regular service from Western Canada to South African ports would bring Douglas fir within reach of the small importer in South Africa.

Smaller Margin of Profit

2. Scandinavian timber is handled on a smaller margin of profit.

The one advantage possessed by Douglas fir as compared with Scandinacian timber is its cheapness. The average cost landed at African port of the mixed third and fourth grade Swedish used, was, in normal times, $39.15 per thousand feet. The average cost of the Douglas fir was $30 per thousand feet. A large number of builders and merchants are importing Scandinavian timber in every port, but the trade in Douglas fir is restricted to the few who can finance it. The importers of Douglas fir usually charge about four times as high a profit per lineal foot on Douglas fir as is charged on Swedish timber. In normal times, the profit charged on Swedish was $4.50 per thousand, and on Douglas fir $18 to $19 per thousand, exclusive of any charge for re-sawing. The result of this system has been to keep Douglas fir prices higher than those of Swedish. Were the same profit charged on each, Swedish would sell at about $43.75, and Douglas fir at about $34.50. The quantity of Douglas fir used would immediately be doubled or trebled.

Government Purchases

3. Canadian timber was not accepted by the railroads and Government departments.

The railroads, all of which are Government-owned, and the Public Works Department, are the largest purchasers in South Africa of building lumber. All purchases are made by tender and few merchants can hope to do a large business unless they are able to secure a share of the railroad and government business. The largest purchases made by the railroads are for joists, studding and rafters in buildings, for sides and roofs of freight cars and for planking and decking on platforms and bridges. For years Scandinavian timber has been exclusively specified for the railroad requirements, and offerings of Eastern Canadian deals, even at lower prices, have been refused. The effect on Canadian trade has been serious and has been felt in two directions. Merchants not being able to sell Canadian deals to their largest customers have not stocked them. Carpenters and builders who have had railroad experience carry the prejudice against Canadian deals into private employment, and as a result the timber has been discredited throughout the country. Fortunately, Mr. Egan, Trade Commissioner, Cape Town, was successful in having Canadian red deals used experimentally in the railroad shops for coach building a few months ago. They were found satisfactory and assurance was given by the officials that henceforth Canadian deals would be accepted in competition with Swedish deals.

Fairly large quanitiies of timber have been used by the railroads for car flooring, sills and running boards. Pitch-pine alone has been used for these purposes. The officials in the car shops have believed that Douglas fir was unsuitable and have refused to accept it. Such has been their faith in their opinions that in October, 1915, when pitch-pine could not be secured for a certain car shop, they refused new sound Douglas fir offered them at $60 per thousand feet and paid $100 per thousand feet for second-hand pitch-pine from old buildings, which could only be re-sawn and used at considerable loss. This question was taken up with the general manager and engineering staff of the railroad and arrangements made that selected Douglas fir should be given a trial for freight car building purposes, for use in situations where pitch-pine, Swedish deals and teak are now used. Should such a trial prove satisfactory, as there is no reason to doubt, the effect on the reputation of the timber in South Africa will be great.

Arrangements were also made with the railroad officials that hereafter they will accept Douglas fir for joists, studding, etc., in buildings in competition with Scandinavian deals. This also will have a valuable effect upon the general standing of the timber.

One car shop uses 600,000 board feet of pitch-pine, 600,000 board feet of Swedish deals a year, and no Douglas fir. Large quantities of teak, costing $2.50 per cubic foot, are also used. The pitch-pine is used for freight car flooring. Flooring boards 7-foot 6-inch by 7-inch by 2¼-inch edge, grained cost 72 cents to $1.20 each when ready for use in the shops. Swedish deals are used for siding, ends and roofing in freight cars. Siding boards 2-inch by 6-inch, 8-inch by 11-foot, 12-foot, 13-foot, 16-foot and 17-foot cost on the average $1.10 to $1.32 each when ready to use in the shop. Douglas fir of equal grades equal to fully as severe a service can certainly be delivered to the railroad shops at a lower price.

Teak is now used in the framing of passenger coaches for sills, 4-inch by 14-inch by 63-ft., cant rails 3¼-inch by 5½-inch by 63-ft., and bottom sides 3½-inch by 10-inch by 63-ft. As teak cannot be secured in such long lengths they are spliced each once or twice. Admittedly climatic conditions under which South African coaches operate are severe, yet clear or selected Douglas fir well seasoned and manufactured should readily compete both for service and price. Teak uprights and finish are also used on passenger coaches.

Scandinavian Timber Known

4. The strength of Scandinavian timber is known.

A belief exists amongst builders, engineers and architects, though no facts can be brought forward to support it, that Scandinavian 3-inch by 9-inch deals are stronger and more reliable than either Canadian red or white deals or Douglas fir. Consequently, Scandinavian deals are always specified, except where lengths over 24 or 26 feet are required, when Douglas fir is used from necessity. The prospects for Canadian timber in the South African market would be improved if comparative tests were conducted on 3-inch by 9-inch dimensions in the various grades of Swedish (particularly third and fourth grades), Eastern Canadian and Douglas fir deals, and the results supplied to South African engineers, builders and architects.

The effect of prejudice and ignorance of Douglas fir was clearly shown recently in Cape Town. A certain steamship company when fitting up a large number of transports would not use Douglas fir for rifle racks even though it was offered at $7.50 per thousand feet cheaper than Swedish deals; they feared that Douglas fir was not strong enough and Swedish was used.

Swedish Timber Better Manufactured

5. Timber being valuable in South Africa, and even the third and fourth grades being sorted over to supply material to run through machines for the manufacture of mouldings, interior finish, box shooks

or sash and doors, great stress is laid by the importer on all pieces being true to size. This is particularly important with 3-inch by 9-inch, so much of which is re-sawn into smaller sizes. Swedish timber is nearly always exactly true to size. Timber from North America has not been, and some Canadian shipments containing a large number of pieces of 3-inch by 9-inch, one-half inch or more off size, have seriously hurt the reputation of Canadian deals. Very few complaints were heard concerning the character of manufacture of large timbers. Any shipper desirous of competing permanently in the South African market should send only timber true to size; if this is not done the business will be lost. A variation of one-quarter inch on 25 per cent. of the timber in the 3-inch by 9-inch size is the most that should be allowed.

6. This belief is firmly rooted throughout South Africa. Were it not so the use of Douglas fir would be several times as great.

(To be continued)

Large Increase in Stumpage Receipts

New Brunswick Has Largest Total on Record—Cut Approaching Limits of Annual Growth—Details of Output

The annual report of the Crown Lands Department for the Province of New Brunswick for the year ending October 31, 1915, has just been presented. It shows that the income of the Department has been the largest on record, a big increase being reported in the stumpage receipts. "A more favorable year for lumbering," the report says, "could hardly be anticipated, which accounts to some extent for the large quantity of lumber cut. At the opening of the season prices were not encouraging, but towards the middle of December a brisk demand for lumber products developed in British ports, with a consequent rise of prices, which stimulated cutting beyond the normal. The result was that a greater quantity of lumber was got out than could be marketed, owing to the shortage of shipping caused by the war, and consequently large stocks had to be held over. The following is a statement of the quantity cut on Crown Lands on which stumpage has been collected for the last eleven years, namely:

Year	Super ft.
1905	107,705,676
1906	141,449,449
1907	149,510,471
1908	152,318,333
1909	205,761,583
1910	281,716,402
1911	309,883,428
1912	282,893,141
1913	270,221,155
1914	270,234,773
1915	290,120,823

While perhaps it is a matter for congratulation that such a bouyant revenue from this source can be reported, it is undesirable to cut more lumber than the annual growth, which is estimated roughly at 300,000,000 superficial feet. While we have not yet exceeded the limit, the cut during the past few years has approached the maximum estimate. No one will dispute the contention made by the Department for some years that the indiscriminate cutting of the smaller logs is a practice to be avoided in the interests of the forests and the revenues of the Province. It is my firm opinion that many of the forests of the Province would be stimulated and improved if it were possible that nothing should be cut for at least a decade, in order that sections of the Province which have been heavily operated in the past might be renewed by undisturbed growth. In the attempt to reach a definite policy in this regard, the Department is handicapped by a lack of accurate knowledge of the Crown Lands, but it is hoped that the proposed classification of these lands will remove this difficulty, and will open the way for a very much more satisfactory administration than has been possible heretofore because of the lack of definite information that has prevailed.

The regulations were fairly well adhered to as regards size and the removal from the woods of tops up to five inches in diameter.

As trespassing has been frequent, on unlicensed Crown Lands, a rate of five dollars per thousand superficial feet has been imposed for lumber cut in trespass, which rate was carried into effect by an Order-in-Council and repealed the old rate of double stumpage. Persons who previously cut small quantities of lumber under trespass found it more advantageous to pay the double rate than to take out a license. With the five dollar rate the charge is nearly prohibitive.

The outlook for 1915-1916 is not bright for a large stumpage revenue, and at the time of writing this report would almost warrant the prediction that not much more than two-thirds of the lumber will be cut on Crown Lands this winter than was obtained last season.

The collection of stumpage was most satisfactory, notwithstanding the adverse conditions and the dulness of trade, showing that the financial depression that unhappily exists in many of the other Provinces of Canada was less marked here.

The receipts of the Department for the year and those for the year 1914 included the following:—

Receipts	Year 1914	Year 1915
Sale of Timber Licenses	$ 3,551.50	$ 1,759.00
Renewal of Timber Licenses	81,292.00	81,388.00
Stumpage	385,624.64	422,909.26
Bonuses Timber Licenses	162,288.00	1,971.50

Production During the Year

The following table shows the quantities and kinds of lumber cut from Crown Lands and the total stumpage for the year ending October 31, 1915:—

Quantity	Kinds of Lumber	Stumpage
183,790,316 S. Ft.	Spruce and Pine Logs	$299,823.55
71,893,960 "	Fir Logs	86,727.75
23,852,250 "	Cedar Logs	35,778.37
1,480,023 "	Hardwood Logs	1,850.03
7,875,520	Hemlock Logs	11,025.72
1,228,754 "	Poplar Logs	1,228.75
290,120,823 S. Ft.		
255 Cords	Wood (Fire and Pulp)	117.30
57,364 Pieces	Sleepers	2,868.20
1.830 "	Telegraph Poles	343.00
		$439,762.67
	Add Old Accounts $9,176.00	
	Less Allowances, etc... 1,632.39	
		$7,543.61
		$447,306.28
	Deduct unpaid Accounts	24,397.02
	Paid Provincial Treasurer	$422,909.26

Forest fires during the year destroyed timber on 39,052 acres, valued at $107,030, the cost of extinguishing the fires was $1.253. The total number of fires was 26.

Ontario Lands and Forests Report

The report of the Minister of Lands, Forests and Mines for the province of Ontario for the year ending October 31, 1915. has just been presented.

The revenue accrued from woods and forests for the year ending 31st October, 1915, was $1,629,640.60, a decrease of $379,481.83. The falling off is due almost entirely to decrease in number of railway ties taken out, 729,164 being taken out last season as against 5,439,845 the previous season.

The revenue collected during the year from woods and forests amounted to $1,528,104.82, a decrease of $146,783.11.

The revenue from timber dues was $928,351.38, a decrease of $184,129.00 as compared with last year.

The collections on account of bonus amounted to $507,241.43. an increase of $53,074.19 over that of the preceding year.

The collections from ground rentals amounted to $89,952.01 which is $13,958.30 less than amount collected from same source for the year ending October 31st, 1914.

The revenue from transfer fees was $2,560.00 as against $4,330.00 for preceding year.

The area under license last year was 15,711¼ square miles, a reduction in area of 1,621¼ square miles. The area under license varies from year to year for the following reasons: Areas cut over are dropped from the license; license does not issue on account of non-payment of ground rent; failure on the part of licensees to pay timber dues owing.

There was surrendered during the year 602¼ square miles. New licenses were issued for territory covering 312 square miles.

The production during the year included the following:—pine saw logs, 383,918,834 feet B. M., other saw logs 54,668,902 feet B. M.; boom and dimension timber, pine, 20,922,922 feet B. M., other ,413,160 566,861 feet B. M.; cedar 659,480 lineal feet; railroad ties, 729,164 feet B. M.; square timber, pine, 266,949 cubic feet; piling, tamarac pieces; pulpwood 301,061 cords.

National Wholesalers Hold Annual

Association Made Good Progress During a Strenuous Year—W. W. Knight the New President

G. C. Edwards, Retiring President of National Wholesalers

The National Wholesale Lumber Dealers' Association held their 24th annual convention at Philadelphia on March 15th and 16th. The president, Mr. Gordon C. Edwards of Ottawa, in his address stated that much work had been done in co-operation with other lumber organizations to promote the use of lumber by means of advertising and in other ways so as to combat the unfair arguments used against forest products. During the past two years, while Mr. Edwards was president of the Association, it had successfully weathered the great industrial crisis and was still splendidly equipped to look after the interests of its members. He dealt also with the situation in connection with export trade which had decreased greatly on account of high ocean freight rates and the difficulty of getting space in freight ships. This was a problem that the trade ought to consider seriously, because the lumber exported under normal conditions must be absorbed in the home market under such abnormal conditions. In conclusion, Mr. Edwards referred with great pleasure to his connection with the Association as its president, stating that the two years during which he occupied this position had been most agreeable and that he was grateful for the loyal support he had received from the members.

Mr. E. F. Perry, secretary of the Association, presented an interesting report during which he spoke chiefly of the various lines of work carried on by the Association. Its influence had been strongly exerted in connection with credits, fair dealing and correct trade rules. The Association was now stronger than at any previous time in its history. Speaking of advertising the secretary stated that the Association officers were studying the situation with a view to advertising lumber and its uses, but before much could be done along this line, other important matters must be attended to. While competition would always have a tendency to change prices, regular methods such as drawing up standard sizes, terms of sale, freight rates adjusted to value, etc.. would produce greater stability and greater efficiency. In his opinion, before the lumbermen of the country should spend large sums in advertising lumber as against substitutes, they should spend a liberal amount in trying to find standards along the lines suggested. If from $5,000 to $10,000 were properly spent they could give the architects and builders a lumber code that could be understood and that would net a big return to lumber shippers. Many lumbermen were still relying on merchandizing methods that were in vogue years ago, but with all the other business interests of the country advancing along sound, economic and commercial lines the lumber business must wake up or it would be left far behind.

Interesting reports were presented by the Bureau of Information, the Committee on Trade Rules, the Committee on Terms of Sale and Trade Ethics, the Committee on Forestry, the Committee on Fire Insurance, the Committee on Workmen's Compensation and the Committee on Coastwise Insurance.

The Committee on Terms of Sale and Trade Ethics reported that the terms adopted and approved by the Association had been adopted by a majority of the members, and the terms under which they proposed to sell their goods were 1½ per cent. discount within fifteen days from date of invoice, or sixty days net. These terms were fair and reasonable to all parties. Terms of sale in all cases ought to be considered part of the contract and to apply with equal force as the other questions of price, quantity and quality. The committee commended to the members the code of ethics adopted by the Lumber Trades Congress which embraced the most important matters relating to dealings between lumbermen.

Mr. R. S. Kellogg, secretary of the National Lumber Manufacturers' Association delivered an address upon Trade Extension and the Utilization of Lumber. In the course of his remarks he said that prices, production and terms of sale should be standardized. The scheme of trade-marking lumber had made a good beginning. The whole output of the Southern Cypress Manufacturers' Association would soon be trade-marked and each mill would have a serial number that would identify the source of product. This would be followed soon by the trade-marking of red and white shingles, hemlock and other products. He believed that the trade-mark would do more than anything else to ensure the consumer getting uniformity of production. It meant a great step in advance in the merchandizing of lumber. Advertising to the consumer would then create a definite demand for trade-marked lumber. He reported that a fairly adequate sum of money was already in sight for extensive advertising of this nature. The Southern Cypress Manufacturers' Association had arranged an annual expenditure of $100,000; the Southern Pine Association $100,000; The Western Pine Manufacturers $100,000; The Red Cedar people $60,000; North Carolina Pine Manufacturers $25,000; Committee of the National Lumber Manufacturers' Association $60,000, which would doubtless be increased. These totals, however, were too small, compared with the size of the industry and its importance. The cement industry, with one-sixth of the value of the lumber product, had available three-quarters of a million dollars annually for publicity.

The Nominating Committee offered the names of the following for trustees for terms expiring in 1918: Gorden C. Edwards, Ottawa, Ont.; Charles Hill, New York; H. I. George, Buffalo, N. Y.; C. I. Millard, Norfolk, Va.; T. A. Washington, Nashville, Tenn.; C. A. Goodman, Marinette, Wis.; J. W. McClure, Memphis, Tenn. For terms expiring in 1919—F. R. Babcock, Pittsburgh, Pa.; L. L. Barth, Chicago; J. Randall Williams, jr., Philadelphia, Pa.; R. L. Palmer, Boston, Mass.; T. M. Brown, Louisville, Ky.; Horace F. Taylor, Buffalo, N. Y.; W. S. Harland, Lockhart, Ala. The election of these was unanimous.

J. Randall Williams, sr., placed in nomination W. W. Knight, of Indianapolis, Ind., for president. The nomination was heartily seconded by J. V. Stimson, of Huntingburg, Ind. Mr. Knight was declared president and was introduced by retiring President Edwards as his successor amid a roar of applause. The new executive responded in a brief expression of thanks.

A meeting of the board of trustees was held immediately after the adjournment of the general session. This elected M. E. Preisch, of Buffalo, first vice president; B. Franklin Betts second vice president. Henry Cape, treasurer, and E. F. Perry, secretary, were re-elected to their respective positions. The trustees confirmed the choice of the convention in electing W. W. Knight president. W. W. Schupner was ordered continued as the head of the bureau of information.

Imports Into Australia for Twelve Months

Mr. H. O'Neill, 605 Culwulla Chambers, Castlereagh Street, Sydney, N.S.W., furnishes the following report showing the total quantity of timber imported from America, Japan, Norway, Sweden into Australia from July 1st, 1914, to June 30th, 1915.

Oregon	63,236,978
Oregon door stock	126,345
Oregon lath	1,266,380
Oregon pickets	1,254,478
Redwood	12,240,897
Redwood door stock	1,393,444
Redwood shingles	70,600
Baltic	10,651,392
Oak	5,027,689
Ash	603,146
Pine	1,205,490
Kauri	1,205,490
Sen	213,732
Yellow pine	430,307
Yellow pine door stock	40,765
Total	97,994,201

May Soon Re-open Panama Canal

Announcement by Col. Harding, acting governor of the Panama Canal zone, that conditions in the Gaillard cut justify predictions that the canal will be available for passage of large ships April 15, would be expected to have an immediate effect on the lumber market under conditions other than those which now prevail regarding ocean shipping. With Eastern terminals practically closed for the time being to rail shipments from the south and west the re-opening of the canal would mean a heavy movement of lumber from the Pacific Coast to eastern markets, but if western mills have not better facilities at their hands than are now available at Atlantic and Gulf ports, there seems very small chance of Pacific Coast mills flooding eastern markets. Even such shipments as southern mills have found ships to carry have been delayed on arriving at North Atlantic ports because of the congestion on the docks and the inability of the carriers to switch or move inland such cargoes as were unloaded. Weather conditions which have prevailed on the West coast for the past two months are also reported to have greatly curtailed production there. So it hardly seems probable that the opening of the canal at this time will mean

that Pacific Coast woods will be enabled to beat the southern products to the eastern markets.

Predicting when the canal could be used heretofore was rewarded with about as much verification as the proverbial weather reports, but since the last great slides and the complete closing of the canal to traffic, the Government engineers have constantly refrained from predictions of a definite date for re-opening. Col. Harding, who, it is understood, is to succeed Major-General Goethals as Governor of the canal zone, this time qualifies his prediction with the statement that there will probably be temporary delays after April 15, to meet exigencies of the dredging fleet in completing the canal to full depth, and in removing shoals that may develop. It will be recalled that General Goethals has wished to resign for some time to become a retired army officer, but the slides have conspired to keep him on the job. If Col. Harding's prediction comes true it is said at Washington that it will not only mean the resumption of traffic through the canal, but promotion for Harding and rest for General Goethals as well.—Southern Lumberman.

No More Ungraded Resawed Two Inch Hemlock

For some time past the practice of resawing two-inch hemlock piece stuff and shipping the product of the original piece, mill-worked to boards of various patterns, has long been considered unbusiness-like by the hemlock manufacturers of Wisconsin and Upper Michigan. A large portion of the retail trade have also taken the same view. The question has been under discussion at several of the meetings of the Northern Hemlock & Hardwood Manufacturers' Association, with the result that by a practically unanimous vote, the practice of selling two-inch resawed hemlock and shipping the product of the piece ungraded, has been made a thing of the past.

The resolution as adopted was as follows:

"We, your committee appointed to draft a resolution embodying our views regarding the practice of marketing the product of 2-inch hemlock, piece stuff resawed, firmly believe that our best interests can only be conserved by forever eliminating from our product the resawed piece stuff grade, and further believe that it would be the height of folly to spend our money advertising this product. We also believe that our friends, the retailers and consumers, will agree with us when they understand that we are going to give them grades that have standing in our organization, that will place our product on a higher plane, that can be reinspected by our inspectors, that every piece can be used in the grade in which it belongs and for the purpose intended, and will give the trade much greater satisfaction than our former practice.

"Therefore, we recommend to the board of directors they confirm the above."

The board of directors also instructed the sales managers' committee and the bureau of grades to do all in their power to make this resolution effective. That is, ungraded resawed hemlock no longer has any official standing, and practically all of those manufacturers have agreed not to sell such stock ungraded in the vicinity west of Lake Michigan. This does not mean that anyone should not resaw or obtain boards, if they so desire, but if this is done, the stock should be graded to a strictly board grade and the boards should be made of a standard that will invite criticism by the purchaser and will further stand an official inspection. The proposition has also been taken up with nonmembers of the association, and indications are that they will be pleased to join with the movement.

A large number of the Northern mills have already notified their trade of their action in regard to the resawed proposition.

The Situation in British Columbia

Mr. Rogers, president of the Vancouver Board of Trade, in his annual address, made the following reference to the lumber industry of the province:—"The chief contributor to the wealth of British Columbia is the lumber industry. During the past year not more than half our mills were in operation. The price of logs as well as lumber dropped to the lowest point obtained for years. The output diminished from that of over a billion feet in 1914, to less than eight hundred million feet in 1915. There has been a recent increase in prices for both logs and lumber, and now many large logging companies are beginning operations and mills are beginning to cut, which have laid idle for months. This condition of the industry was not occasioned through lack of demand, as much as through the great lack of bottoms to carry the commodity to the markets of the world. There seems to be a likelihood of the immediate building of ships in this province which will, no doubt, tend to relieve this situation. So our lumbermen look with a great deal of hope that the year 1916 may yet become a very profitable one. Your council discussed with the premier of Australia on his recent visit to this coast, the matter of establishing a preferential duty between Canada and that country on sawn timber and, although he did not say such an agreement would immediately eventuate, he held out promises of earnest consideration. If a fair preferential duty is obtained with Australia, we consider the lumber situation will be relieved immediately, and our province will have a preferred market of 240,000,000 feet placed at its disposal.

Lake States Lumber Production

The Lake States produced nearly 4,000,000,000 feet of lumber in 1914, which was a gain of 52,000,000 feet over 1913. This is a unique distinction for this lumbering region since both the south and west suffered a loss in output as compared with 1913, Minnesota is responsible for the gain, contributing 163,000,000 feet more than in 1913 and taking second place away from Michigan. In Michigan there was a slight decrease amounting to 1½ per cent. In Wisconsin the decrease amounted to over 100,000,000 feet, or nearly 7 per cent. However, Wisconsin still retains first position among the Lake States in lumber production and produced 1,391,000,000 board feet in 1914. The number of active mills reporting in 1914 was 1,181, as against 1,498 in 1913.

The following table shows the lumber sawed in the three states in 1914, 1913 and 1912:—

Lumber Production in Lake States

	1914		1913		1912	
State	Number active mills reporting	Lumber sawed M. ft. b.m.	Number active mills reporting	Lumber sawed M. ft. b.m.	Number active mills reporting	Lumber sawed M. ft. b.m.
Michigan	428	1,214,435	532	1,222,983	792	1,488,827
Minnesota	286	1,312,230	354	1,149,704	484	1,436,726
Wisconsin	467	1,391,001	612	1,493,353	792	1,498,876
Total	1,181	3,917,666	1,498	3,866,040	2,068	4,424,429

Twenty-two different species contributed to the lumber production in the Lake States in 1914. In Michigan and Wisconsin, hemlock yielded the largest amount of lumber. In Minnesota white pine supplied nearly 90 per cent. of the total for the State. In Michigan the softwoods, which include hemlock, white pine, tamarack, spruce, balsam fir, and cedar, yielded over 576,000,000 feet; in Wisconsin over 864,000,000 feet, and in Minnesota 1,258,634,000 feet, or 95 per cent. of the total production for that State. Cottonwood was the only hardwood that contributed appreciably to the lumber output of Minnesota.

Hemlock in Michigan and Wisconsin suffered a loss of 100,000,000 feet, or ten per cent., as compared with 1913. The total of 1,423,000,000 feet of white pine sawed in the three states is a loss of 95,000,000 feet. White pine declined over 85,000,000 feet in Wisconsin, but made a gain of 81,000,000 feet in Minnesota.

Mills producing annually 10,000,000 feet each reported a total production of 2,864,000,000 feet, or 70 per cent. of the output in the Lake States.

The following table shows the production by kinds of wood of the fifteen leading kinds for the year 1914:—

Quantity of Lumber Sawed, by Kinds of Wood

	Lumber Sawed (M. Feet, B.M.)			
Kinds of Wood	Michigan	Wisconsin	Minnesota	Total
Hemlock	416,131	590,484	300	1,006,915
Maple	370,271	156,363	599	527,233
White pine	91,487	223,433	1,108,021	1,422,941
Birch	84,342	190,468	6,854	281,664
Beech	70,337	4,257	.....	74,594
Basswood	43,568	92,077	9,685	145,330
Elm	41,790	51,640	4,259	97,689
Tamarack	26,787	36,685	53,131	116,603
Spruce	23,417	6,692	68,325	98,434
Balsam fir	10,900	2,017	28,398	41,315
Oak	9,707	15,440	7,793	32,940
Ash	8,893	15,310	2,009	26,212
Cottonwood	8,364	812	22,395	31,571
Cedar	7,724	5,049	459	13,232
Total	1,214,435	1,391,001	1,312,230	3,917,666

Prosperity Ahead for British Columbia

Mr. A. E. Rosevear of Winnipeg, general freight agent of the Grand Trunk Pacific Railway, during a recent visit to British Columbia, stated that after the war many millions of ties and immense quantities of timber would be required for railroad construction and for re-construction purposes in Europe. "Already shipments of lumber to Europe have been very large," he said. "Through the Seattle gateway alone heavy consignments have been shipped to Russia for railroad purposes, and when the war is over the demands will be many times multiplied. There should certainly be a great trade in lumber out of British Columbia to Europe when the war is through with."

Encouraging reports were coming in from the Prairies. Farmers were buying freely and there would soon be a heavy demand for lumber from the northwest.

Increasing Use of Treated Wood Block

A Market for Canadian Woods That Has Been Greatly Neglected—How the Materials Are Produced and Used

By W. G. Mitchell*

During the past decade there has been a steadily increasing interest among municipal highway engineers in the possibilities of creosoted wood block paving for city streets. During the same time there has been, in the United States particularly, a corresponding increase in the use of this type of pavement. This may be attributed to a number of factors. The general recognition of the economic importance of good roads and street surfaces has attracted to this field the attention of competent engineers of specialized training and experience, resulting in the development of marked improvements in practice. This has been accompanied by, or indeed perhaps, has been responsible for a public demand for higher standards in the maintenance of city streets. Again, during this time, there has been a considerable increase in volume, and a marked change in the character of city street traffic. The general use of heavy motor-driven vehicles particularly has imposed exacting service requirements upon street pavements, and these requirements have not been entirely met by some types of pavement which were satisfactory under former traffic conditions. Again, referring more particularly to conditions in the United States, there has been a most striking development in the wood preserving industry, due in part to economic demand, and in part to improvements in methods and practice of the preservative treatment of timber. This development, marked by the establishment of commercial timber treating plants throughout the country, has made it possible to obtain creosoted wood paving blocks at reasonable cost in practically any locality. But, apart from the factors noted above, all of which have contributed in directing favorable attention to wood block paving, the very encouraging service results which have been realized with this type of pavement have been responsible in largest measure for its increased use. The history of creosoted wood block paving has not been free from failures, but it may be noted with satisfaction that these failures have been made the subject of careful observation and experimental study, not only by those associated with commercial interests, but also by independent technical investigators. As a result the causes of many of these early difficulties have been located, whether in methods of treating blocks or in design and construction of pavement, and improvements in practice have been made accordingly.

Increased Use of Wood Block Paving in United States

Referring further to the marked increase in the use of wood block paving in the United States, it may be of interest to quote from statistics compiled and published by the United States Forest Service. In 1909, the total amount of timber treated as paving blocks for use in cities of the United States was 2,994,290 cubic feet, equivalent approximately to 1,150,000 square yards of pavement. In 1914, the timber treated for this purpose was 6,869,370 cubic feet, equal to about 2,617,000 square yards. In 1911 the reported area of creosoted wood block pavement in service in a number of the larger representative cities of that country was as follows:—New York, 650,000 square yards; Chicago, 700,000 square yards; Minneapolis, 950,000 square yards; Indianapolis, 500,000 square yards, and Cincinnati, 375,000 square yards. These figures constitute a substantial and convincing evidence of the fact that the merits of creosoted wood block paving for city streets have been proved beyond question.

Referring to the present use of wood block paving in England, and more particularly in London, as the world's greatest metropolitan district, it is interesting to note that creosoted wood block paving has there reached its most successful development. The significance of this statement can be appreciated fully when the traffic conditions of some of the principal thoroughfares of London are understood. Mr. Henry W. Durham, Chief Engineer of the Bureau of Highways, Borough of Manhattan, New York, commissioned in 1913 to make a personal investigation of paving materials and pavement construction and maintenance in European cities, in a report recently published, notes with reference to the wood block pavements of London—" . . . . a large extent of softwood pavements on its principal thoroughfares. (Borough of Westminster). The last are probably the finest pavements in the world. Particularly good is that on Parliament Street and Whitehall from Parliament Square to Trafalgar Square. It carries a heavy traffic, principally motor omnibuses and other motor vehicles. Having less traffic but a very extensive one of pleasure vehicles of all classes is the Mall, extending from the Admiralty Arch at Charing Cross to Buckingham Palace. This is also wood block on concrete foundation and presented the nearest approach to a perfect street surface observed anywhere." This favorable testimony from an independent and critical observer, is worthy of the careful consideration of Canadian highway engineers and others interested in the problem of city street paving. It is also significant to note in passing that the Baltic or Scotch pine heretofore used almost exclusively for the construction of creosoted softwood block pavements in England is all imported timber. The successful development and extensive use of creosoted wood paving in English cities in spite of the lack of available domestic supply of timber is a striking tribute to its superiority.

* Chief of the Division of Wood Preservation, Forest Products Laboratory of Canada.

History of Wood Block Paving

It may be well to consider briefly the history of the development of wood block paving. Untreated wood block pavements were in use in England at least eighty years ago. In the United States and Canada such pavements, generally built of round blocks, were quite widely used as early as 1850, and some cases of such pavements were to be found as recently as fifteen or twenty years ago. These blocks were laid on plank foundations or in some cases on macadam foundation only. These pavements obviously could not be entirely satisfactory, but they served a useful purpose during a certain development period in the United States and Canada. Later untreated rectangular wood blocks were adopted. This was an improvement in some respects, but early failure of such pavements from decay of blocks was the inevitable result. Later the development and more general use of preservative treatment of wood suggested the application of such treatment to wood paving blocks. According to first methods of treatment adopted for this purpose, blocks were dipped in hot creosote oil. Such treatment resulted in the absorption of from two to four pounds of oil per cubic foot of timber. This marked a distinct improvement in practice, and such dipped wood pavements may be considered the immediate step toward the development of modern creosoted wood block paving. Considerable areas of dipped block pavement were laid in the United States and Canada with satisfactory results. There are such pavements still in service in Canadian cities, many of which are now in good condition. It may be of passing interest to note that there are several dipped wood block bridge floors in the city of Ottawa, laid from six to eight years ago, which have given good service, and are at present in very satisfactory condition. However, the general adoption of pressure methods for impregnating timber with preservatives naturally led to the use of pressure treated paving blocks. Absorptions of creosote up to 20 pounds per cubic foot may be obtained by such methods, and with the heavier impregnation of preservatives the protective value of the treatment is obviously very much increased. The creosote oil injected within the block serves the double purpose of protecting the wood from decay and acting as a waterproof filling material. Pressure treated blocks are now used universally for wood paving, and it should be understood that claims made in this paper for creosoted wood block paving, refer to such methods of treatment.

Methods of Treatment

A brief description of the present commercial methods of treating paving blocks may be of interest. Blocks are cut from 3-in. or 4-in. stock, varying in width from 5 ins. to 10 ins. The stock is planed on one side to insure a straight edge, and is cut on gangs of small circular saws, on which provision is made for adjusting saw spacing, according to the depth of blocks required. In American practice, blocks are cut in 3-in., 3½-in. and 4-in. depths, according to the requirements of traffic conditions for which they are to be used. The sawn blocks from the gang pass to the conveyor, where defective blocks—those under size or showing heavy cracks, loose knots or decay—are removed. Inspected blocks are carried by conveyor to cylinder block cars. These block cars are from 7 ft. to 9 ft. long, of cylindrical shape, 5 ft. to 6 ft. in diameter, mounted on narrow gauge tracks. Cars are made with perforated steel plate sides and closing over to prevent blocks floating out in retort. Commercial pressure treating retorts or cylinders are usually 6½ ft. to 7 ft. in diameter and from 120 ft. to 130 ft. long. They are designed for working pressures up to 250 lbs. per square inch, although operating pressures during treatment of timber seldom exceed 160 lbs. to 175 lbs. per square inch. Retorts are charged with a train of loaded block cars. The capacity of a commercial retort of typical size is from 1800 to 2100 cubic feet of paving blocks, equivalent approximately to from 600 to 700 square yards of 4-in. block pavement.

After blocks are charged into retort they may be subjected to a preliminary steaming at temperatures ranging from 225 to 240 degs. F., for a period of from one to three hours, as may be required. If this feature of treatment is adopted it must be followed by a vacuum

drawn in the retort up to 20 ins. or 24 ins. mercury. Exhausting the retort after steaming is for the purpose of evaporating the water and withdrawing a part of the air contained within the wood. Preliminary steaming and vacuum before the admission of the preservative to the retort, is not always specified in the treatment of paving blocks. However, results of an experimental investigation by Mr. C. H. Teesdale at the United States Forest Products Laboratory, Madison, reported in a paper presented at the eleventh annual convention of the American Wood Preservers' Association, January, 1915, indicate that these features of treatment are desirable for blocks of some species at least. After steaming of blocks and exhaustion of the cylinder, or in some cases, as above noted, without any such preliminary treatment, creosote oil, previously heated to a temperature of from 170 to 200 degrees F. is admitted to the retort, and pressure applied gradually until the desired absorption of preservative has been attained, as indicated by gauges on oil stock tanks. The oil is then withdrawn from the retort, and if desired a subsequent short steaming period may be included in the treatment, for the purpose of cleaning the surface of the blocks. A final vacuum, after the injection of the preservative, for the purpose of withdrawing excess of oil from the wood, is a feature of one proprietary method of treatment which has been extensively used in the United States and Canada with good results.

The preservative used almost universally for paving block treatment is coal tar creosote oil,—either straight distillate product of coal gas or coke oven tar, or more generally in present commercial practice, a mixture of such distilled oil and filtered tar. These mixed "paving oils" are now very extensively used for paving block treatment in America, and it is probable that if they meet the requirements of approved detailed specifications as to methods of production, composition and physical properties, they are as satisfactory for this purpose as the higher priced straight distilled oils. The absorption of oil in paving block treatment, with the exception of Douglas fir blocks, is generally specified to be from 16 to 20 lbs. per cubic foot, in correct American practice. While absorptions of 20 lbs. per cubic foot were formerly generally required, the recent general tendency is toward somewhat lighter impregnations—16 to 18 lbs. per cubic foot. The writer is inclined to believe that absorptions of from 14 to 16 lbs. per cubic foot are sufficient for some Canadian woods for which heavier treatment have heretofore been specified. An absorption of 10 to 14 lbs. per cubic foot is the usual standard for the treatment of Douglas fir blocks.

Construction of Wood Block Pavements

The design and methods of construction of wood block pavements are in general similar to those of brick or other block pavements, although certain features have been developed to meet the special conditions. A concrete base is laid, 5 inches to 6 inches in thickness, conforming in general to the contour of the finished pavement, usually with a crown allowance of 8 inches on a fifty foot street width. On this a three-quarter-inch cushion of a 1.3 cement sand mortar is spread dry and struck off with a template or spacing strips. This cushion is sprinkled in advance of the placing blocks. These are laid with the grain vertical, in straight parallel courses, which may be at right angles or inclined to the street line. A ¾-in. or 1-in. expansion joint is allowed at each curb and a single or double course of header blocks placed parallel to the curb line. After laying, blocks are rolled to surface with a steam roller, and block joints filled with a suitable bituminous filler material. This is generally specified to be an asphalt cement or a mixture of coal tar pitch and asphalt. This material must be carefully squeegeed into joints to a depth of at least two-thirds the depth of blocks. The finished pavement is covered with a light layer of clean sand, which cleans the surface of the excess of filler and oil, and incidentally is partially worn into the blocks by traffic, forming a more resistant wearing surface. A thin cement grout washed over pavement after pouring bituminous filler is frequently used as an additional means of securing a clean surface.

It is unnecessary within the limits of this paper, to offer any more detailed description of methods of treatment of wood paving blocks or design and construction of pavement, all of which are covered in carefully developed specifications adopted by various municipal and highway engineering associations. Such approved specifications may be safely adopted, either entirely or with modifications to meet local conditions.

The initial cost of wood block paving is fairly high as compared with some other widely used types of pavement. The cost of completed pavement will range from $2.50 to $3.80 per square yard, varying with the depth of block used and with local conditions. Actual cost figures from construction of wood block pavements in Eastern Canada are:—$2.75 to $3.00 per square yard for 3-in. block pavement, $3.00 to $3.40 per yard for 3½-in. pavement, and $3.25 to $3.70 where 4-in. blocks are used. On the Pacific coast the cost of wood block pavements is somewhat lower than that indicated by the above figures. Transportation charges on treated blocks and the cost of actual pavement construction are the more important variable factors, and these may be estimated closely for any particular local conditions. However, admitting the relatively high cost of wood block paving, it must be realized that ultimate cost, estimated on service performance, and not initial cost only, is the fair and logical basis of comparison of various paving materials. On such a basis the economies of wood block paving for many conditions of use are strikingly apparent. Creosoted wood block paving is not recommended for universal use. There are many conditions where it would not be possible to realize in service its maximum possible economy. But where durability, comparative noiselessness and ease of cleaning are pavement requisites of first importance, it has a strong claim to first consideration.

Woods Suitable for Block Paving

With reference to the various wood species which have been successfully used for creosoted wood block paving, it may be noted that a considerable number of woods have been proved to be adapted to such service. In England, Baltic pine has been used most extensively and with excellent results. In the United States the woods now in general use for paving are southern yellow pine, Norway pine, Douglas fir, hemlock, tamarack and black gum. In Canada Norway pine, Douglas fir, and tamarack have been used most largely, and with good results. In the Canadian west, Douglas fir and possibly hemlock and tamarack will furnish the supply of timber stock for wood paving, and it is safe to assume that there will be a marked increase in the use of woods for such purpose. In Eastern Canada, the logical choice of native timber for paving block stock is Norway pine. This species is so well known to members of this association that descriptive comment is unnecessary. However, it may be of interest to note that in structural and physical characteristics this wood resembles rather closely the Baltic pine of Europe, the merits of which for wood paving service have been so conclusively demonstrated in England. Norway pine, as previously noted, is already widely and favorably known as a wood paving block timber, both in the United States and Canada, and the growing recognition of its merits for this purpose will undoubtedly lead to its much more general use in this country.

It has not been the purpose of this paper to offer any detailed discussion of the more technical features of this particular field of wood preservation, but rather to indicate in a general way the present status of creosoted wood blocks as a modern paving material. It may be noted that this case is but one of many in which the development of methods of preservative treatment has made possible the more efficient and economical use of timber, thus enabling this oldest and most important of structural materials to hold its place under modern requirements.

The features of the wood block paving situation of direct interest to Canada may be briefly considered in summary. This type of paving has been very successfully developed and widely adopted in other countries. Its merits have been proved such as to warrant its extensive use in countries where the necessary timber stock must be imported. Wood paving has been used sufficiently in Canada to demonstrate that it is perfectly suitable for climatic and traffic conditions here. Canadian highway engineers are in a position to benefit by the results of experience where such paving has been more widely used than in our own country. Detailed standardized specifications representative of best present practice may be safely adopted. Canada has large and immediately available supplies of timber suitable for this purpose. The successful development of creosoted wood block paving has opened a large field for the logical and economical utilization of a part of these timber resources. Never before in the industrial history of this country has the necessity for the most efficient development of our natural resources been more generally appreciated than at the present time. The possibilities of creosoted wood block paving are therefore entitled to very careful consideration.

Mr. Robson Black, secretary of the Canadian Forestry Association, addressed the Science Undegraduates' Society of McGill University, Montreal, on March 22, on "The Progress of Forest Protection in Canada." Referring to the work of the St. Maurice Forest Protective Association, he stated that if the fire prevention system were adopted in other parts of the Dominion it would result in an immense saving. Canada had not sufficiently recognized the importance of her wealth in forests as compared with other natural resources, although there was now an inclination to regard more seriously the question of forest conservation. The Dominion was behind European countries in adopting means to protect her forests, but ahead of the United States in this matter.

California, the Inland Empire, and the Pacific Northwest States again produced over 8,000,000,000 feet of lumber in 1914. This, however, was a loss of 735,000,000 feet, or eight per cent. as compared with 1913, in this important lumber-producing region, embracing Washington, Oregon, California, Idaho and Montana. The yield was about the same as in 1912. The figures represent returns from 1,359 active sawmills in 1914, or 73 more than reported in 1913. In Washington the loss was 646,000,000 feet, in Oregon 280,000,000 feet, and in Montana 40,000,000 feet. In Idaho and California the production increased.

The Reader's Viewpoint on Trade Topics

Immigration into Canada After the War—A Serious Problem to Solve—Douglas Fir Popular in India

Articles or letters to the Editor of the Canada Lumberman, dealing with trade conditions, or discussing questions of interest to manufacturers, wholesalers or retailers of lumber are always welcomed by our readers. Here are a few that have been received lately:—

Canada's Problems After the War

Editor Canada Lumberman:— Toronto, March 10, 1916.

Before the tremendous task of the Allies is finished, can thought be spared for what will follow upon peace?

Assuredly it should be, if what then must happen bears as importantly upon the future of the British Commonwealth as the war itself, and if, by taking thought we can in anywise direct events.

One hears, not without admiration, that Germany is already organizing for the revival and extension of trade, when trade becomes again possible to her. If, in the face of certain and crushing defeat, this is the temper of Germany, can we grudge time, labor and money for a matter still more vital?

The war must be followed by such poverty as the world has never known, and by a widespread impulse to escape from debt-laden countries to other lands; at one stroke to shake off a crushing burden of obligation, and become sharers in wealth that the war has left untouched or possibly increased. May it not be reckoned upon with certainty that the emigration from England and the continental countries will only be limited by the capacity of ships to carry the people? If this be true, will not the years after the war be important beyond measure to Canada? We have it in our power to control, restrict, encourage the stream of immigration; to fill up the empty places with English, Scotch and Irish, or with an indiscriminate horde from war-ruined Europe; to secure for Canada an Anglo-Saxon backbone, or allow it to become a conglomeration of nationalities? The choice is given us now; it will pass, and is not likely to return.

The United States, easily the richest country in the world, offers powerful attractions, nor are signs lacking there of an intention to discourage a certain class of immigration, which will naturally be diverted to us unless we guard ourselves against it. The double tendency will operate,—to force upon us what we do not want, and withhold from us what we desire.

The Argentine will also exercise a pull upon the people from the British Isles, and Canada must be hospitably ready, and well prepared, if the men of our race are to strengthen us and not be lost to the flag.

The great westward movement cannot be stayed; but it may be guided to a destination, and the considerations which will determine that destination are very plain. There must be prospect of work, a chance of better conditions, and some assurance that existence can be maintained till a new career is entered upon. Only the last point need concern us; there is no doubt of the country's ability to sustain a vastly greater population.

Immigration will be less critical than in the past. Fleeing from intolerable misery and starvation (would that it might not be so, but who can doubt it?) they will gladly accept any opportunity of earning their bread. A large proportion of those who seek a new home in Canada must go upon the land, and it would be cruel to them, and unfair to ourselves, to suggest that they could be otherwise provided for. Warned as to this they will be ready for the adventure, but will they be fit for it?

Most of them will lack experience in agriculture, and all in the conditions and customs of a new country. But it would surely be possible, and in a very short time, to qualify the class of immigrants referred to, as farm hands, at a cost quite trifling when measured by the result to themselves and to Canada. Barracks or cantonments with suitable land might be provided in all the provinces where the elements of farming could be learned, and something of the local ways.

These would be depots for labor required in the neighborhood, and men could be drafted out when and where required. It is a manner of life with which the war would have made most of them most familiar. Those with a little capital would be supplied with information to guide them as to settling in the different provinces, and if they could be to some extent financed in their ventures, it would be a use of public funds bringing with the years an increased return. Authentic accounts of labor situations everywhere would be circulated from a central bureau, which would be charged also with the discovery of employment for mechanics and domestic servants of all classes. Existing institutions, while they are quite unable to deal with so broad a scheme, could co-operate effectively in some respects.

These camps, efficiently conducted, would partially support themselves; they would bridge over the weeks or months when an immigrant is finding his feet and seeking for work under strange skies,—ensuring him at least a roof over his head during this depressing time, and the results attained and the reports made would regulate the amount and kind of immigration.

It is said that our hospital and commissariat systems approach perfection. If we can organize for war, and the purpose of war, can we not organize for peace and for the sake of the generations to come?

Were France to contribute to this tide of humanity nothing could be more fortunate for us, and I doubt not that her sons would receive a like welcome in Canada.

The question is worth thinking about. Should this bring the conclusions that millions will soon be seeking new homes across the ocean, that some of these will make better citizens than others, that we want the best, and particularly those of our own blood, we can hardly stop at that point and dismiss the matter from mind. It is absurdly unlikely that we will get what we want without working for it. There is no warrant for believing that Providence favors Canada to the extent of putting itself about to do what Canadians are not willing to foresee and ordain for themselves.

Were Germany in our shoes she would not trust to luck, and those who scorn to borrow ideas from Germany have learned but little from this war.—Canadian.

*Editor's Note.—Written by a prominent resident of Toronto upon his return after passing the winter in England, where he has had exceptional opportunities of observing conditions as they exist.

B. C. Shipping Problems—Trade Improving

Editor Canada Lumberman: Vancouver, B. C., March 8th, 1916.

Just a few lines from Vancouver and the West Coast of B. C. re export lumber trade.

At present the export demand for lumber is good, but we have no boats in which to ship this lumber. The B. C. Government have under advisement a plan to build possibly ten boats, but whether or not these plans are carried out at this session of parliament remains to be seen. It is proposed to build wooden sailing ships with auxiliary power, these boats to have a carrying capacity of 1½ million feet of lumber. A very large concern from the East have made the Government a proposition to build anywhere from ten to one hundred boats on a tonnage basis, claiming that they would deliver the first boat within four months and others to be delivered every few months thereafter until the demand is supplied, but I am afraid we are not in a position to accept this offer at present.

While we are on the subject of boats we may say:—If some of our boat builders in Eastern Canada would turn their attention to this section I am satisfied they would find a new and rich field to explore. In short, we have the timber; the mills can furnish the lumber on short notice, and there is a demand for every foot of lumber that can be cut, running the mills at full capacity. To justify this action we may say that the rates are sufficiently high at this time—and will be for the next few years—to encourage independent ship-building. We cannot hope, however, to secure all the boats we need without Government aid.

The lumber business generally is decidedly better than it was five or six months ago. The price of lumber has advanced $4 per M. since my last communication, and the mill men are very much encouraged. The demand for standing timber naturally follows and a number of deals for immediate logging purposes have been made this year, and other deals of a speculative nature are now under way. Everything considered, we all feel encouraged, and if we can solve the problem of securing bottoms there will be a revival of business beyond our most sanguine expectations. Especially will this be true if the war terminates within a reasonable period. The demand for lumber from the Prairies has been in excess of anticipations.—C. S. Battle.

A Busy Season for B.C. Plants

Editor, Canada Lumberman:— Vancouver, B.C.

A contract was made in December with a London firm to supply about twelve hundred tons measure of box boards. The Canadian Pacific Railway Company very kindly met us in the matter of freights and made a through rate from the coast to London, which enabled us to take on this business.

A little later on an inquiry for 320,000 ammunition cases required by the Imperial Government was placed before the British Columbia box manufacturers by the Forestry Branch of the Province, and after considerable negotiations back and forth with the Imperial Government authorities and the C. P. R. freight department, the business was finally undertaken.

The two orders mentioned kept the box factories going throughout the months of December, January and February. Some have not as yet fully completed their portion of the business.

On account of the great cost of getting the box boards to the United Kingdom there is but little prospect of our continuing to do any considerable volume of business in that market; there is, therefore, no present occasion for the B. C. box-makers to increase the size of their plants.

A large volume of orders for all grades of lumber, also shingles, is now coming in to the coast mills from Alberta, Saskatchewan, Manitoba and

Ontario. I do not think that the demand from these provinces has been better at any time during the past five years.

The government of this province has just announced that legislation will be brought down immediately to assist in the building of wooden ships, suitable for lumber carriers. The Legislature is now in session and we are expecting to be in position to undertake the construction of two ships almost immediately. Some of the ships which will be built under the government plan should be completed by autumn. The timbers and general lumber which will be required for the construction of the ships and the preparing of cargoes therefor by the time they are completed gives every prospect of a busy season for coast mills.

Cameron Lumber Company, Limited,
J. O. Cameron, President.

In the Public Eye

A budget of comment on men and things of moment presented in the interest of our readers, independent of party politics and with malice toward no one.

Many of my friends have been wondering what has become of me recently, and enquiring about my silence. I have not been asleep; on the other hand I may tell those who have made enquiry that I have been very much awake, watching with wide open eyes the course of events at Ottawa, and I have seen the storm clouds gathering for an outbreak that is likely to end at an early date in a political cyclone. But what was the use of continually hammering away and telling about crooked letting of contracts for shells and shell boxes? I just got sick and tired of the job for a while, but I could see the chickens poking their heads over the horizon on their way home to roost, and so I settled down for a time to wait until they began to flutter into the government coop and start something. Have not a good many of the flock reached home now, and are not others on the way?

"I told you so"—that is the way I feel about it all just now. When I began saying things about profiteering and crooked contracts generally in connection with supplying war materials, perhaps some of my friends thought that I was going it pretty strong. I only wish I could have gone it a good deal stronger. As it is, however, this paper takes a good deal of pride in the fact that—at a time when the public knew very little about the real state of affairs—it was the first paper in Canada that had courage enough to come out clearly and draw public attention to what the Shell Committee was doing—from that day to this, every single day has been adding to the justification of our course.

* * *

Today we are told on the responsibility of a member of parliament that things appear to be even more rotten than we had thought. The latest charges are briefly as follows:—

That while Canadian firms were unable to get contracts for the production of time fuses, two United States companies, which were simply middlemen, received fuse orders amounting to $23,000,000 and were given cash advances amounting to $3,252,900 as a so-called inducement for taking the contracts;

That one of these companies was the American Ammunition Company, a mushroom company, with capital of $1,000, having no plant, which received orders for about $12,000,000 worth of fuses and an advance of $1,565,400 in cash;

That the other company was the National Arms and Fuse Company which got a contract for $11,250,000 worth of fuses and an advance of $1,687,500, being also a mushroom company, with capital of $3,000, and no plant.

The charge is also made on the same responsibility that one E. B. Caldwell, president of the International Arms and Fuse Company; one B. F. Yoakum, New York, and one E. N. Bassick, Bridgeport, Conn., entered into a written agreement to divide $1,000,000 for getting contracts from the shell committee, before such contracts were in writing.

Also on the same responsibility the charge is made that Col. J. Wesley Allison was in an agreement with Yoakum and one Eugene Lignanti, an orchestra leader of Montreal, to secure contracts, and that Lignati disposed of his one-tenth interest for $50,000.

And lastly, in connection with these matters, it is charged by the same member of parliament, that Sam Hughes gave his formal approval of Allison's transactions.

* * *

Are not the indications pretty strong that the government we have in Canada today is about the rottenest we ever had, and that it is led by the weakest leader that has ever been at the head of a party during the whole history of Canada? While we in Canada have been straining every nerve and every muscle to do our share as a part of the Empire, to lead cleaner lives, and to assist in the great task of saving the Empire from its foes, have our representatives in Parliament been wallowing in the lowest and dirtiest of profiteering filth?

Those who give their allegiance to the Conservative party have a sore trial to face. Those who are clean and honest must insist on a new leader and a number of changes in the cabinet. Far better for them to go to defeat with a clean heart and clean hands than to share in the dirty work of their political friends. I repeat that the evidence is growing stronger that Sir Robert Borden is the leader of the rottenest government we have ever had; that he has failed to hold his pussy footed followers in check, and that he must therefore give way to someone who will do so.

* * *

There are many other things besides these war contract matters which the country want to learn about. Many of us would like to know, for instance, about the lot of Canadian officers now in England, some 1,500 I am told, who are doing nothing so far as we can learn, but are drawing their pay just the same—living at the expense of the country.

* * *

Now that possibly the most strenuous period of the war is over, the Government seems to be willing to make something in the way of a bluff at protecting the Canadian people, by appearing to prohibit the export of nickel to our enemies. Just what this bluff is based upon we may not know, but it is said that the government's nickel policy is really controlled by two ministers, one at Ottawa and one at Toronto. I do not know about this, but would like someone to ask the government about it.

* * *

In conclusion, I do not think that the Conservative party is the only one in need of a new leader. A new leader for the Liberal party would be a good thing too. I doubt very much whether the Liberal party will ever get anywhere with Sir Wilfrid Laurier as its leader.

SEARCHLIGHT.

Export Markets Should be Worked More Thoroughly

Editor Canada Lumberman:— Calcutta, India, February 5, 1916.

Your issue of November 1 just arrived, the first I have seen for months. It is excellent. I wish your paper went to all the big lumber importers in foreign countries. I have actually run across many who express doubt that Canada is as good a market to buy lumber in as the United States. That they believe the United States better, regardless of what they say, is shown by the fact that in nine months, in five countries, I have only run across (in an expedition which has brought me in contact with all the lumber importers, too) four importers who send enquiries direct to Canada either for lumber, timbers, doors, shooks or other wooden articles. They all prefer to have their foreign buying agents in the United States.

Now is the time to combine sentiment, business and our productive capacity and start a change.

I see B. C. Douglas fir is suggested for shell boxes in Canada. You will be surprised to learn that Douglas fir has been the favorite wood in India for ammunition boxes for some months. "A prophet is not without honor save in his own country."

Keep the good work going, but why don't those manufacturers, whose capacity you so convincingly portray, export doors and box shooks instead of letting the United States do all the trade in South Africa? They can get bona fide enquiries any day from the Canadian Trade Commissioner, Cape Town, South Africa. I sent some in myself.—H. R. MacMillan.

Cape Breton Trade Conditions

Editor Canada Lumberman: Sydney, C. B., March 15.

During the past year the consumption of lumber in Cape Breton was not so large as for several years previous, and the production has been larger; consequently the imports have been less and the exports about the same as in 1914.

The building trade in the city and towns was not active, but the farming and fishing sections showed about the same activity as in recent years.

A large pulp mill is under construction at St. Anns by the Cape Breton Pulp Co., and it is proposed to begin operations during the coming season.

On account of the scarcity of small lumber carrying vessels and the high rates of freight, it is not likely that much lumber will be shipped to the United States this season.—R. R. Chappell.

Quick Results

Editor Canada Lumberman: Buffalo, N. Y., March 22.

We note with a great deal of satisfaction that the campaign you made last year in regard to the inspection of Canadian hardwoods has very evidently borne fruit. We notice this in our own business and are able to buy considerably more stock there this year than we have in the past. **It should be a source of gratification to you that you are able to make your influence so quickly and strongly felt.**

Yours very truly,
Blakeslee, Perrin & Darling.
Chas. N. Perrin, Sec'y.

Opportunities for Canadian Lumber in France

A memorandum on the importation of Canadian lumber into France, prepared by a wholesale lumber firm in Havre, has been forwarded to the Department of Trade and Commerce by Mr. Philippe Roy, General Commissioner for Canada in Paris. Canadian lumber exporters, the report says, have an excellent opportunity just now of opening up a large trade with France and replacing the lumber formerly imported from Sweden and Norway:—

The firm in question, as is the case with all French concerns known as dealers in lumber from the Baltic, is exclusively interested in the importation and sale of lumber for building purposes. Their requirements have been so far entirely taken care of by importing Baltic lumber, that is to say, from Sweden, Norway, Finland and the Baltic provinces of Russia. The articles of agreement for the purchase of timber from Sweden or Russia are the types of contract acceptable. The only difference between the contract in Sweden and that in Russia lies in the fact that the former stipulates prices f.o.b. and the latter c.i.f. quotations.

Requirements of Contract

The principal clauses are as follows:—

Standard of sale—Petrograd standard (165 English cubic feet).

Dimensions. Thickness and width in English inches, as follows:

4 x 9	2½ x 6½	1½ x 9	1 x 9
3 x 11	2½ x 6	1½ x 8	1 x 8
3 x 9	2 x 6	1½ x 7	1 x 7
3 x 8	2 x 5	1½ x 6	1 x 6
3 x 7	2 x 4½	1½ x 4½	1 x 5
2½ x 7	2 x 4	1½ x 4	1 x 4½
			1 x 4

Length—In metric figures, i.e., from 33 by 33 centimetres.

Price—In francs or pounds sterling at a fixed rate of exchange determined by the contract, c.i.f. as mentioned above.

Payments by draft accepted by the buyer, against documents at three days' sight, without discount of 2½ per cent., or at four months, at the option of the buyer. These conditions imply great confidence on the part of the seller and were very liberally offered by the Baltic exporters, which explains their almost complete capture of the lumber trade in northern and western Europe.

Grades 1 and 2 are equivalent to grades of sale in France known as Joiners 1 and Good Joiners 2. Grades 3 and 4 are similar to the grades of sale in France known as Good Scaffoldings and Scaffoldings.

Canadian lumber is not unknown in France. At the time of sailing vessels the importation was even very active, thanks to the higher rates of freight and the utilization of this lumber in naval construction. As soon as the use of iron began with the appearance of steam vessels, these favorable conditions disappeared.

Moreover, at the same period, Swedish exporters, with the encouragement of their Government and with a degree of ability and daring which must be admitted, laid plans for the utilization of their forests, the enlarged production of their sawmills and the extending of their banking system, and thus secured the complete mastery of the trade in building timber in all the countries located on the North Sea, the Atlantic Ocean and western Mediterranean.

Canadian imports into France were reduced to the appearance in French ports of small consignments in the years in which the Baltic production was inferior to the needs of the general consumption. One of the other reasons for the commercial supremacy of this production over that of Canada is the organization adopted by the Swedish sawmills for the sale of their products.

These Swedish sawmills are represented in France by general agents residing in Paris, who cover from there all the French ports. These agents deal either on behalf of the sawmills, or in their own name, and guarantee to the buyer the execution of the contract. This habit of applying to Paris agents has become such an established custom with lumber importers in France, that the few deals in Canadian lumber which have been transacted have been arranged through these agents.

Canadian Opportunities

Few cases are known where deals have been closed direct between Canadian lumber mills and French importers. If producers in the Dominion desire to extend their connections with France, they would have every interest in opening agencies in Paris. These relations can all the better be developed as the difficulties of importing Baltic lumber since the beginning of the war have induced French lumber dealers to renew their relations with Canada. Moreover, after hostilities cease the requirements in construction lumber will certainly be considerable and will exceed the Baltic production, especially if it is remembered that the port of Riga which exported yearly nearly one-fourth of this lumber, has suffered from the fact that the forests of its back country have been destroyed by war; that sentiments which were dormant have been awakened by our mutual trials and co-operation, adding new life to the old sympathy which has united France and Canada.

With the exception of spruce lumber of quite superior grade, Canadian fir cannot compete in France with other varieties of lumber known as Riga, and will thus always have to be quoted at prices slightly lower than lumber from Sweden.—Trade and Commerce Bulletin.

Wooden Goods for South Africa

Mr. W. J. Egan, Trade Commissioner, Cape Town, South Africa, has forwarded the following illustrations to the Department of Trade and Commerce as indicative of kinds of wooden flour pails, butter tubs and fawcets in demand in South Africa.

Flour pails made in wood as shown in the illustration are good sellers in South Africa. They are packed in nests of three, fifteen pounds to the nest. Finish and pattern must be as illustrated.

There is demand for a supply of wood butter tubs similar to the illustration. They arrive packed in nests of three. The sizes should be made to hold 20, 40 and 60 pounds. Usual orders amount to about 100 nests.

Wood fawcets are imported in large quantities. The fawcet shown has a polished finish and is a popular seller. The sizes stocked are as follows:—

Nos.	0	0	1	2	3	4
Lengths	6½	7	7½	8	8½	9 inches

Samples with details covering packing, weights and quotations

f. o. b. Canadian ports, if forwarded to Mr. Egan, will be submitted to South African inquirers or to prospective representatives if it is desired to place the line with local agents, which is the most satisfactory way of securing and holding trade in South Africa.

British Columbia's Fine Finish Materials

Carefully planned publicity has recently been bringing splendid results in the case of the various classes of lumber and timber produced in British Columbia. In Eastern Canada, this is especially noticeable. Canadians have always naturally wished to make extensive use of their own manufactured products whenever possible, and, in Eastern Canada, the products of British Columbia have suffered greatly in the past on account of the fact that architects, contractors and consumers knew so little about them as compared with other woods used for similar purposes. This has all been changed during the past year or two, especially since the extensive campaign of advertising British Columbia forest products was put into operation by the British Columbia Government. We have made frequent reference to this campaign in our columns and we are able in this issue to show a few attractive illustrations of British Columbia timbers and interior finish in actual use. The steadily increasing cost of many hardwoods which have been great favorites for interior finish for many years, is an important factor in the growing popularity of British Columbia woods for similar purposes. Many British Columbia woods have been found to be exceedingly well adapted for such uses.

Douglas fir, western hemlock, western red cedar, western spruce, western larch and western soft pine are becoming increasingly popular as finishing material. They have excellent wearing and time resisting qualities, as well as beautiful figures. In regard to figure they permit of two very distinct types, the flat-grain, giving a beautiful watered-silk effect, and the vertical sawn grain, a restful, pleasing, edge-grain effect.

One of our illustrations gives an idea of the appearance of the interior of the Canadian Pacific Railway Company's wharf reception

Fig. 1—Douglas Fir for Roof Supports, Finish and Floors. Wharf Reception Room, C. P. R., Vancouver.

Fig. 2—Beautifully decorated All-Wood Hall and Staircase; Douglas Fir Floor, Wall Panels and Ceiling.

room at Vancouver, in which Douglas fir was used for roof supports, finish and floors. The effect is very restful, pleasing and quiet. Another illustration shows the hall and staircase in a private residence, in which panelled walls, beam ceiling, staircase and floors are all Douglas fir, giving a homelike and exceptionally beautiful appearance. A room panelled with cedar and finished with wax polish, with an edge-grain Douglas fir floor, in its natural shade is very delightful to the eye, combining comfort, beauty and durability.

Douglas fir is a particularly suitable wood for interior finish. The stock from which interior trim is manufactured is free from knots, shakes, or other defects, and usually is cut edge-grain. The mills of British Columbia pay particular attention to good finish, all stock being thoroughly kiln-dried and carefully manufactured. This wood holds oil, stain or paint splendidly. It can also be finished in wax or varnish, either dull or polished, with good results. As a flooring material, edge-grain Douglas fir ranks easily among the best that can be obtained. It is straight-grained, hard and wear resisting, besides producing a very attractive floor. As a door stock also, Douglas fir ranks among the best. All stock for rails, stiles and muntins is cut edge-grain, and the panels are solid or three-ply rotary cut veneers.

Another of British Columbia's attractive woods for interior finish is western red cedar, the color of which, in its natural state, is a quiet, slightly reddish brown. It is straight grained, easy to work, free from checking or warping, and much in demand for the highest class of panelling for walls and ceilings. This wood is cut either flat-grain or edge-grain and takes any finish of oil, wax, paint or varnish. Cedar panelling in plain oil finish mellows down with age to a restful, pleasing effect, very suitable for libraries or dens.

Lumber Grades and Other Problems

Reflections of a Lumberman on a Few Questions of Present Day Importance to the Trade

By E. H. Newton

From time to time, the question of uniform grading of lumber products and shingles comes up, elicits the usual variance of discussion and excites the usual amount of interest given to such matters of universal preponderance, and then, as if to show our preference for living in a state of mediocrity, we allow the question to be lost sight of, and to sag back and remain in the hands of that old thief of time, whose other name is procrastination.

The Editor of the Canada Lumberman has once again raised the issue, and let us hope that those whose office places them within the proper sphere to take the initiative in such matters will not look lightly upon the subject, but rather seize it as an opportunity to do something along educational lines upon a subject where education and general instruction are badly needed.

Good Practical Rules Required

What we want is not simply a stiff and precise set of sterotyped rules gotten up with such a maximum of brevity as to make them capable of being misinterpreted, or otherwise confusing to those not well versed in the hieroglyphics or other characters used to describe lumber, and which are so well known and sometimes so confusing as to leave room for a difference of opinion even between the more practical minds. We want a set of grading rules which will describe the different grades from the highest to the lowest in detail in all their practical forms of manufacture, and also indicate the suitableness, or adaptability of each grade for any purpose not already or otherwise indicated.

Such an educational compilation of information placed in the hands of all who might be benefited by a universal and more general knowledge of the business, as well as of the purpose sought and worked out, would have a double effect, and would redound to the benefit and satisfaction of all concerned. It is a safe assertion to make that probably fifty per cent. of the business handled in lumber to-day carries some element of uncertainty, and on this account errors in filling the orders occur, or annoying delays are frequently occasioned while telegrams or letters are being exchanged, as the exigency of the case may seem to require, all of which might be reduced to a minimum if the man who writes up the business had a full and complete guide to order by, and in which might be emphasized the necessity of giving full and complete information with each order which would facilitate the application of intelligence by the mill filling it, obviate unnecessary delays and reduce almost to the vanishing point the excuse for making errors.

For the purpose of illustration I will cite a single instance which came before me recently, and which describes the modus operanda which is seemingly becoming more and more the rule with those writing out inquiries, and even orders: An inquiry was submitted to the mills for quotations, calling for a number of carloads of timbers and other specifications, much of which ran up to sixty feet in length, without indicating anything about the quality, or for what purpose it was to be used. This timber might quite properly be required in select grade, select common, or number one common, according to the purpose for which it is to be used, and yet there was no indication or information accompanying the inquiry. The local representative of the company which had submitted it was called up and asked for the information, but he could not give it, and yet the mills are expected to figure on this kind of business.

Orders Should Be Definite and Specific

Another difficulty which is increased beyond all reasonable proportion is that of demanding specified lengths where they are not needed. In most mills, and more particularly those situated in confined areas, it is much more convenient to fill orders calling for random lengths than it is those calling for specified lengths, and therefore where lumber is to be cut up into other lengths than those ordered it would be a decided advantage to the mill filling such order if it were given this information, together with the privilege of acting upon it. It surely is an unwarrantable hardship for the mill to pick over a pile of random length shiplap as is often done in order to load a car with all one length, when it is a well-known fact that in most cases random even lengths in shiplap are preferable in a building, and when it is ordered all one length some of it has to be cut in order that the joints may not all come in one place.

Easygoing Methods Lead Nowhere

I have spent quite a respectable number of years in the lumber and shingle business, and from the positions which I have occupied, with a due amount of application I have been able to camp upon the most difficult grounds until I had studied them thoroughly. Step by step and year by year I have gone along, as many others have done, watching the business in all its varying stages, and searching assiduously for the cause and effect of things as they happen. Always studying the business in the light of practicability, I have discovered many of the diverging points where thought runs off until it exhausts itself along the lines of incompatability. It is the business coming in off these branch lines which is giving us most of our worries to-day. Most of these branch lines lead off to a place called "Dontgivadamgulch," and the fellow who handles the business there is never particularly anxious to take worries into the camp, but rather prefers to pass them all on the mill.

Now, if this man could only be educated to think, and to understand more about the business in a general way, and to talk lumber intelligently and in a masterful way, very much of the existing inharmonious entanglement could be obviated. I know it is a difficult problem, but it is well worth the effort. The last thing that some men want to do seemingly is to think, and particularly is this so when you ask them to think for the benefit of someone else. Have you ever met the fellow who acts first and thinks afterwards? He is the chap of whom it is said that his "hindsight is better than his foresight." Some of those fellows are smart in a way, but it is usually only superficial. Ask them a question, and perhaps they will answer you before you have finished, but they have not thought, but answered first, and will think later, if at all.

I do not believe there is another industry in the province of British Columbia to-day, or in Canada, for that matter, which has been run in such a haphazard way, or in which there is such an opportunity for educational work as in the lumber business, but let us hope that by a united effort, order, satisfaction, contentment, and even pleasure may take the place of demoralization, which is now passing, we hope, for good.

Making Bungs and Faucets

The bung's business is to hold liquid in a barrel or keg, the faucet's is to draw it out. The making of these two small articles is treated as a single industry in statistical compilations, though they are not generally the product of the same factory. They are so intimately connected with cooperage that they are naturally classed with that industry. Though the articles are small, they call for a large amount of wood for their production. Their yearly total needs in the U. S. according to latest figures, exceeds 21,000,000 feet, and includes seventeen kinds of wood, twelve of which are hardwoods, five soft. In quantity, yellow poplar amounts to more than all others combined, as the following table shows.

Wood for Bungs and Faucets

Wood	Feet Annually
Yellow poplar	17,810,000
Maple	854,900
Beech	850,000
Red gum	325,000
Birch	305,000
White pine	287,000
Oak	250,000
Spruce	110,000
Elm	100,000
Sycamore	100,000
Walnut	56,000
Cedar	30,000
Butternut	14,600
Rosewood	10,642
Hickory	6,000
Redwood	2,000
Western yellow pine	1,200
Total	21,112,342

More barrel bungs are made in Ohio than in any other state and almost as many as in all other states together. That state's total bill of bung wood is 10,084,000 feet, nearly all of which is yellow poplar. The industry is centered in and around Cincinnati where it has grown from a small beginning many years ago. This is doubtless due to the fact that Cincinnati has long been a cooperage center. During early years when the Cincinnati coopers obtained their white oak staves in southern Ohio and in the adjacent parts of Indiana and Kentucky, the yellow poplar for bungs was procured in the same region and most of it within twenty-five miles of the city. But that time past long ago. They now bring staves from Arkansas and Mississippi and yellow popular for bungs from West Virginia and eastern Kentucky and Tennessee.

It might be supposed that the bung being small, one wood will do as well as another. Such is far from the case. Some of the demands are exacting. The wood must be straight-grained, soft, strong, easily worked ,and it must not sheer easily. It must possess a uniform structure so that the wood will make a uniform contact with the wood

around it. Hard and soft streaks in a wood spoils it for bungs. It must not be sufficiently porous to permit seepage. It would be poor economy to pay high prices for white oak staves in order to get a non-leakable wood, and then use a bung through which leakage may take place. Yellow poplar meets these requirements so well that it has been accorded first place as a bung wood in competition with all the timber of this country.

The wood represented in the foregoing table is worked into faucets as well as bungs, but the material going into the two articles is not separately tabulated and the line between bungs and faucets cannot be drawn in a way to show how much each uses. It is known that bungs take more than half.

Faucets are made in many parts of the country, and for drawing from barrels and casks liquids of numerous kinds. There is some choice of woods, but many are suitable. Prejudice for a long time controlled the making of faucets, for it was once supposed that the faucet exercised a good or a bad influence upon the liquid which passed through it. That superstition was not confined to any particular part of the country; but it has about died out under the influence of better education among the people. However, it is said that to this day country merchants in some rural districts insist on having applewood faucets for vinegar barrels, because some of their customers will not buy vinegar which is not drawn from the barrel through a faucet of applewood.

That is a survival of the old superstition that applewood improved cider and vinegar by contact with it.

Decreased Lumber Consumption

One of the direct causes of depression in the lumber industry is a decreased consumption of lumber, which is perhaps more to blame than an increased production. Just how much this consumption has decreased per capita is shown in some data that have just been worked up on this subject. In 1905 the per capita lumber consumption of United States was 334 board feet; in 1909 this had increased to 474 board feet per person, but in 1913 this amount had decreased so materially that only 362 feet were consumed. The figures during the past ten years are as follows:

1905—334 board feet per capita.
1907—434 board feet per capita.
1909—474 board feet per capita.
1911—377 board feet per capita
1913—362 board feet per capita.

A careful study of these figures will point out to the lumbermen wherein lies their only hope of permanent betterment of trade. New and increased uses for wood, based on an exact knowledge as to when and what wood is best suited for the purpose at hand, it is believed, can be developed to the point which will raise the per capita consumption, hence the total production, sufficiently to make the lumber business a continuously profitable and stable industry. Reaction from the extensive promotion work on the part of the substitute building materials people during the past five years, is beginning to be manifested in a return to wood, recognizing it as the most economical type of construction, embodying at the same time the maximum of beauty and utility.—Bulletin of the West Coast Lumbermen's Association.

The Bonus System in Making Shell Boxes

In one of the eastern plants making shell boxes a bonus system has been introduced that has produced good results.

First, the number of times a given operation can be performed in a day has been ascertained as nearly as possible. Then an hourly rate is fixed on this basis, and the operator encouraged to get the best possible out of his machine. Payment for results is made as follows: of all that is produced over the fixed rate the man is paid half and his employer takes the other half. If the operator does not succeed for any reason in making any bonus he is still paid his regular hourly rate. For example, suppose the rate for an operation is 35 operations per hour, and in one week of 50 hours he makes 2,500, which is 750 over the fixed rate, the operator is paid for 375, or 21½ per cent. on his wages for the week. If it is found that a helper would assist the output of a certain operation the helper is paid a bonus the same as a mechanic, allowance being made for the helper in fixing the rate. Each week or pay period stands by itself. Care has been taken to fix the rates so that the man can make a bonus, experience having proved that if he can only make three or four per cent. he does not think it worth the exertion, and makes no effort. In order to protect the employers in case any rate of operations is fixed too low, it is stipulated that not more than fifty per cent. bonus is to be paid on any one pay.

To protect the employer against inferior work and save cost of inspections of machines the operator is only paid for material that ultimately passes the Government inspection. This makes every man see that every other man turns out good work.

The system has produced noticeable results in the way of output. On one operation that, before the bonus was introduced, took two men and two machines to get between six and seven hundred operations per day, now one man and one machine is producing just over 500 per day, an increase of almost 30 per cent. Another took five men to produce 1,000 per day; now two men produce 600 to 650 per day, an increase of 62 per cent. in each case. The operator gets half of the money saved and the employer half, but the employer gets all the increased output.

On the other hand, on some of the operations this bonus has not affected the output much, there being in some cases increases of only five to six per cent. Taking all the operations into account, both machine and bench, the increased output has been nearly forty per cent., and the bonus paid twenty per cent.

The effect of this extra speed on some of the operations has spread over all, so that the total cost has declined a little over 35 per cent. since the system has been introduced.

To get the best results there must be confidence between master and man, no cutting of rates. The rate must be fixed so that the operators can earn some bonus. The effect has been that the operator has devised many short cuts that help production and improve the grade of the work.

Advertising, the Keynote to Success for Lumber Industry

Advertising as the keynote of success in the lumber industry was the basic point of the address of Secretary R. S. Kellogg, of the National Lumber Manufacturers' Association, in an address on "Use Wood Where Wood Is Best," before the National Wholesale Lumber Dealers' Association, Wednesday, March 15, at Philadelphia.

"Advertising, lots of it, honest advertising, efficient advertising," he declared, "has made the lumber trade sit up and take notice in the last year or two and realize the possibilities that have been overlooked in years gone by, The lumber trade to-day, as a result, has revolutionized the methods of merchandizing its products, and this applies not only to the manufacturer, but to the wholesaler and to the retailer.

"The cypress and southern pine manufacturers, for example, are spending $100,000 each year in the advocating of their product. The hemlock men of Wisconsin are just starting out to spend $25,000 a year for five years in advertising hemlock. The Douglas fir, North Carolina pine, red gum, red and white cedar men are doing the same kind of work.

"But back of all this is the bigger thing, honesty and efficiency in advertising. Newspapers to-day are asking that the advertisements offered for their columns be honest. We are advocating honesty and efficiency in our own business to-day, not because of the morality of the problem alone, but because it pays to be right.

"The National Lumber Manufacturers' Association to-day is working through all its varied channels to secure efficiency in the handling of the lumber of the nation. Our manufacturers are trying to be efficient in production, we are trying to help our customers to be efficient in their merchandizing, but above all we are all working together for efficiency and honesty in advertising. We want more advertising in this business of ours. The manufacturers are advertising to help the retail and wholesale distribution of lumber, and the wholesalers and the retailers should join hands with us and spend their money in extensive advertising of the use of wood where wood is best.

"That is the one great problem in our advertising to-day, the advocacy of the use of wood only where wood is best, and of the kind of wood that is best for a specific purpose. In honest advertising we must advertise the kind of wood for a given purpose that is best fitted for that purpose. If we try to sell an inferior wood for a particular purpose, we harm not only the individual seller of this wood, but the lumber business as a whole.

"While the manufacturers are spending well toward $500,000 a year on various special advertising campaigns for special woods, we are trying to educate the wholesalers and the retailers of the country to co-operate with us not only by assisting in this advertising, but by becoming efficient salesmen. The manufacturers are advertising to make a market for lumber for the dealer, and the manufacturers are helping in this campaign by raising the standards of the various kinds of lumber, and trademarking much of it, so that the man who buys a stick of wood knows that its quality is backed by a big manufacturers' organization, pledging its faith that this stick of timber will do what is claimed for it.

"The manufacturers are helping the dealers not only in this way but by sending out travelling exhibits, engineering bulletins, and aiding the dealers to secure the most reliable information about the qualities of the lumber they handle.

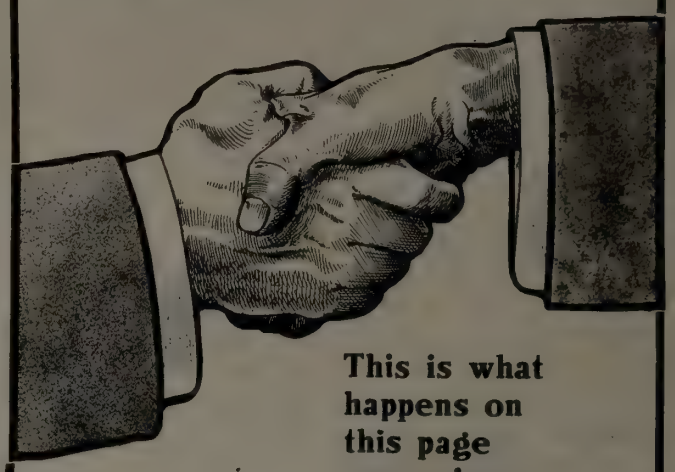
"Now, in co-operation with the manufacturers, we believe the dealers can help themselves by becoming authorities upon building construction in their home cities, spreading information on the various uses of lumber, co-operating with manual training schools, meeting mail order competition with superior goods and service, and by going into the broad problems of community development; in other words, becoming building experts for their home communities."

WANTED & FOR SALE DEPARTMENT

Mr. Buyer

Are you in the market for a special bill of lumber? Would you like to pick up a real good second-hand planer or perhaps some logging equipment? Have you a vacancy in your plant for a filer or other employee? If you answer "Yes" to any of these, advertise on this page. It is the "Master of Ceremonies" and will introduce you to the man you want.

The Master of Ceremonies



This is what happens on this page every issue

Mr. Seller

You are looking for the man who is looking for you—you have for sale what he wants. All that is needed is an "Ad" on this page to bring you together. Appeal to this "Master of Ceremonies" and send us a small ad. today. What can we sell for you—or perhaps we can find you a job.

Send along your ad.

PUBLISHER'S NOTICE

Advertisements other than "Employment Wanted" or "Employees Wanted" will be inserted in this department at the rate of 15 cents per agate line (14 agate lines make one inch.) ($2.10 per inch) each insertion, payable in advance. Space measured from rule to rule. When four or more consecutive insertions of the same advertisement are ordered a discount of 25 per cent. will be allowed.

Advertisements of "Wanted Employment" will be inserted at the rate of one cent a word, net. Cash must accompany order. If Canada Lumberman box number is used, enclose ten cents extra for postage in forwarding replies. Minimum charge 25 cents.

Advertisements of "Wanted Employees" will be inserted at the rate of two cents a word net. Cash must accompany the order. Minimum charge 50 cents.

Advertisement must be received not later than the 10th and 26th of each month to insure insertion in the subsequent issue.

Wanted–Lumber

Lumber Wanted

Soft Elm, Ash, Maple, Birch, Beech, Basswood. Dry or new cut. Cash when loaded. Box 373, Canada Lumberman, Toronto, Ont. 6-7

Cedar Wanted

Good cedar for boat building. Best prices paid for the right material. Write for particulars. The Peterborough Canoe Company, Limited, Peterborough, Ontario. 6-9

Red Pine Wanted

Wanted to buy a stock of Red Pine. Apply Box 363, Canada Lumberman, Toronto, Ont. 6-8

Hemlock, Pine, Basswood

Wanted to buy one million feet Hemlock, also 1-inch Cull Pine and 1-inch Cull Basswood. Box 364, Canada Lumberman, Toronto, Ont. 6-8

Lumber Wanted

Wanted several cars maple, beech or birch squares 1, 1⅛, 1¼ in. x 42 to 60 in. in length. Write for particulars. J. Finlay & Sons Co., Norwood, Ont. 5-8

Basswood Wanted

Wanted 200,000 feet of 1-inch White winter cut Basswood to grade No. 1 Common and Better, to be plump 1-in. thick when dry. State price F. O. B. cars shipping point. Address, Box 308, Canada Lumberman, Toronto, Ont. 4-t.f.

Basswood and Hemlock

Wanted to buy: inch cull Basswood, and 1 in. and 2 in. Hemlock. Apply M. Brennen & Sons, Hamilton, Ont. 7-8

Logs Wanted

Several cars Rock Elm logs. Quote price to St. Marys Wood Specialty Company, Limited, St. Marys, Ont. 4-7

Wanted

We are in the market for a large quantity of 2-in. Spruce Plank 4 in. and up wide, 8 feet and up long. Good merchantable stock. Kindly write us your lowest price. Box 334, Canada Lumberman, Toronto, Ont. 5-t.f.

Wanted

Several cars 16/4 Birch, No. 2 common and better grade. Must be dry and ready for immediate shipment. Write us your lowest price and full particulars. Box 333, Canada Lumberman, Toronto, Ont. 5-t.f.

Wanted

Wanted for shipment whenever in shipping condition:
2,000,000 ft. 3 in. No. 1 Com. & Bet. Soft Elm.
1,000,000 ft. 2½ in. No. 1 Com. & Bet. Soft Elm.
1,000,000 ft. 2 in. No. 1 Com. & Bet. Hard Maple.
500,000 ft. 2½ in. No. 1 Com. & Bet. Hard Maple.
Box 332, Canada Lumberman, Toronto, Ont. 5-8

Spruce Pulpwood Wanted

Spruce Pulpwood wanted of good size, merchantable quality, four-foot peeled preferred, on cars shipping point. Box 323 Canada Lumberman, Toronto, Ont. 4-7

Wanted

200,000 ft. 3-in. No. 1 Common and Better Soft Elm.
200,000 ft. 2-in. No. 1 Common and Better Soft Elm.
200,000 ft. 4/4 No. 2 Com. and Bet. Basswood.
200,000 ft. 8/4 and 12/4 No. 1 Common and Better Hard Maple.
100,000 ft. 4/4 No. 2 C. and B. Brown Ash.
200,000 ft. 4/4 Crating Elm and Basswood.
Will contract now to take stock when in shipping condition. Box 380, Canada Lumberman, Toronto, Ont. 7-7

For Sale–Lumber

Hemlock Ties

FOR SALE—Considerable quantity of hemlock ties suitable for Electric Railways, Sidings, etc., ready for immediate shipment. Monteith Bros., Rosseau, Ont. 6-10

Poplar For Sale

For sale two cars 1-in. Poplar cut March, 1915. Enquire by letter to Knight Bros. & McKinnon, Limited, Box 569 Cobalt, Ont. 4-tf.

For Sale

65,000 Feet GOOD DRY B. C. FIR

2½ to 5 in. thick by 6 to 12 in. wide. 60 ft. to 78 ft. long. Immediate delivery. George Kersley, 224 St. James Street, Montreal. 7-10

Lumber For Sale

200 Pieces 1 x 15 and up 22 ft. Cypress.
375 Pieces 1 x 15 and up 24 ft. Cypress.
Clear for boat building, in stock at Montreal.

GEO. C. GOODFELLOW,
Montreal, Que.

For Sale–Machinery

Hoist For Sale

For sale cheap, steam hoist for loading logs. Apply to Cain Coal Company, North Cobalt, Ont. 6-7

For Sale

About 200 9/16 in. Boom Chains, and about 600 ½ in. Boom Chains. 1 set Pine Storage Booms of about 100 pieces, with ¾ in. shackle chains, and 1 set Pine Storage Booms of about 100 pieces with ⅞ in. shackle chains. Also a quantity of White Pine and Hemlock Booms. Box 379, Canada Lumberman, Toronto, Ont. 7-7

Producer Gas Engine

For sale, second hand 45 H.P. Producer Gas Engine with gas producer, air pump for starting, blower, and small gasoline engine complete and in good condition. Burns pea coal, could be operated at a cost of about $1 per day. Will be sold at a very low price. Canadian-Warren Axe & Tool Company, Ltd., 7-10 St. Catharines, Ont.

Machinery For Sale

A small "Ad" under this heading, telling of what machinery you have for sale, will immediately put you in touch with buyers. Send us a list of machinery items and we will quote you on a small "Ad." Send the list now, before you forget about it. 1-t.f.

Engine For Sale

Corliss Engine, 150 H.P., 18 cylinder, 24 inch leather belt, with pump, first class condition, no fault, changing to Electric. Inspect at Guelph Lumber Co., Guelph, Ont. 5-8

Planer and Matcher

Berlin No. 94 Planer and Matcher in good condition, with furring attachment and six circular saws. Capacity 100 feet per minute. Also two sets of thin knives, one set of matcher heads, one set of square heads, one jointer bar and overhead countershaft. Price, $750.00 f.o.b. Drummondville. Reply Campbell, MacLaurin Lumber Company, Limited, Drummondville, Que. 6-7

Wood-Working Machinery

1—36" Crescent band saw, A1 condition	$75.00
1—24" Cowan double surfacer, A 1 condition	375.00
1—8" Crescent jointer	75.00
1—Variety saw table, iron	85.00
1—Wood frame, 8 ft. saw table	60.00
1—Combination drill and mortiser, McGregor-Gourlay, 4" stroke, table ¼ x 5½, raise and lower 12", side movement 10", knife 1" wide	50.00

Pollard Manufacturing Company, Ltd.,
5-8 Niagara Falls, Ont.

Wanted–Employment

Advertisements under this heading one cent a word per insertion. Box No. 10 cents extra. Minimum charge 25 cents

Wanted position as band saw filer, long experience and good references. Box 300, Canada Lumberman, Toronto, Ont. 3-7

BAND SAWYER wants position, left hand mill. Good references. Box 335, Canada Lumberman, Toronto, Ont. 5-8

BAND SAWYER wants position. Three years' experience on double and two on single cut. First class recommendations. Box 342, Canada Lumberman, Toronto, Ont. 5-7

LATH MILL MAN wants position to run a lath mill by the day or per thousand. Will go anywhere; ten years' experience. Reference. Box 369, Canada Lumberman, Toronto, Ont. 6-8

BAND SAWYER wants position, single or double cut, best of references and sober. Box 383, Canada Lumbarman, Toronto, Ont. 7-7

BAND, RESAW OR ROTARY SAWYER wants position. Six years' experience; sober and good references. Box 353, Canada Lumberman, Toronto, Ont. 6-9

BAND SAW FILER wants position, double or single cut. Twelve years' experience, first class references. Box 317, Canada Lumberman, Toronto, Ont. 4-9

EXPERIENCED LUMBERMAN wants position in lumber factory. Can take full charge of same and understand all the different machines, also filing. First-class references. Box 358, Canada Lumberman, Toronto, Ont. 6-8

DOUBLE BAND SAW FILER wants position, first-class references.

BAND MILL FOREMAN wants position, first-class millwright, and can handle men to good advantage. Box 359, Canada Lumberman, Toronto, Ont. 6-11

EXPERIENCED MANAGER—Have had twelve years' experience wholesaling American Hardwoods and Yellow Pine, thoroughly acquainted with source of supply. At present with large American wholesale concern as Manager; desire to return to Canada, and wish to get in touch with wholesaler or large consumer as buyer who has had trouble in securing Southern Hardwoods and Yellow Pine at right prices. Have also had experience shipping heavy oak and yellow pine timbers, ties and car material into Canada. Can show results, thoroughly competent to handle office work and correspondence covering buying and selling. Box 348, Canada Lumberman, Toronto, Ont. 7-7

Wanted—Employees

Advertisements under this heading two cents a word per insertion. Minimum charge 50 cents.

TIMBER CRUISER and traveller wanted. Apply Box 365, Canada Lumberman, Toronto, Ont. 6-8

GREEN LUMBER CULLER wanted for large Ottawa Valley mill. Must be experienced. Give references, experience and wages expected. Box 356, Canada Lumberman, Toronto, Ont. 6-7

MECHANIC AND SAWYER wanted for mill of 20 M. capacity in the North. Must be first class, capable and sober with full year work. Box 377, Canada Lumberman, Toronto, Ont. 7-7

WANTED—SALES MANAGER in large lumber business, sales principally to United States markets. Must be thoroughly acquainted with production and classification of Spruce lumber, rough and dressed. Good salary for suitable man. Apply Box 362, Canada Lumberman, Toronto, Ont. 6-7

SUPERINTENDENT WANTED for woodenware and wood novelty plant. Man familiar with manufacturing all kinds of wooden household articles. State experience, items you have been handling, where now employed, salary expected, etc. Give full particulars. Box 357, Canada Lumberman, Toronto, Ont. 6-7

Business Chances

Tie Contractor Wanted

Wanted a responsible contractor who would undertake to get out a quantity of ties in Ontario. Apply Box 366, Canada Lumberman, Toronto, Ont. 6-8

Planing Mill For Sale

Modern planing mill and lumber yard in growing town in Niagara Peninsula. Write Room 67, 18 Toronto Street, Toronto, Ont. 7-8

Business Opportunity

Make your opportunity knock at the door of every Lumberman in Canada by placing a small "Ad" about it in this column. Our rate is $2.10 per inch per issue. Now is a time when monied men are seeking good bargains. What have you to offer? 1-t.f.

Miscellaneous

Timber Limits For Sale

Berths No. 2 and No. 4 Nipissing, and Berth No. 4 Gurd. Hemlock, Birch, Pine and Spruce. Would sell berths separately. Close to Lake Nipissing. Great opportunity for jobbers on Nipissing berths. For particulars address Box 381, Canada Lumberman, Toronto, Ont. 7-10

30 Replies

are often received to "Wanted" and "For Sale" ads. on this page. Even 50 replies are not an uncommon return from the investment of the small amount a condensed ad. costs. And isn't that good business—to get right into close touch with so many people interested in what you have to buy or sell? For you can be sure their transactions with you will not end when they have closed the business your single ad. announced.

Build Lumber Carrier

Of the same type as that suggested as suitable to be built for carrying the lumber of British Columbia to foreign markets will be a vessel to be built immediately on Puget Sound for American lumbermen. She will be the first auxiliary powered lumber carrier to be built on Puget Sound and will be constructed at the Babare yards, at Old Town, Tacoma. She will be 215 feet over all, 42 feet beam, 14 feet depth of hold and rigged as a four-masted schooner. Although the engines have been ordered for the vessel she may make her first voyage under sail. She will be able to carry a little more than 1,000,000 feet of lumber and will cost, when completed, approximately $100,000. She will be operated in the off-shore trade, to South Africa or Australia and may be sent through the Panama Canal to New York.

Overhead a Bugaboo

Mostly every aggressive manufacturer some time in his life wants to increase his business in order to reduce his overhead charges. In many cases this is the worst bugaboo in the world. We should certainly apologize to Mr. Overhead. We do believe he is part of the cost of doing business, but when you figure out that you have a lot of waste material, and you spirited up the force to increase the number of boxes made, and if you put in ten more machines in order to increase the number of boxes turned out of the factory, you naturally would have a bigger spread to cover the cost of manufacture, including overhead. The trouble with Mr. Overhead is that when he gets to whooping in the ear of the man that he could do $100,000 more business and practically at no overhead, then we urge you, gentle reader, to diagnose all this proposition and be ready to work a new deal out, charging overhead at the same percentage as heretofore, and you will no doubt have more money than if you figure you are going to save half or three-fourths of your overhead because you have increased the capacity of one department or another.—Barrel & Box.

Logging is being hindered very much up the B. C. coast at present, as a result of storms, according to a report from Timber Inspector George D. McKay. In many cases loggers have had to make their booms up two and three times even in sheltered waters, while towing has been out of the question.

Twenty flatcars loaded with lumber from Everett, Wash., came into British Columbia recently for shipment eastward over the C. P. R., according to a Vancouver report. This is in the face of the fact that many B. C. mills are idle.

Competent Manager Wanted

A large lumber plant and mill in Toronto has an excellent opportunity to offer a man of real ability as head office manager. This vacancy has been made by the death of the late manager. Propositions of straight salary, salary and commission, an interest in the business, or even a sale of the business as a going concern, will be considered.

This is a large proposition and only the competent man of proven ability and experience need apply.

Box 374 Canada Lumberman
Toronto, Ontario

Review of Current Trade Conditions

Ontario

Although there is still nothing definite to report that is interesting, in connection with the building situation in Ontario, there are general signs of improvement today which are encouraging the lumber trade as a whole. In the larger cities, architects are beginning to see a little more light than they have for some time past. Quite a number of them report that they are doing preliminary work in connection with projected buildings, only a few of which have reached the contract stage, but a number of which are expected to do so early in the spring. In the country districts there is promise of a fair amount of building on the part of farmers.

Industrial users of lumber are far more active than they have been for some time. The furniture, implement and piano manufacturers are doing well and report that trade is improving rapidly, a situation which is making things more active for the hardwood trade. A prominent hardwood firm report that they have recently had one of the best weeks that they have experienced for a long time.

The white pine situation is also showing improvement. Along the North Shore of Lake Huron and in the Georgian Bay district, stocks are going out steadily by rail, much of them going to Buffalo, Cleveland and other lake points. When these stocks are moved by rail during the winter to United States points the situation is quite encouarging. Manufacturers in Northern Ontario have taken out a fair sized stock. A traveller who recently visited many of these firms, reports that, so far as he can estimate, the cut is about normal. They have had a favorable season for logging operations and the outlook for the drives could not be more encouraging than it is. Northern Ontario firms are also shipping fair quantities of hemlock, much of which is going to United States points.

The appearance of a considerable number of shell box orders upon the Ontario and Quebec markets is also making the trade feel more contented about the outlook. It was a long time since new shell box orders had come to light. About March 17th the Imperial Munitions Board alloted contracts for the production of a little over one million boxes of various descriptions. About 65 per cent. of these orders went to Quebec firms and the balance to Ontario firms. These will make a good demand for spruce, pine, birch and maple, in 1 in. stock, and as most of these woods are already scarce, it is likely that prices will stiffen. These orders are the result of tenders called for by the Board and a number of lumbermen who have heard details of the prices are expressing the opinion that they are a little too close to the actual cost of production and that higher prices for lumber may bring about a pretty serious situation for those who have undertaken the contracts.

Eastern Canada

The first of April will see the mills at St. John, N. B., in operation. The outlook for the present season is very uncertain as manufacturers cannot see far into the future. So far as prices are concerned there is no uncertainty of any importance, but manufacturers cannot figure on their ability to clear their stocks, as tonnage is so scarce. Practically all shipments from St. John are being handled by the Admiralty. If the present rate of shipment continues most of the stock will be moved. British buyers are not purchasing far ahead. Deals are being quoted at about $19 for an ordinary English specification. At the opening of spring, stocks of deals at St. John will be pretty well cleaned up, giving the mills clear wharves. Spruce boards are selling at about $17 to $18 for good merchantable stock. The American market is firm, but orders are scarce on account of the difficulty in making delivery, as embargoes have been placed by the railroad companies upon these stocks. Coastwise freights are high, having reached $5 per thousand for New York.

The driving outlook is promising, with plenty of snow at the head waters. Jobbers have had a good winter, although logging expenses have been a bit higher. The quantity of logs coming down the St. John will be about the same as in 1915.

The base price for spruce frames at Boston continues firm at $27. The recent embargo against lumber shipments into the United States announced by the Intercolonial Railroad is cutting off the competition of Canadian spruce and strengthening the Boston market. Random quotations are firm, present prices being: 2 x 3, $21.50 to $22; 2 x 4, $22.50 to $23; 2 x 5, 2 x 6 and 2 x 7, $21.50 to $22; 2 x 8, $25 to $26; 2 x 10, $27; 2 x 12, $28. The hardwood market at Boston is improving and the demand is better than it has been for some months. Prices are firm. One-inch 1st and 2nd maple is bringing $41 to $44, and basswood of the same grade is firm at $44 to $45. Stocks of really dry basswood are scarce and higher prices are expected in the near future. There is a good demand for 1-in. 1st and 2nd red birch at $56 to $59 and sap birch at $45 to $47. The trade in hemlock at Boston is good and prices are firm. Stock lengths of eastern clipped boards are selling at $22 to $23. Shingles are quiet at Boston. The best white cedar extras are bringing up to $3.60; clears $3 to $3.10 and 2nd clears $2.30 to $2.40. Lath continue firm, although the demand is only moderate. For 1½-inch lath the lowest price now is $4, and for 1⅝-in. most sellers are asking $4.25.

Great Britain

There has been a moderate reduction in the demand for lumber at London recently, but spot values continue to show increases as shippers' quotations c.i.f. are still on a steady up grade. Importers of deals and battens from South Swedish ports are obtaining £28 10s. c.i.f. for 3 x 9 and 3 x 8 unsorted red wood, £26 for 3 x 7 and 2½ x 7 and £25 10s. for 2 x 6 and 2 x 4. At Foy, Morgan & Company's recent auction sale, 3 x 11 5th Quebec spruce sold at £26 5s. per standard. 3 x 7 unsorted St. John spruce brought £26 10s. St. John red pine 1st, 2nd and 3rd, 3 x 8 and 3 x 6 sold at £26 and 1st, 2nd, 3rd and unsorted red brought £24 5s. A lot of clear silver spruce from Portland, Oregon, was sold at £30 per standard for 1 x 10/12 and £28 for 1 x 7/9.

The volume of business at Liverpool has been rather light. Stocks are depleted and most of the trade in progress is between merchants and country buyers, in small quantities. All goods are firm in price with an upward tendency and there seems to be no likelihood of easier prices, while freights continue at their present high levels. There is practically no c.i.f. business in progress. Spruce c.i.f. prices are firm, merchants asking in the neighborhood of £28 for 3 x 7 and 8 in. and £30 for 3 x 9 in. and £33 for 3 x 11 in. Arrivals are practically nil. There is practically no c.i.f. market for birch at present. The spot market, however, is very firm and the consumptive demand is good, so that values are sure to rise. At Manchester, the price of timber continues to advance rapidly, with apparently no limit. A small cargo of the usual average spruce was sold lately at £29 per standard, and 7 x 3 spruce was offered at £30 per standard ex quay, with other sizes in proportion. Fine stocks at Manchester are becoming very light. Imports of this wood are not likely to arrive until June and prices are therefore expected to go higher.

At Glasgow, the lumber market continues quite active, the demand having improved considerably of late. A few consignment lots of spruce have recently arrived and have been sold at prices much beyond those hitherto obtained. A little contracting is reported on an f.o.b. basis, but buyers continue to object to entering into contracts of this kind while freights continue so uncertain. There is a good demand for first quality Pacific Coast spruce. Stocks are now exhausted and even the lower grades are scarce.

United States

Industrial conditions throughout the United States continue on an active scale, with the general production below the demand. Car shortages and embargoes have become still more serious and vessels for export shipments continue to be lacking. Steel companies report record orders and the leading producer has announced its intention of spending $35,000,000 on a new plant and improvements. The freight embargo situation and the shortage of transportation facilities continue to restrict the movement of lumber. Railroads are adding to their rolling stock as rapidly as possible, but the car shortage is likely to continue for some time. The worst congestion of cars has been in New York and other eastern seaboard points, but an extensive congestion also exists at Seattle, Wash., where 5,000 cars of freight destined for Russia were reported last week. A similar condition, it is understood, exists at Vancouver, B. C.

The export situation shows no change of importance, the chief factor still being the shortage of tonnage. The Pacific Coast is experiencing a very large demand for lumber for shipment to Australia. No less than eighty vessels are listed as having sailed or being under charter to sail from Pacific ports for Australia before September, all loaded with lumber.

In spite of the numerous obstacles in the way of making shipments of lumber there is a steady increase in the consumption in the chief United States cities. Receipts of lumber at Chicago from January 1st to March 11th amounted to 506,667,000 feet compared with 362,832,000 feet during the corresponding period of 1915. Shipments

View of Mills in Sarnia.

BUY THE BEST

Retailers and woodworking establishments who like to get A1 NORWAY and WHITE PINE LUMBER always buy their stocks from us because we can ship them on quick notice. It pays to have the goods, but it pays better to "deliver" them.

We also make a specialty of heavy timbers cut to order any length up to 60 feet from Pine or B. C. Fir.

"Rush Orders Rushed"

Cleveland-Sarnia Sawmills Co., Limited

SARNIA, ONTARIO

B. P. Bole, Pres. F. H. Goff, Vice-Pres. E. C. Barre, Gen. Mgr. W. A. Saurwein, Ass't. Mgr.

from Chicago during the same period amounted to 230,241,000 feet as compared with 194,898,000 feet during the corresponding period of 1915. The yellow pine situation is quite encouraging with extensive shipments and orders on the books of all mills, although much greater shipments would be made if cars were available.

Northern pine at Chicago continues strong. There is good demand for all yard stock requirements and there is a fair movement of lower grades for box purposes. At Buffalo, the white pine trade shows a little improvement, although the unpleasant weather has been holding back orders to some extent. Prices are firm. At North Tonawanda, there is a good movement of cutting up stock and improvement is reported in common stock. Enquiries and orders are becoming more numerous. Prices have been advancing on a few items, stocks of which are short.

Market Correspondence

SPECIAL REPORTS ON CONDITIONS AT HOME AND ABROAD

Montreal Trade Still Quiet

Montreal, March 24th; (Special to the Canada Lumberman):—So far as local trade is concerned, the market is dull, due to the inactivity in the building business. The unusually severe weather conditions, for this time of the year, have handicapped operations, which are not expected to be on an extensive scale this season. Orders from the United States are moderate. This section of the market is, however, the brightest spot in the general situation. It is reported that there is shortage of cars at some provincial points, making it difficult to ship lumber from the mills.

So far only three Montreal firms have received orders for additional shell boxes, as the result of the tenders which were recently submitted. These are for the smaller boxes, and the prices are understood to be low—so low, in fact, that offers by the Commission to other local firms on the same basis have been refused. The Commission have called for fresh bids on some of the larger sizes, and have, it is stated, changed the specifications with a view of obtaining cheaper boxes. These tenders were to be in Ottawa by the 25th inst.

With regards to exports, the position is still one of doubt, particularly with reference to the tonnage which will be available. From present indications there will be a shortage on the liners. A small amount of additional space has been booked at rates round about three hundred shillings.

The demand for sulphite pulp is exceptionally good, a condition which is likely to continue for some time. Prices have again risen, with a likelihood of still further advances. Canadian mills can readily sell all the pulp available, and practically every mill has orders for a long time ahead. It is a considerable period since there was such a buoyant market, every ton of pulp being shipped out as soon as manufactured. The Riordon Pulp and Paper Company has recently exported some pulp to England. Ground wood is in fair request. Newsprint continues to be in brisk demand for foreign and home account.

St. John Deal Stocks Cleaned Up

St. John, N.B., March 21st; (Special to the Canada Lumberman): Within the next two weeks, the mills at St. John will begin to turn their wheels and get under way for the season of 1916. Just what the coming season will bring forth is hard to say. Under ordinary conditions the manufacturers can look ahead and see pretty clearly what is at the other end. This season he is very much in the dark, and cannot tell just what the future has in store for him. Price is not the greatest question, but how the manufacturer is going to get clear of his stock after he saws it. Tonnage is simply out of the question and the only shipments are those being made by the Admiralty, who are finding all the bottoms, and as every vessel is under the absolute control of the Government they are really the only ones who can do any positive shipping. About all shipments from this port are being made for account of the Government, and have been fairly heavy. Should the present rate of shipments keep up, no doubt a good portion of the sawn stocks for 1916 will be moved. If it should slow up it will mean stagnation for the mills. British buyers do not seem disposed to make any very extended purchases at the moment, so it is really hard to tell just what price can be had for deals. Probably $19 would be a high price at the present time, for an English specification fifty per cent. 9 in. and up, with the strips and fourths at reduced prices, viz., about $2.50 per thousand less.

Stocks of deals will be well cleaned up at St. John when the spring opens, and mills will have a start with clear wharves, which, as explained above, will no doubt be needed.

Spruce boards are out of the question and cannot be had at any low prices unless of a very inferior grade, and then one has to go outside for some distance to find any. It is to be hoped that the spruce board market will not follow last year's market, which was a very dead one. Price was no question. It was find a buyer. At the present moment any person having boards can ask and find buyers at about $17 to $18 for good merchantable stock.

The only stocks of American sizes are held by Stetson, Cutler & Company, who are shipping considerable to the English market, as they have a very long and broad average stock from long and large logs cut in Maine. Very extreme prices are being paid for special orders cut from these logs. The American market remains firm, but no orders are being placed here, as it is useless, as deliveries cannot be made to B. & M. or N. Y., N. H. & H. points, embargos having been placed on these lines for some time. Just when the embargoes will be taken off seems pure guessing. 2 x 3 in., 2 x 6 in., and 2 x 7 in. are quoted at $21, 2 x 4 in., $22.50, 2 x 8 in., $25, 2 x 10 in., $26.50 Boston, but no sales from St. John are being made. Some shipments are being made to New York at private prices, all cargo lots. Freights coastwise are like oceanwise, having advanced to $5 per thousand for New York within the past ten days, with seemingly no let up. Ocean freights are the much discussed question. Three hundred shillings per standard has been paid, and whether it will end there remains to be seen. This price means roughly $36 per thousand feet and seems to the seller like a fairy tale.

The outlook for driving is very good all over the province of New Brunswick and Quebec. At the headwaters of the St. John over Quebec and Maine, 4½ feet of snow covers everything, and sometimes four inches of crust is mixed through it. This coming late, as it has, will no doubt be well preserved, as it is now nearing the breaking up time. Therefore, with warm weather and rains, good water should prevail and be well upheld. Jobbers all over the country have had a good winter, but logging expenses have been somewhat higher owing to increase in the prices of all feeds used in camps, both for men and beasts. Wages were about the same as a year ago.

The quantity of logs to come down the St. John River has been well discussed before and will be about the same as in 1915. It is expected that a very large drift drive of logs will take place in 1916, as many old logs remain in the river from last year, and will no doubt come out with the ice, unless the booms at Fredericton can be closed before they get past. Then they must come on to St. John and be picked up in the lower reaches of the river.

The cut of cedar on the St. John this winter is practically nothing. Shingles being low in price during the last season or two caused operators to retrench in their cutting.

The shingle market remains sluggish, but with a small cut here the west market will no doubt care for them all and will help outside points in the east to get better prices.

London Market Report

Churchill & Sim, London, Eng., in their monthly wood circular, say:—A further decrease in the aggregate delivery of wood in the Port of London of some 4,500 standards is shown during February. There has been no great shortage in the supplies to hand from Sweden and Norway, but the Russian and Canadian figures marked a large falling off in January, and materially affected the overside returns. The demand for piled stock shows no sign of diminution, but is still strong and active for what little is available for immediate use. Prices have again improved all round, especially for floorings and matchings, which are none too plentiful and exhibit the greatest increases in the February values. Forward business has been much hampered by the difficulty and dearness of tonnage, and the earlier chartering rates from both Sweden and the White Sea have proved very advantageous bargains as compared with recent fixtures. There is, apparently, no limit to freight values, which are still the key of the situation, and give buyers a great deal of anxiety when arranging for their open water supplies.

From the St. Lawrence there was imported during February:—

Pine Deals, 2,000 pieces against nil pieces in 1915; Spruce Deals, 3,000 pieces against nil pieces in 1915.

And from New Brunswick, etc.—Pine Deals, 1,000 pieces against nil pieces in 1915; Spruce Deals, 70,000 pieces against 415,000 pieces in 1915; Birch Planks, 17,000 pieces against 1,000 pieces in 1915.

The market for Pine deals has been stronger again, especially in

Established 1894 ***Incorporated 1908***

Campbellton, New Brunswick

the lower qualities, but the prices for 1sts and 2nds have not been influenced to any great extent, having attained their present levels more by reason of their scarcity than on account of any improved demand for them. The importation of Spruce from the lower ports on a very greatly reduced scale. barely one-sixth of the quantities having come to hand so far this year as compared with the 1915 figures. The result is a constantly increasing market value all over the country, which is in no way fictitious, but is again a consequence of the scarcity and dearness of tonnage.

There has been some demand for Birch planks and quotations have risen sharply when the prices at which stock could be replaced were realised.

Liverpool and Manchester Stocks

The following report upon Liverpool and Manchester stocks for the month ending February 29th, 1916, is furnished by H. W. Lightburne & Company, Liverpool, and their St. John, N.B., representatives John E. Moore & Company, Limited.

Barbados Market Report

S. P. Musson, Son & Co., Barbados, report under date of 2nd March, as follows:—Lumberstuffs—White Pine—The position is unchanged since last advised. No receipts are to hand. Supplies are wanted and first arrivals should sell well. We should say that $35.50 and $36 for merchantable, and $27 and $28 for second quality, would be obtainable for first receipts. Spruce—Market is lightly supplied but shipments are said to be on the way. Shingles—Selected Long Gaspe are wanted, and we could recommend shipments, but cedar laying are in heavy stock, with no demand. Shooks—The Schooner "Ellen Little" from Portland has arrived with a cargo of 15,080 bdls. which is going into store; also 672 bdls. barrel shooks. The S.S. "Cratheus" from Mobile has also brought 946 bbls. of these latter. Wood hoops—We note the arrival of 500 bundles by London steamers for dealers account.

Furniture and Piano Trades Improving

Montreal, March 24, (Special to The Canada Lumberman):—Mr. George Kersley, wholesale lumber and veneer merchant, Montreal, recently returned from a month's successful visit to the principal piano and furniture centres in Ontario. He reports that business, particularly in the former branch of industry has revived in a marked degree. Some furniture manufacturers are also in a much better position, so far as orders are concerned, than they were a few months ago.

News Print and Sulphite Pulp in India

Mr. H. R. MacMillan, Special Trade Commissioner, writes the Department of Trade & Commerce, Ottawa, to the effect that a demand exists in India for newsprint paper and bleached or unbleached sulphite pulp. The newsprint paper now used in India is all imported from Europe. Although the demand is small because of the limited circulation of the newspapers, prices rose in January to $116 per ton c.i.f. Calcutta.

Sulphite pulp is imported from Scandinavia to be used in mixture with the locally made grass and bamboo pulps for the manufacture of the finer grades of printing paper. About 20,000 tons a year are imported. The price ordinarily is £9 to £10 per ton c.i.f. Calcutta, but prices have now mounted to £17 10s. for unbleached pulp. The cost of bleaching pulp in India is about 30s. per ton. If bleached pulp could be delivered in India by July at £18 to £19 per ton or unbleached at £17, sales could be made for lots of 1,000 to 2,000 tons. It is possible that pulp could be shipped via Hong Kong from Vancouver.

The names and addresses of the principal Indian importers of newsprint and sulphite pulp may be obtained from the Department of Trade and Commerce (refer File No. A-1499).

Advertising—Preparing the Copy

By R. P. Roedell

Advertising has been called an art. Today it is a buisness. It has sprung up out of the needs of the present day methods of transacting business in all lines, and brainy men of the country have recognized in it a profession in which they might well justify close application to details, careful thought and study regarding plans and methods, and the propriety of scientifically reaching the buying public through the medium of the newspaper, the magazine, the street car and the billboards, as well as a direct letter or card.

An advertisement is merely an open letter to the public, and is either direct or indirect; in the first instance, appealing directly and specially to certain of those whose patronage you have or may desire, the latter a campaign of publicity, generalizing your efforts and seeking to expand by virtue of all legitimate means. In the stress of the daily business life, of necessity the first thing which should require one's attention is system. Without system, one is carried along by the swirling waters of uncertainty and doubt. of hesitation and mistake, and finally lands in the depths of failure. You who have charge of a business must realize that, in the great scheme of successfully conducting that business, there must be various departments. The surest and safest way to departmentalize your business properly is to classify your desk work, and assign to one department the task of carefully and scientifically advertising your business. You may no longer sit down at your desk, dash off a few lines or a few figures, send them to the newspapers for publication, and expect results. This department requires special care, and it demands of you special thought; it asks of you reasonable attention.

Preparation for Writing an "Ad."

Before we reach the details of writing an "ad," so called, it is proper to ascertain the best way to make preparation therefor. You can not correctly write such a letter as we have indicated without first having at your command all of the essential data relating to your particular business. One of the first things which a business man should do is to prepare a budget of his expense. This he can estimate from his past experiences. A certain volume of business will require a certain amount of expense. If you can increase the volume of business without likewise increasing your expense, you are well along toward results which will be pleasing to you and will demonstrate the real value of an orderly method of transacting those things which come to you day by day. Necessarily it follows that there should be a proper distribution of this expense, and an allotment of a certain amount to the subject of advertising. These figures you should watch not year by year, but month by month, week by week, by comparison, by analysis of conditions, and you will be surprised not only at the results which you will obtain, but at the real efficiency which you are acquiring in this same process.

One of the first steps taken by him who is keen in the matter of analysis. is the gauging of the market in which he expects to dispose of his merchandise.

What territory do you cover? What is the buying power of this territory? What are the possibilities for expansion? These are questions which present themselves in the building of a foundation of thought which will find expression in an advertisement best designed to bring in what it was sent for.

Then, again, there is the matter of organization within your place of business. You may write "ads" to your heart's content, but if you have a lack of organization, there will be a clashing of good effort and poor, which will result only in disaster. Those who surround you in your business must co-operate with you, and you must win their co-operation by careful methods, by just means above all else, by arousing enthusiasm in your business, by displaying your own willingness to be a part of the organization referred to, so that you may occasion within the minds of those about you the exercise of good judgment, the desire to sell more goods, the wish to be of benefit to you.

Try Your Hardest to Profit from Mistakes

This takes you a little farther along in the building of this foundation, and brings you to the thought of preventing mistakes. Mistakes will happen; they can be minimized; they should be overcome; but to a greater or less extent they will in some manner recur, and it is by virtue of our mistakes of the past that we build safely for the future. It enables you to more easily and powerfully control your organization, so that its members, in turn, will realize the necessity of learning

Eastern Sales Offices

Toronto—H. A. Rose, L. D. Barclay Montreal—R. H. Underhill

by errors that have been made in the past, and not merely dismiss them with but a passing thought.

Writing "ads" will be of little avail to you unless you are prepared to back them with service. The good will of your business is such that your part of the transaction is not closed merely by selling. This is an age in which we hear much of service, but how little many of us understand the meaning of this term. Real service to your patrons means the carrying out of your contract with them to the fullest extent, not ending with the mere buying and selling, but with the encouragement of your customer, and, finally, the pleasing of your customer, and making of him one who is thoroughly satisfied with the manner in which you have endeavored to deal with him.

But even here, you may not stop in a consideration of what is necessary to be considered in connection with writing this open letter to all whom you expect to take advantage of what is offered in it. Your foundation is not secure unless you have been able to, by various processes, determine the right selling prices, to know those things which to you are the most profitable, and the most desired by your patrons, to follow daily your profits as well as your expenses, to know when to lower prices and when to boost them.

The Method of Selling

Then, again, there is another important element entering into a consideration of this entire matter, and that is, the method of selling. Sometimes special sales are conducted, and these must be properly prepared for so that you may not only move the goods specially advertised, but that they may go out into the channels which will eventually be the most satisfactory to you as well as to the purchaser. Occasionally, yes often, dead stocks accumulate and it many times requires considerable ingenuity to determine upon the method of selling them. There are times in the year when seasons are dull, when expense is mounting up and sales are running down, and this condition must be met wisely, so that the general average of results will not only remain as good as theretofore, but will be increased as you reach out for business. You should have in mind. also, trade which has been lost to you for one reason or another, sometimes within your understanding and sometimes not, and this must be one consideration in connection with the building of the foundation to which we have referred.

We have now indicated a few thoughts in the preparation of, and things to be done for, your advice to the public as to what you have for sale, and what your desires are. Let us, therefore, for a few moments consider the writing of the letter itself, whether it be direct or indirect. First of all,there must enter into it the element of your personality. It is your business which is being advertised; it is your patrons you hope to reach, and this personal element should be apparent throughout the preparation of the "ad" and its final completion. What is an advertisement but a personal appeal. Ordinarily it is not some stranger who asks the patronage of the one who reads, but it is the prospective patron of yourself to whom the invitation is directed, and, consequently, your ideas, your thoughts, your business should be prominent in this open letter to your friends and patrons; but you must say something which will get your reader's attention. What you say should be based upon a study of those you expect to read your "ad." It must be done in such a way, whether it be something intended for magazine or newspaper, bill-board or street car. which will draw attention, whether it be in language or in objects, whether it be in colors or in ingenuity; even then you may fail, unless beforehand you marshal all your facts so that you may use the best argument in this appeal. You would not think of making a speech to a jury unless you had done this very thing, and were endeavoring to convince the listening jurors of the righteousness of your position and the infallibility of your requirements.

I have referred to the personal element. There is another element which I might call the "I-mean-you" element. I have seen advertisements, to illustrate, with the finger of a man pointing apparently at myself. Let your ideas, let your language, let your thought be such that it will be a direct appeal to him who reads, and thus reach this element which brings results. It is this which creates a desire to buy; it is this which works up to the climax of the reader's wish; it is this which makes him say to himself that you have proven your case; it is this which makes of him a patron and a friend.

The advertisement must not only radiate the elements above referred to, but above all, it must be true. It may be argumentative, convincing, forceful, powerful, snappy, searching, witty, entertaining, appealing, picturesque, but, above all, honest as you would want your employe to be and not deceptive like the Judas protestations of false friends; clear as sunlight, which makes the day beautiful, and not dark like the gloomy hours when murky shadows fall; bright as the shining armor of the Christian pilgrim as he overcomes the Adversary; open as the Book of Life, and not mysterious like the hieroglyphics of an unknown ancient tongue. When you have this element of truth, backed by a real personality, in what you write you have a fitting structure to rear upon the firm foundation to which we have adverted. We read that "murder will out;" so will falsehood. Chicanery never succeeds. Loyalty is one of the choice characteristics of real manhood. It should be applied in your business to those who come and go as the steady stream of cup-bearers bringing to your office daily your portion of the nectar of advancement and profit.

"Let the Purchaser Beware"

One of the legal doctrines which has gained much of a foothold in legal thought and principles, is that known as caveat emptor, "Let the purchaser before." Surely we are rapidly setting aside this rule as applied to advertising for business, and the courts have found out that while, of course, the prospective or proposed purchaser should not be negligent, and should be fully awake in all of his transactions, yet undue advantage should not be taken of him, and the public should be entitled to protection, particularly inasmuch as they are not always in a position to know just where to ascertain what their attitude should be in relation to this ancient rule.

It is today a source of pleasure to realize that proper contemplation of the rights of all is leading us into channels of thought and action whereby society may protect itself against those who seek to make profit out of our innocent trust, when we read the glowing accounts in advertisements which, even if not untrue, are at least grossly exaggerated. We are learning to beware of "The world's greatest aggregation of soul-stirring acts," menageries which contain "Wild beasts from the darkest jungles of darkest Africa," "stupendous, marvelous, unequaled, greatest in the world" hippodromes; also when we read of the nostrum which not only cures every disease ever known to mankind, but if it does not do so, your money will be refunded. We are at once suspicious of the source of this remarkable invitation. Until recently there has been no great attempt to reach this evil. One does not appreciate the height, and breadth, and length of this monstrous wrong until he realizes to what a great extent advertising influences the buying public.

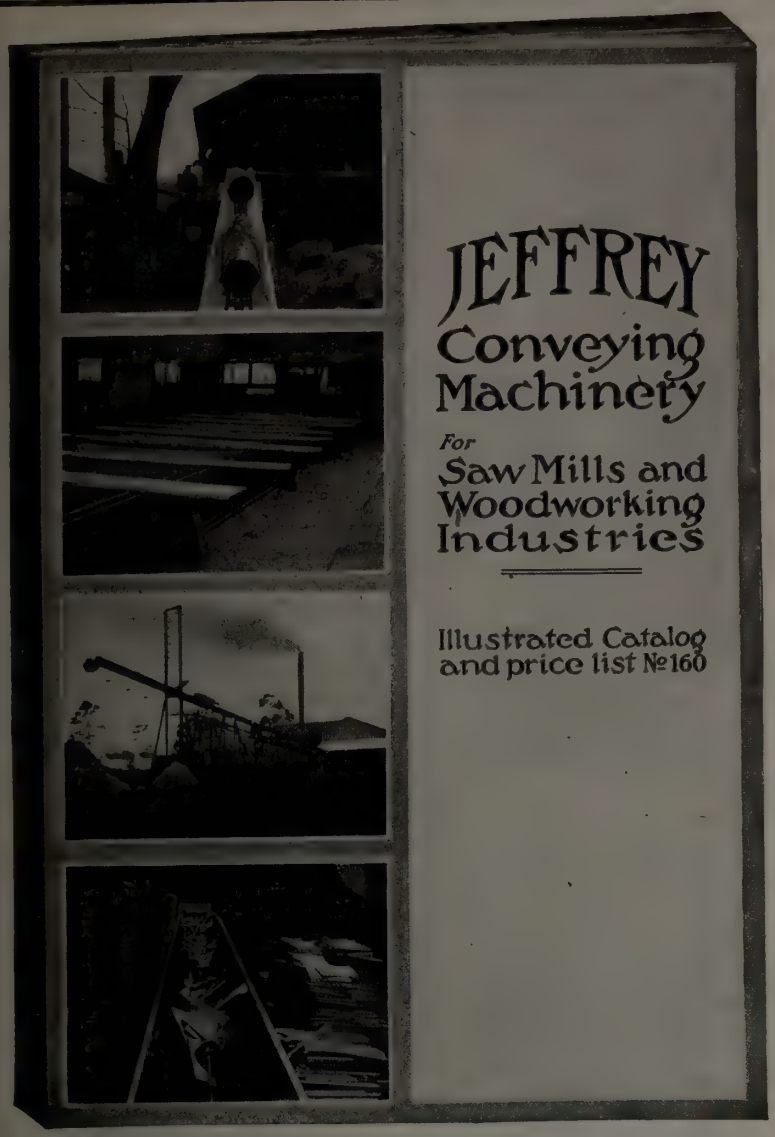
Competition, we hear, is the life of trade. Also, it is largely responsible for the efforts of the seller, scrambling over his neighbor as he often does, to reach the coveted goal first, or to reach out the container into which the shekels of the gullible may fall. So various States have enacted laws upon the subject of misleading advertising. Statutes have been enacted making it unlawful to advertise statements regarding quantity, quality, cost, reason for the price, etc., which have the appearance of deception to the proposed or prospective purchaser. This is a great step in the right direction. Other laws have been enacted seeking to reach untruthful advertising regarding fire sales, bankrupt sales, and the like. These have been prolific sources for unscrupulous people to evolve schemes whereby they might reach into the pockets of a not unwilling, ready-to-be-humbugged public, and have provided the reason for legislation which has been upheld by the courts as not in contravention of the rights and liberties guaranteed to us under the constitution. Laws have been enacted to prohibit certain kinds of advertising regarding liquors, the cure of certain diseases, the procurement of divorces, and the like. This is a free country, but freedom does not imply the right to grind one's fellowman under the heel of lying and unfathomable deception; consequently we are awakening to the need of arising to a courageous stand, justified by past experience and hope for the future. Law cannot make a saint out of a criminal, but it can protect the worthy from the unworthy; it cannot create right, but it can resrain wrong. When morality co-operates with justice, the grabbing crook will find but a small field for his endeavor, and he will gradually eliminate himself from the scheme of all things.

Making Progress Toward High Ideals

This thought brings us, then, to the question of what progress we are making in the particular field suggested by my topic. I believe we are progressing, reaching a higher plane, encouraging a greater degree of honor in the advertiser. Sociology has a place in this discussion. "Individualism" is an element in "Commercialism," as well as "Nationalism." "Made in America" is a national slogan; "Made right" should be the individual announcement; "Made honestly." the advertiser's inspiration from his handiwork.

What is progress? Is it spectacular like the rushing mountain brook, or is it steady like the broad stream? Is it cold like the winter frost, or does it radiate warmth like the zephyrs of a June day? Is it like a peal of thunder, or the steady rumble of increasing energy? Surely it is Truth, ever exemplifying the proper things of life, ever pointing to those things which bring to life the blessings of real accomplishment.

We sometimes wonder how so many of our big men are able to perform apparent impossibilities, and proceed to credit them with some mysterious power, and thereupon wipe out any egotism which may have existed concerning our own capabilities. We then make ourselves believe we have our limitations and are content with mediocre results. But look again and learn the secret—System, Method, Truth—these are the underlying agencies of personality and Power. The whole evolves success.



All Saw Mill Men Agree—

That to be compelled to shut down a part or all of the Mill or Plant and to have long waits for Repair Parts—is very annoying and expensive.

That is why you will appreciate the Service we can render you in supplying your wants quickly from our Montreal Branch, where a complete line of Standard Conveying Chains, Bearings, Hangers, Take-up Boxes, Spiral Conveyer, Malleable and Steel Elevator Buckets, Sprockets and Gears, Transmission Machinery, etc., is carried in stock ready for immediate shipment.

OUR CATALOG AND PRICE-LIST No. 160 has been published solely in order to enable you to know the quality of Jeffrey Equipment and Service, and to quickly select the part needed for your mill. Simply Telegraph, Phone or Write our Montreal Office and you will get it on short notice.

This 144-Page Book, in addition to describing fully the Service Application of our many products for Saw Mills and Woodworking Industries, pictures many interesting installations, and contains valuable engineering data.

The Shoe Peg Business

Shoe pegs are bought and sold by the pint, peck, and bushel, while the narrow ribbons of woods of which the pegs are made are bartered in rolls. It is therefore apparent that the pegs with which soles are fastened on shoes appear on the market in two forms. In one, the pegs are in separate pieces. each shaped and pointed ready for driving. The other form is a ribbon of wood as wide as the peg is long, and thick enough to form the body of the peg. The first form is intended for the use of cobblers and shoe makers who work with hand tools. They punch holes in the shoe with a pegging awl, and drive in the pegs, one at a time, by light taps with a hammer. That was the old style method of making shoes, and it is still followed by the worker in the small shop.

The large factory follows another method. It makes shoes by machinery. Instead of buying pegs each individually complete, as the country cobbler does, it purchases them only partly manufactured in the form of the peg ribbons above described. These ribbons are in rolls and are fed to the machine as thread comes from a spool. The machine points the pegs, slices them off one by one very rapidly, and drives them in the sole, all without human assistance except to keep the machine in working order and well supplied with peg rolls.

The pegs are nearly all of paper birch. That wood possesses properties which cause it to be given preference over all other woods. This is the wood of which most thread spools are made. It is a white color, is hard, strong, and tools are not dulled rapidly in cutting it. The peg material is first cut from the log as rotary veneer in proper thickness for the peg that is to be made. The veneer is then further manufactured, either into ribbons or finished pegs.

Pegs are several sizes, ranging in length from those about one-third of an inch to nearly an inch. The short pegs are for light, thin soles, the long ones for heels and the heaviest soles. Pegs are not used in the manufacture of all kinds of shoes. Fine ones may have none, the soles being sewed on. The largest use is in heavy shoes and boots. The pegged sole makes the shoe stiff and rigid and it is apt to be less comfortable than the sewed sole, on the wearer's foot.

It is not possible to determine exactly how much wood is required annually to furnish the country with shoe pegs. Available statistics include pegs, shanks, and wooden heels all under one head, and these articles call for 7,483,000 feet of paper birch; but it cannot be stated how much of this goes into pegs. In New Hampshire the yearly consumption of wood for pegs totals 2,512,000 feet, of which a little more than one-third is yellow birch, the remainder paper birch.

In some factories shoepegs are split from blocks instead of being cut from veener. The disks are cut the length of the peg, grooves are cut across the end in both directions forming squares the size of the peg, and at the same process each peg is pointed.

Dunlop Originality Recognized

Word has just come from New York, which would indicate that a remarkable compliment has been paid to the Dunlop Tire & Rubber Goods Co., Limited.

A large agency, who keep a portfolio of the world's best advertising matter gathered together from every part of the map—include in that portfolia the Dunlop "Famous Picture" series which appeared in Canadian newspapers last September.

The "Famous Pictures" were the first ads. of the type ever run in America, or any other part of the world so far as can be traced, and that is probably the reason why the agency in question selected the series for their portfolio, as their big endeavor is to get new treatment on any subject or, in other words, originality all along the line.

The British Columbia Government announces that it will raise $2,000,000 to assist a shipbuilding industry which will be established in Victoria, and perhaps in other places. It is thought that the scheme will materialize, since great interest is being taken in the matter on all sides. It is fully realized that unless locally owned ships are available British Columbia will not be able to take advantage of the big trade in lumber which is already beginning to show up in volume. It is probable that the Canadian Puget Sound Lumber Company, Victoria, will take advantage of the offer of a provincial guaranty and start building ships. This concern went into liquidation in May, 1914, but it has been reorganized and is about to resume operations.

A meeting of lumbermen was held at Cranbrook, B. C., recently. Those present were all optimistic about the trade situation and most of them expected that the saw mills of that district would be running by April 1st or sooner. Planing mills in connection with the various plants are all busy.

EDGINGS

Ontario

Wm. Travis, Wyoming, Ont., is contemplating the erection of a planing mill to cost $4,000.

Alderic Charpentier, 141 Main Street, Ottawa, Ont., is erecting a planing mill. The building will be of frame construction.

Nathan Calder, Listowel, Ont., is contemplating the purchase of planing mill equipment which will be operated by Hydro power.

R. A. Y. Stinchcombe, Wharncliffe Road, West London, Ont., is contemplating the purchase of woodworking machinery.

The Riordon Pulp and Paper Company have made arrangements for installing a bleaching plant at their mill at Merritton, Ont. It is expected that it will be in operation about the first of July. The company will then bleach the whole of the sulphite pulp used at this mill.

Berth No. 82 on the White Fish River in Northern Ontario has been bought by Geo. Jackson, of Little Current, from Wm. Charlton. This limit adjoins berth No. 90, in which Mr. Jackson is operating at present. The logs will be brought down to the mill at Little Current, Ont.

The Canadian Hardwoods Limited has been incorporated with head office at Ottawa, Ont., and capital stock of $150,000, to carry on business as timber, lumber and wood merchants, sawmill and planing mill operators and manufacturers of timber and lumber of all kinds. The provisional directors of the company are C. Magee, J. I. MacCraken, E. McMahon, H. E McMahon and L. F. McMurtry, all of Ottawa.

Eastern Canada

J. L. Rainville and Cie, manufacturers of sash and doors, Montreal, P. Q., have been registered.

Savoie & Cie, Manseau, Nicolet County, P. Q., are contemplating the erection of a sawmill this coming season to cost $4,000.

M. Proulx, Durham South, Drummond County, P. Q., is contemplating the erection of a sash and door factory this spring, to cost $2,000.

The sawmill and sash and door factory of Pauze and Gohier, Cote des Neiges Road, Montreal, has been partly destroyed by fire. The damage is $21,000.

E. M. Nicholson & Company, Limited, lumber exporters, Montreal, P.Q., have been registered. Those interested are E. M. Nicholson, J. W. Harding, A. Boulet and J. G. Cowan.

J. A. Theberge Ltd., have been incorporated with capital stock of $20,000 and head office at Quebec, P. Q., to carry on a general lumber business. The incorporators include E. Theberge, R. Chenevert, P. Caumartin, P. Gregory, and A. Tracy.

J. & A. Culligan have purchased the property of the Prescott Lumber Company at Benjamin River, N. B. The transfer includes the mill, timber limits, store, buildings, lumber, etc. Mr. Barbour who has been with the Prescott Lumber Company will be the new manager.

The Auger-Rancourt Lumber Company has been incorporated with head office at Quebec, P. Q., and capital stock of $49,900, to carry on business as manufacturers and wholesale lumber dealers. Those interested are O. Auger, H. Lacoursiere, J. Rancourt, J. Bureau, C. Rodrigue, and G. Pomerleau.

It is reported that the Laurentide Company, Grand'Mere, P.Q., will double its news plant capacity. The present capacity of the company's plant is 400,000 pounds of news print per day and 90,000 pounds of board. The pulp capacity is 460,000 pounds of dry mechanical pulp and 220,000 pounds of sulphite fibre.

The Belgo-Canadian Pulp and Paper Company, Limited, Shawinigan Falls, P. Q., are making a number of additions to their sawmill and planing mill. They do not expect to have the alterations completed until some time late in the season. They are also making a number of additions to the pulp and paper mill, which will not be completed before 1917.

The Acme Steel Goods Company of Canada, Limited, has been incorporated to take over the Canadian business of the Acme Steel Goods Company, Chicago, manufacturers of box strapping and fasteners. Mr. J. E. Beauchamp, who previously represented the Chicago company, is the manager of the Canadian company, with offices at 20 St. Nicholas Street, Montreal.

Western Canada

The Apex Lumber Company, Limited, Vancouver, B. C., has been incorporated with capital stock of $50,000.

Messrs. Seeds and King are taking in machinery for the erection of a sawmill on the west side of the Capilano River, B. C., just north of the Canyon View Hotel.

H. Butterfield, Squamish, B. C., is contemplating the erection of a shingle

mill this spring at an estimated cost of $10,000. Owner will purchase dry kiln equipmnet.

The Retail Lumbermen's Mutual Fire Insurance Company, Limited, has been incorporated in the province of Saskatchewan. The company's head office is at Winnipeg.

L. E. Ross care of Capiland Cedar Company, North Vancouver, B. C., is contemplating the erection of a shingle mill at that place. Plans and details have not yet been completed.

J. B. Sutton, who recently built a shingle mill at Arrowhead, B. C., and subsequently sold it, is purchasing machinery for a new and larger mill which he is erecting at the head of the Trout Lakes.

J. A. Maguire, Calgary, Alta., representing the Asquith Timber Interests, states that a sawmill will be erected immediately, at the head of Hospital Creek, about four miles from Golden, B. C. At the outset Mr. Maguire expects to employ about 35 men.

The Warren Timber Company has been incorporated with head office at Vancouver, B.C., and capital stock of $125,000, to carry on business as manufacturers of and dealers in lumber and shingles, sawmill owners, loggers and lumber and shingle merchants.

The Hudson Bay Zinc Company, Limited, has been incorporated with head office at Salmo, B. C., and capital stock of $5,000,000, to carry on business, among other things, as timber merchants, sawmill, shingle mill and pulp mill owners, loggers, lumbermen, and to manufacture and deal in timber, lumber, shingles, laths, sash, doors, etc.

H. A. Dent and A. W. Milroi, Seattle lumbermen, have purchased the Canadian Pacific lumber mill and 25,000,000 feet of fir and cedar timber at Port Alberni, on Vancouver Island, B. C. The mill, which has been idle for eighteen months, will be operating with 200 men about April 1st. The plant will cut from 100,000 to 150,000 feet of lumber per day and will be kept running to its full capacity.

The D. J. O'Brien Logging Company, Limited, has been incorporated with head office at Vancouver, B. C., and capital stock of $25,000, to carry on business as timber and lumber merchants, loggers, sawmill proprietors, etc., and to take over as a going concern and manage, operate, or otherwise deal with or dispose of the general logging and lumber business now carried on by D. J. O'Brien of Vancouver.

At a recent meeting of the Montreal Chambre de Commerce, it was pointed out that the Forests Products Laboratories were anxious to help lumbermen in the matter of information as to the uses of particular woods. If, therefore, any member of the Chambre received inquiries from abroad, it was a wrong policy to reply that a certain kind of wood was not obtainable in Canada. A member should inquire the purpose for which the wood was required, and with the assistance of the laboratories would be able to show what Canadian wood would meet the requirements of the parties making inquiries.

J. C. Manzer, commercial representative in Cuba for the province of New Brunswick, in a personal letter to a friend in Vancouver, expresses the opinion that the Government of British Columbia should do all it can toward establishing a line of ships between British Columbia and Cuba. He says there should be a good opening in Cuba for Douglas fir and spruce, which, according to dealers, would serve the best purpose and command the same price as southern yellow pine. At present high freight rates militate against successful trade.

The Julius Seidel Lumber Company, St. Louis, Mo., have sent out an attractive calendar for 1916, to their friends in the trade. Each month is given a separate sheet on the calendar and each sheet contains in addition to the calendar for the month a splendid half-tone reproduction showing scenes in the yard and plant of the company. An attractive colored background is used in connection with each of the calendar sheets, some showing scenes in the forest and others showing samples of finished woods.

At a meeting of the Mountain Lumber Manufacturers' Association in Calgary recently, a resolution was adopted that all members of the Association contribute fifty per cent. of their net profits to the Federal Government for patriotic purposes. Another resolution recommended to the members that every lumber manufacturer collect one dollar per head each month from each unmarried employee for patriotic purposes, unmarried employes not consenting to this arrangement to be dismissed.

At the 6th annual meeting of the Edgewood Lumber Co. Ltd., Nelson, B. C., the following officers were elected:—Wm. Waldie, president and managing director, John E. Taylor, secretary-treasurer, P. H. Dubar, auditor. Mr. Waldie reported plenty of orders on hand and excellent prospects for a busy season.

Chisel Tooth Saws

The Choice of Lumbermen in two Hemispheres

More than 80,000 of these saws are now in use in all parts of the world. Hoe Chisel Tooth Saws are backed by 86 years' experience in the manufacture of saws. They are made from the finest steel, evenly tempered throughout. Special Flanged Shanks and Superior Bits are supplied for sawing hardwood.

We are the oldest Saw manufacturers in America

R. HOE & CO. 504-520 Grand Street, **NEW YORK CITY**

TURN YOUR REFUSE INTO FUEL

The disposal of waste in a saw, planing or pulp mill used to be an item of expense. By the installation of Jones Underfeed Stokers this waste can be used as fuel. The use of the Stoker equipment consumes as illustrated, the refuse and by the mixture of a small amount of coal a steady steam pressure is maintained. If you should run out of refuse or the mill conveyers break down, the change to coal fuel can be made instantaneously without any fluctuation of the steam gauge. One large pulp and paper mill reduced its coal bill 99 o/o with Jones Underfeed Stokers and the utilization of its mill refuse. Every mill cannot make such a colossal saving as this but substantial economy can always be effected with Jones Stokers.

What are the conditions in your mill? Let us talk to you.

Arrangement of Jones Underfeed Stokers in Dutch Oven for burning paper mill refuse in conjunction with coal.

JONES UNDERFEED STOKER CO., LIMITED

National Trust Building, TORONTO

Dominion Timber Regulations

Licenses to cut timber on Dominion Lands in the Provinces of Manitoba, Saskatchewan, and Alberta, the Northwest Territories, within twenty miles on either side of the main line of the Canadian Pacific Railway in the Province of British Columbia, and in the tract of three and one-half million acres to be located by the Government in the Dominion in the Peace River district in the Province of British Columbia, lying east of the Rocky Mountains and adjoining the Province of Alberta, shall be disposed of by public auction at the office of the Dominion Timber Agent for the districts in which the berths are situated.

Before any parcel of timber is offered for sale it shall be surveyed by a duly qualified Dominion Land Surveyor into berths of an area not exceeding twenty-five square miles, and each of such berths shall then be thoroughly cruised by a duly qualified timber cruiser in the employ of the Dominion Government. The Minister shall then fix an upset price at which the berth shall be disposed of, and no berth shall be sold at less than the price so fixed.

Purchases to the amount of one thousand dollars or under shall be paid in cash at the time of sale. Purchases over one thousand dollars and not exceeding five thousand dollars shall be paid, one-half in cash at the time of sale, and a note or notes shall be given for the remaining half of the purchase price, payable in three months, with interest at the rate of five per cent. per annum. Purchases over five thousand dollars and not exceeding ten thousand dollars shall be paid one-third in cash at the time of sale, and notes shall be given for the remaining two-thirds of the purchase price, payable in three and six months, with interest at the rate of five per cent. per annum. Purchases exceeding ten thousand dollars shall be paid one-fourth in cash at time of sale, and notes shall be given for the remaining three-fourths of the purchase price, payable within three, six and nine months, with interest at the rate of five per cent. per annum. Notes shall be made payable at a bank in the city or town in which the sale is held or at a bank in the city of Ottawa. Cash payments must be made at the time of sale in legal tender or by an accepted cheque on a chartered bank, or by a draft issued by a chartered bank, payable to the order of the Deputy Minister of the Interior. If default is made in any payment required by this section the sale shall be forfeited and void.

The purchaser must also pay the cost or the estimated cost of the survey of the berth before a license is issued.

The licensee shall pay an annual ground rent of five dollars per square mile except for lands situated to the west of Yale, in the Province of British Columbia, in which case the yearly ground rent shall be five cents per acre.

The licensee shall pay the following dues on timber cut on his berth :—

Sawn lumber, 50 cents per thousand feet, board measure.

Railway ties, eight feet long, 1½ cents each.

Railway ties, nine feet long, 1¾ cents each.

Shingle bolts, 25 cents per cord.

And 5 per cent. on the sale of all other products of the berth.

Timber Permits

Yearly permits are granted to settlers, mine operators and others on application to the Dominion Timber Agents, from whom further information can be obtained.

W. W. Cory,

Department of the Interior, Ottawa, Deputy Minister.
December 20th, 1912.

FREE!
TO LUMBERMEN
Sample of Egyptian Liniment

We know that when you have once used our Egyptian Liniment on your horses you will always keep it on hand; that is why we offer free samples to lumbermen. Just write and ask for your sample. Its greatest use is to stop bleeding immediately. It is also excellent in cases of toothache, sore throat, neuralgia, rheumatism, etc., it effects immediate relief. In the stable its use is invaluable for thrush, cuts, spavins, calluses, etc.

Send at once for your free sample.

Garlock Packings

Are made in over two hundred styles and combinations to meet every known requirement. We will assume entire responsibility in selecting the proper styles and combinations of our packings to work successfully and economically under any stated condition; and if goods are not wholly satisfactory to purchaser we will refund promptly the cost of same. A card will bring our new catalog which fully describes our various styles of packings.

Are your horses of use to you?

This seems an absurd question—and the answer is always **"Of course they are"**—In which case provide your stables with:

Johnson's Reliable Veterinary Remedies

Johnson's Horse Liniment, No. 1 (Alcoholic)
1 gal. jugs (Imperial) $4.50 gal.
1 lb. bottles 8.00 doz.
2 lb. bottles 15.00 doz.

Johnson's Horse Liniment, No. 2 (an oil liniment)
1 gal. jugs (Imperial) 3.00 gal.
1 lb. bottles 6.00 doz.
2 lb. bottles 11.00 doz.

Johnson's Horse Colic Remedy
A sure and speedy cure for all kinds of Colic
1 gal. jugs (Imperial) 40 doses 5.00 gal.
1 lb. bottles 4 doses 8.00 doz.
2 lb. bottles 8 doses 15.00 doz,

Johnson's Veterinary Healing Ointment (Gall Cure)
2 lb. tins 2.00 per tin
4 oz. tins 3.50 doz.

Johnson's Condition Powders (Concentrated)
1 lb. Packages 3.60 per doz.

Johnson's Camp and Household Remedies, such as Cough Syrup, Healing Ointment, Headache Powders, Big 4 Liniment, Stomach Bitters, Cathartic Pills, etc., etc., have stood the test of twenty-five years and are in use all over Canada, from the Atlantic to the Pacific. Prices are lower than those of all other manufacturers. Letter orders receive prompt attention.

A. H. Johnson, Wholesale Druggist, **Collingwood, Ont.**

Increase Your Selling Efficiency

THE efficiency of your selling organization can be substantially increased by a closer knowledge of constructional work proposed, or in progress.

The "Contracts Department" of the Contract Record & Engineering Review gives you this information every week in concrete form, while the "Tender" ads published in this paper frequently call for bids on lumber, timber and interior finish. The news and editorial columns report progress on all building and engineering work. Descriptions of all important work are accompanied by illustrations.

Manufacturers of structural timbers, lumber, shingles, doors, flooring and interior finish desiring to interest architects or engineers, or to sell direct to contractors, should reach them through the advertising columns of the Contract Record & Engineering Review.

Subscription price $2.00 a year.

Wilson Bros., Limited - Collingwood, Ont.

GOODHUE BELTING

FACTORY TO YOUR MILL

TO the saw mill and woodworking industries we offer an unusually good belting value in our "Acme Waterproof." This belting is specially made from the best hides to run in wet places where only the best quality belt can "make good." If you require any belting you should enquire into the merits of "Goodhue Belts" then you will buy a "Goodhue." According to the conditions under which the belt has to run we recommend "Extra," "Standard" or "Acme Waterproof"—each brand the best quality but each made for a different service.

Send for particulars and prices **J. L. GOODHUE CO., LIMITED, Danville, Quebec**

LEVIATHAN OR ANACONDA

LEVIATHAN and ANACONDA have been sold on a "make good" basis for over thirty years. If they hadn't made good we would have been out of business long ago. The fact that our business is progressing rapidly is ample proof of the merit of this belting.

With every belt we guarantee full value in service, dollar for dollar, horsepower for horsepower, and just as we have figured our tables of horsepower for the best results, just so in making the above statement, we not only expect to give equal service, but BETTER SERVICE, AND MORE ECONOMICALLY.

A Leviathan Main Drive in constant service for four years at the plant of the Riviere du Loup Pulp Co.—24 in x 6 ply. No cost of up-keep; the belt has never been touched since the day it was installed.

Why not give us a trial order and let LEVIATHAN or ANACONDA prove itself?

The Clark Twin Engine Feed for Sawmill Carriages

BUILT WITH THE FOLLOWING SIZE CYLINDERS:

Dia.	Stroke	Weight
10″	14″	5100 lbs.
12″	16″	7100 lbs.
14″	18″	11700 lbs.
16″	20″	12700 lbs.

The cylinders and frame are cast in one piece. The cross-heads are cast steel with adj. shoes. Valve chests are lined with removable bushings. If you want perfect control of your carriage when feeding slow or if you are sawing long logs you should use this type of feed. It also uses 50 per cent. less steam than the direct shot gun type of feed.

(Continued on page 70

A SPARTAN is the first belt to operate successfully what is considered the hardest quarter-turn drive in the State of Washington. It is a high-speed drive with only five feet between pulley centres. The belt makes two quarter turns and is called upon to drive the entire planing mill. Previous belts slipped, burned, and soon played out. Spartan has already outlasted any former belt, it runs perfectly true, does not slip, and is still in excellent condition.

SPARTAN LEATHER BELTING

because of its strength, pliability and pulley grip is particularly adapted to the most difficult drives in your plant. Spartan-equipped drives insure greater production and less cost for operation.

Gentlemen:

In reply to your query of recent date regarding service rendered by the 14" Spartan Double Belt you installed on our quarter turn drive, we wish to say the belt has been entirely satisfactory, and owing to its extreme pliability and friction we feel we have at last secured the right kind of belt for this particular drive.

Yours truly,

DONOVAN LUMBER COMPANY.

Logging Locomotives
Made in Canada

Our fifty years' experience in the design and manufacture of logging locomotives is at your disposal. Many of the largest logging operators in Canada are using our "Canadian Made" locomotives.

Our logging models are as carefully designed and built as our 200 ton sizes—oil or coal burning.

MAY WE SEND YOU SPECIFICATIONS?

This engine is 13½ ins. x 18 ins. and weighs 35 tons.

LOGGING LOCOMOTIVES

The designs of our Logging locomotives are the result of wide experience, extending over a period of 80 years.

The material used in their construction is thoroughly tested and is the best of its kind.

All details are accurately finished to standard gauges and are absolutely interchangeable on all locomotives of the same class and size.

This cuts out long delays at critical times of the work, as parts liable to wear can be kept on hand or shipped promptly from our works.

ATKINS

There is a distinct advantage in using **Atkins Segment Ground Cross Cut Saws.**

You will realize this fact when you try them.

By actual test we are cutting 25 per cent. more timber with least cost for refitting. Let us send you our book "C.L." Write for it to-day. ATKINS PERFECTION No. 5 and No. 69 EUREKA FALLING SAWS are the most popular Saws in Canada to-day. Send us your name for further information. Let us tell you what these Saws are doing. Then you can use your own good judgment later on.

Atkins No. 69 Eureka Falling

Makers of Sterling Saws

Factory—
HAMILTON, ONT.

Branch House:
109 Powell St.
Vancouver B. C.

A Test In Your Workshop

will convince you of this fact:

That it is cheaper to use two files where you now use only one.

Take a certain piece of work and give one man a new file, and another a half worn file on a similar piece of work.

The man with the new file is doing what you are paying him for. The other man is filing away your time.

The man with the new file takes a pride in his work.

The man with the old file starts with a grouch, and the work suffers.

When the inefficient point in the files is reached it is good policy for you to have your men discard them.

And they should be replaced with the five famous brands:

KEARNEY & FOOT
GREAT WESTERN
AMERICAN
ARCADE
GLOBE
(Made In Canada)

Made in Canada by a plant controlling 90% of the file business.

Backed by 50 years' experience in the making of efficient files.

FIRE BRICK

Differs in Quality and Variety

For instance, a certain quality or kind of brick that gives satisfaction when used in a Refuse Burner, may show up poorly if used in a Dutch Oven.

It all depends on getting the right kind and the right quality for your particular needs.

Just tell us what you want it for, and we'll send a fire-brick that was made for that very purpose.

We Manufacture the Following Well Known Brands

"Elko," "Elk Steel," "St Marys," "Keystone" and "Rotex"

32-Inch Edger

Among the details of this sturdy high capacity edger we may mention:—

The two main frames supporting the bearings are built so as to be stiff and rigid, and are well braced with cast iron tie-plates. It is designed for portable or small stationary saw mills. By a slight change this machine can be made right or left hand to suit mill.

The arbor is 2½ inches in diameter, and made of the best machine steel. The drive pulley is 10 inches in diameter and 8½ inches face.

The arbor runs in three bearings, 6 inches long, all of which are lined with the best babbitt, and fitted with covered oil-cups of ample capacity.

There is one fluted feed roll 5 inches in diameter on either side of saws. These are power driven by means of belt and gears. There is a roll on top, in centre of machine, over which lumber can be passed back.

Saws used are 16 inches in diameter and will cut stock 5 inches thick. Machine is fitted with collars for two saws, one stationary and one movable.

The saw shifter casting has a long bearing on the sliding rod, which makes it shift easy. There is a lever jaw casting supplied to connect to saw shifter.

When overhauling your mill ask us about repair parts or new equipment.

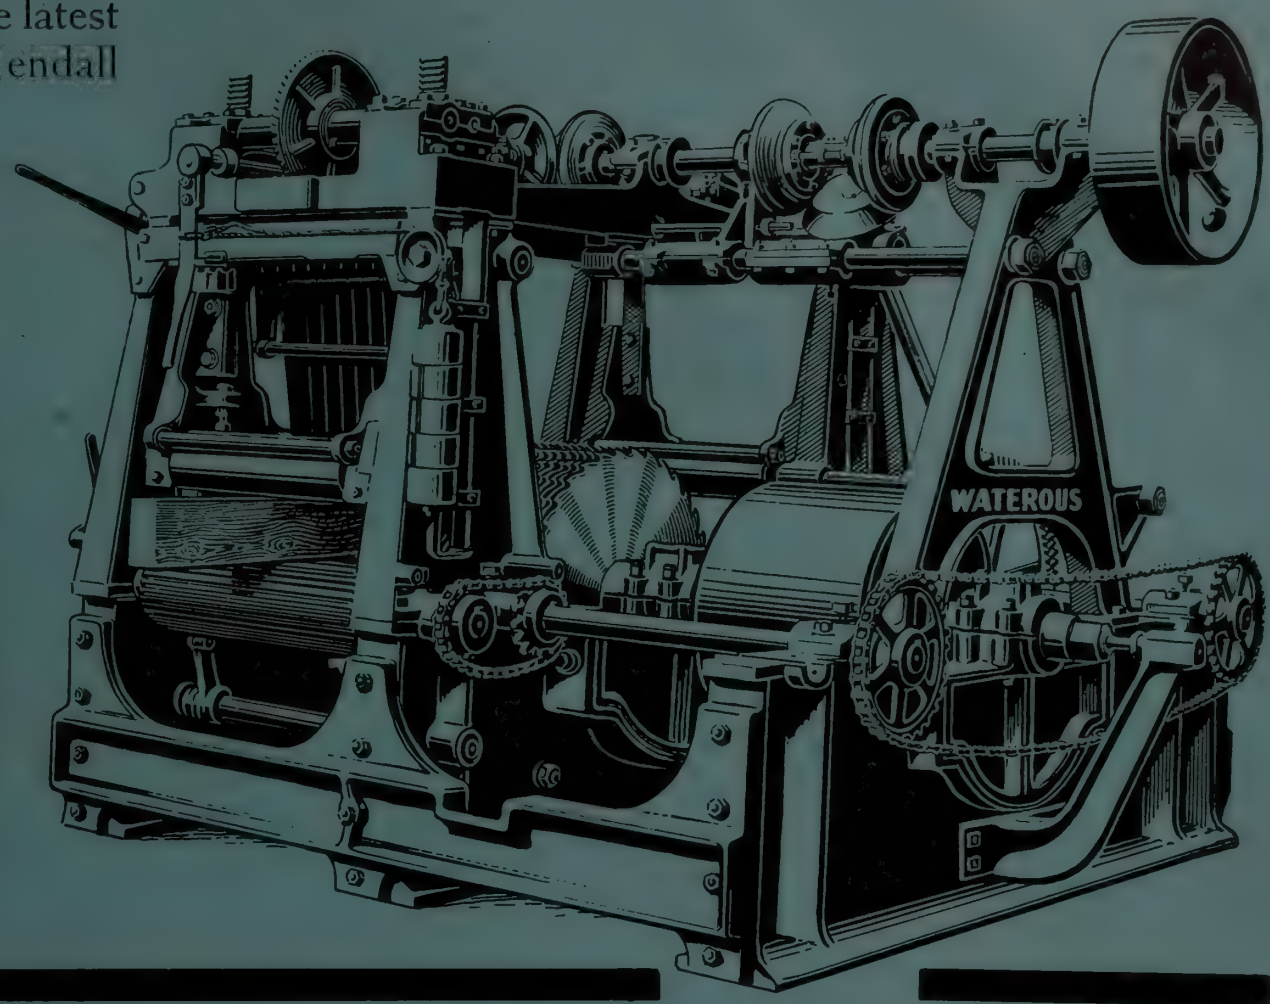
A New Machine That IS New

This illustration shows the latest development of the Kendall Circular Gang.

It was completed in our shops on October 1st, 1915, and is the last word in Circular Gang design.

It takes cants from 4" to 12" thickness and at the rate of from 2500 to 3000 a day, will turn them into lumber, perfect in finish and cut evenly from end to end. Big capacity on small stuff and lumber cut better than is possible on Band Saw, Circular Saw or Vertical Gang distinguish this machine.



The 1916 Model Kendall Circular Gang

The Kendall Circular Gang has come to stay. It meets the demand for a machine that will turn small logs into merchantable lumber economically. Those already in use though of old design have proven its worth.

These earlier models are still being built and sold. They are good machines—***but there is a better.***

The 1916 Model Kendall Gang built under the supervision of Mr. I. N. Kendall, from new drawings, and new patterns, incorporates ***absolutely original features*** found in none of the older design machines now being manufactured elsewhere.

While all the good points of previous models are retained, such weaknesses that use has made apparent have been eliminated. The new features and better construction of this 1916 Kendall Gang mean an appreciable increase in capacity, in nice cutting ability, and in safety, convenience and sturdiness.

This ***latest*** development of the Kendall Gang patents is built in a shop that has specialized in high class machinery construction — that has built machinery for Canadian sawmills for more than 50 years. Our reputation is a guarantee that this New Model Kendall Gang is built as it should be.

When you investigate the Circular Gang question see that you get facts and figures of the "WATEROUS BUILT" Kendall Gang—the new machine that IS new.

The Waterous Engine Works Co., Limited

$5,000,000.00
worth of mixed metal sold annually.

"FROST KING" METAL

Our thirty-five years experience in metal mixing enables us to place on the market a babbitt that we believe to be absolutely perfect. For high speed machinery and engine work it is without an equal. It is specially designed for saw-mills, planing mills, threshing engines, traction engines, pumps, rolling mills, pulp machinery, and all classes of stationary engines. It is a high grade metal made of the very best selected stock, and carefully compounded.

If your dealer does not stock FROST KING send us a money order for your requirements. **Price 30c per lb.**, Fort William and East; West of Fort William **35c per lb.**, delivered nearest railway station; packed in 30 lb. and 60 lb. boxes.

For extra duty, such as over-hanging saws, our FAULTLESS BABBITT will stand where all other metals will fail. Price, Fort William and East, **40c per lb.**; West of Fort William, **45c**, delivered to your nearest railway station; packed in 30 lb. and 60 lb. boxes.

COSTS LESS PER DAY

AMPHIBIA BELTING

COSTS LESS PER DAY

Put Good Belting

on your

Good Machines

Your machines are expensive, and naturally you expect them to turn out the quality and quantity of work commensurate with their cost.

Then why harness them with belting which cannot begin to do them justice?

Use

"AMPHIBIA"

Planer Belting

and get the most work from your machines, in the quickest time, at the lowest cost per day of service.

Try a sample run of "AMPHIBIA" Planer and prove its merits.

"Leather like gold has no substitute."

FOR SALE: Machinery and Timber

The undersigned offer for sale, in large or small blocks all their remaining timber lands, mills and town property situated in the town of Parry Sound, Ont.

We have sold quite a number of timber parcels but still have some good bargains left in Townships of McDougall, Foley, McKellar, Monteith, Carling, Christie, Shawanaga, Burpee, McConkey, Mills, Allen, Secord, Falconbridge and Street.

Special bargains in the townships of Burpee, Falconbridge and Street for small mills.

We have the following Sawmill Machinery for sale:

1 8 ft. Double-cutting Telescope Band Mill, made by Waterous Engine Works.

1 3-block right hand steam feed carriage fitted with steam set works, made by Wm. Hamilton, Peterboro, with 10-in. steam feed cylinder.

1 Double cylinder steam nigger, right hand.

1 Log Loader for right hand mill.

1 8 ft. Double-cutting Telescope Band Mill, made by Waterous Engine Works.

1 10 in. Double-cylinder steam feed carriage, left hand, for cutting 24-ft. logs.

1 left-hand steam nigger.

1 Log-loader.

1 Endless chain jack ladder with two kickers complete for right and left hand mills.

2 Roger Gang Edgers for 8-in. cants and lumber.

1 Waterous double edger, 6 saws.

2 2-saw trimmers.

1 20-ft. Slash table.

1 16-ft. Revolving Slash Table.

1 Horizontal Slab Resaw with 5-ft. wheels, made by Diamond Iron Works.

1 70-ft. Transfer Chain for sorting lumber, with necessary levers, rolls and transfer chains to complete outfit.

1 Lath Mill with bolter.

2 Lath Trimming Saws.

FILING ROOM

1 Automatic Filing Machine for 12-in. D.C. band saws.

1 Automatic Grinding Machine for 8-in. S.C. band saws.

1 Hand Machine for cut-off saws.

1 Lap Grinder.

1 Set Band Saw Rollers and levelling blocks, with necessary swedges, a number of second-hand band, gang, edger and slash table saws.

POWER PLANT

2 Double Duplex, high pressure Water Pumps.

5 60-in. x 16-ft. Return Tubular Boilers, allowed 125 lbs. steam.

2 125 h.p. Water Wheels.

1 Upright Engine for sawdust conveyor.

1 10 h.p. Engine.

1 Mitts & Merrell Hog.

1 Wood Machine for 22-in. wood.

1 Edger for ripping dry lumber, installed.

1 Edger for ripping dry lumber, not installed.

1 30 h.p. Generator, 250 volt.

1 30 light arc generator.

There is also a large quantity of shafting, pulleys, hangers, belting, tram cars and turn-tables, particulars of which may be had on application.

All of the above open for inspection at Parry Sound.

The Parry Sound Lumber Co., Limited,

26 Ernest Ave. Toronto, Can.

THE FIELD LUMBER CO.
LIMITED

Manufacturers of
White Pine Lumber, Spruce, Lath and Shingles
Cedar Poles and Ties

Field, Ont, January 24th, 1916

Canada Lumberman & Wood Worker
Toronto, Ont.

Dear Sirs:

We have your favor of the 21st inst, re advertisement in "Canada Lumberman"—In reply, we beg to state that we have been able to close a deal for our 1916 cut of White Pine, and we are pleased to add that the advertisement in your paper has helped us materially in disposing of our lumber.

We are enclosing herewith Post Office Money Order to cover cost of two insertions of our ad in the Canada Lumberman as per the enclosed account.

Yours truly,

THE FIELD LUMBER CO., LTD.
J. U. Lamarree, Sec.-Treas.

A Small "Ad." Did the Trick

Here is another example of what a small want "ad." will do when inserted in our "Wanted and For Sale" Department. You may wish to buy lumber or dispose of some second-hand machinery, or perhaps you wish a new employee. Whatever you want, may be a small "ad." will put you in touch with the man you want.

We shall be glad to hear from you in time for our next issue.

What can we Advertise for YOU?

Not

A HOUSE

but

A HOME

is the title of our new Home Builders Book de Luxe. The cover is in six colors.

Of course you want your copy of this book. Just put it on your desk or counter where your customers can pick it up and look it over when they come in—they won't be able to resist doing so—and you'll behold the development of a new interest in home building.

In addition to supplying building hints, finishing formulas and full information regarding

ARKANSAS SOFT PINE

the book shows eight home designs ranging in price from $1,200 to $12,000. These will be invaluable to you in interesting your prospective customers up to the buying plant.

The book is free. Write for your copy early as the edition is limited. Address the Bureau.

All stock bearing the Arkansas Soft Pine Trade Mark is manufactured and sold exclusively by the following companies:

How about that car of finish

Stout Lumber Company, Thornton, Ark.
Valley Lumber Company, Reader, Ark.

DUNLOP

Some Facts Concerning "Dunlop"

The story back of the "Two Hands" trade-mark—the phenomenal expansion of the business, the widespread character of the demand—will appeal to every Canadian from the Atlantic to the Pacific.

* * *

While the name "Dunlop" in every part of the civilized world is associated with tires, the Dunlop Company manufactures practically everything compounded of rubber, and has a special experimental department devoted to the perfecting of established lines and to the creating of new ones.

* * *

The Dunlop Company is a truly Canadian institution, controlled by Canadians, and financed entirely by Canadian capital. For approximately one-quarter of a century this Company has successfully carried on the business of rubber goods manufacturing.

* * *

Some conception of how the Dunlop idea, applied to general rubber-made goods, has been popularized can be gleaned from this statement:—

"The factory additions for 1912 were alone nearly as great as the entire floor area of seven years previous; and in 1915 the additions were just double those of 1912."

Though the Head Office and Factories of the Company are located in Toronto, Branches, carrying complete stocks, are situated in the following cities:—Victoria, Vancouver, Edmonton, Calgary, Saskatoon, Regina, Winnipeg, London, Hamilton, Toronto, Ottawa, Montreal, St. John, Halifax.

* * *

Following along the best established custom for obtaining the most accurate estimate of Canadian conditions, the Branch Managers of the Company, from coast to coast, assemble at the Head Office periodically, and there in conclave present their viewpoints.

* * *

Officers of the Company regularly make tours of inspection from the Atlantic to the Pacific.

* * *

Thus, while the Company is essentially Eastern, each Branch, with its efficient staff, is a connecting link with the people of the different territories, an assurance that the Dunlop business is continental in its scope and national in its character.

Dunlop Rubber Belts

A judicious selection of Main Drive Belts will cut your belt bills in half, as well as minimize mishaps from belts going wrong.

* * *

All of our best experience in belt-making is represented in **"Gibraltar Redspecial"**—a friction face, main drive belt—a radically different, most unusual belt. No service is too exacting; no condition is too abnormal; no load is too heavy for "Gibraltar." Will not dry nor rot, and is practically immune to stretching, as it is made by a process that automatically removes this evil.

* * *

Dunlop **"Gibraltar Redspecial"** (Heavy Duck) is essentially a saw or lumber mill belt. It is giving wonderful service under most abnormal conditions. Its endless fund of toughness and great tenacity make it the ideal belt when constantly exposed to the elements.

* * *

Dunlop **"Gibraltar Redspecial"** (Light Duck) will be found most efficient on woodworking or other high-speed machines.

* * *

We, also, make rubber-faced belts in any grade for main drive purposes. Two of these brands—**"Peerless"** and **"Record"** are well-known for their superior qualities.

Rubber-Made Goods

DUNLOP

Dunlop Hose

Fire Hose is a necessary adjunct to the equipment of every saw or lumber mill, because the risk of fire in these industries is very great.

* * *

Adequate and efficient fire protection is secured only through the use of reliable hose—hose that is always ready for use when necessity arises—hose that will stand the utmost power and give the greatest wear.

* * *

These are two of the main characteristics of **"Dunlop" Double Jacket and "Imperial" Solid Woven Jacket Fire Hose**—two brands that are the pride of the largest fire departments in Canada. They, also, possess straight and smooth waterways, and the weight, grade and texture of the cotton jackets are always right.

* * *

We supply other brands of Fire Hose with single or double cotton jacket or rubber cover, in any grade to suit all requirements.

* * *

In this connection we wish you to remember that we are the only rubber company in Canada authorized by the Underwriters' Laboratories, Inc., Chicago, to manufacture Fire Hose bearing their rubber label of approval.

* * *

If you use water hose you won't be satisfied with any product other than Dunlop **"Hercules"** or **"Peerless"**—two brands of hose admirably adapted for water purposes. **"Hercules"** will supply the need for an unusual hose in case of abnormal usage.

Dunlop Packings

What Dunlop **"Sunset"** (red) and **"Admiral"** (blue) Packings have done in the way of giving extra service and reducing packing costs for the Steel Companies of Nova Scotia—or for that matter, countless big industries located throughout the Dominion—they can do for you.

* * *

For many years Dunlop Packings have been doing continuous duty in some of Canada's largest steel mills where abnormal service and conditions prevail—where a packing is subjected to the severest kind of tests—where its ability to do the work efficiently is a known factor from the beginning.

* * *

Is not this fact, then, tangible evidence of the character of the Dunlop product? Does it not satisfy you that Dunlop Packings are what you need to solve the "rising up-keep cost" problem?

* * *

We realize you want service from the packings you buy and we know that Dunlop Packings can give it. Supposing, then, we get together before you order your next roll of packing.

* * *

The Dunlop trademark will also be found on Square Duck, C.B.S. and C.I. Spiral, or, in fact, on any other kind of reliable packings required.

* * *

Tell us your requirements in rubber-made goods and we will endeavor to prove to you what you really need in Belting, Hose and Packings.

THE DUNLOP LINE

Consists of High-Grade Tires for Automobile, Motor Truck, Bicycle, Motorcycle and Carriage, and High-Grade Rubber Belting, Packing, Fire Hose and General Hose, Dredge Sleeves, Mats, Tiling, Heels, Cements and General Rubber Specialties.

TERMS OF SUBSCRIPTION

Canada, United States and Great Britain, $2.00 per year in advance; other foreign countries embraced in the General Postal Union, $3.00.
Single copies 15 cents.

"The Canada Lumberman and Woodworker" is published in the interest of, and reaches regularly, persons engaged in the lumber, woodworking and allied industries in every part of Canada. It aims at giving full and timely information on all subjects touching these interests, and invites free discussion by its readers.

Advertisers will receive careful attention and liberal treatment. For manufacturing and supply firms wishing to bring their goods to the attention of owners and operators of saw and planing mills, woodworking factories, pulp mills, etc., "The Canada Lumberman and Woodworker" is undoubtedly the most direct and profitable advertising medium. Special attention is directed to the "Wanted" and "For Sale" advertisements.

Authorized by the Postmaster General for Canada, for transmission as second class matter.

Entered as second class matter July 18th, 1914, at the Postoffice at Buffalo, N. Y., under the Act of Congress of March 3, 1879.

Vol. 36 Toronto, April 15, 1916 No. 8

New Brunswick Estimates Timber

According to an announcement made in the New Brunswick Legislature recently, the province has received in revenue from Crown Lands, during the seven years from 1909 to 1915 inclusive, the sum of $3,583,434, while the quantity of lumber cut from these lands during the same period amounted to 1,190,000,000 superficial feet. The importance of the lumbering industry to the province is clearly shown by this statement. Since the beginning of the war, although the lumber industry has been beset by many difficulties, it has gone steadily ahead and the report of the Department of Crown Land which has just been presented for the year ending October 31st, 1915, shows that the revenue for the year was the largest ever recorded. The single item of stumpage accounts for the large increase, leaving no doubt that the activity of the industry last year was greater than it has ever been in the past. The net revenue of the department showed an increase of $37,544 over that of the preceeding year and the increase in the stumpage receipts amounted to $34,284.

It is interesting to note the record of the quantity cut on Crown Land during recent years. In 1905 the total was 107,705,676 superficial feet. This increased gradually until it reached 149,510,471 feet in 1907. During 1909 it jumped to 205,761,583 feet, and in 1910 made a still greater gain, reaching 281,716,402 feet. During the following year, 1911, the high level was reached for the ten year period from 1905 to 1915, viz. 309,883,428 feet. During 1912-13-14 the amount declined, reaching 270,221,155 feet in 1913. Then in 1915, on account of the demand arising out of the war, it increased again and reached 290,120,823 feet. The interesting feature of this period is the increase to a little over 300,000,000 feet, which is a little over the estimated annual growth on the Crown Land of the Province.

Under these conditions it becomes imperative for the province to undertake a definite survey of its timber resources, so that its cutting policy may be directed along safe lines. Because the quantity cut may be the same as the quantity shown to be the annual growth, does not mean that the forests are being cut in a safe manner. The important thing is to make sure that the proper trees are being cut, those which are mature and those which, being cut, will give others a better opportunity to reach maturity. The indiscriminate cutting of small logs is a mistake, so far as the welfare of the forests is concerned, and the government of New Brunswick must pay special attention, under the conditions which exist today, to the proper regulation of cutting, so as to get the best results out of the forests and at the same time give reasonable encouragement to the lumber industry.

The Government have taken steps recently, we undrstand, to deal with this situation by appointing an experienced forester with instructions to make a survey of the forests of the Province and secure all the information essential for the proper regulation of lumbering operations. The survey, when complete, will show the areas of merchantable timber of all kinds, the amounts of each species, the approximate rate of annual growth of each, as well as the areas of good agricultural value and land suitable only for the production of timber.

Mr. P. Z. Caverhill late of the British Columbia Forestry Department is in charge of this work and it is expected that three or four field parties will be at work this year, comprising thirty or forty men, who should cover from 75 to 100 square miles per month. The number of field parties will gradually be increased to eight or ten. The whole work is expected to require four or five years.

Mr. H. R. MacMillan in India

The action of the Canadian Government in sending a Special Lumber Trade Commissioner on a trip round the world to enquire into export markets for Canadian forest products, is commented upon favorably by the daily press of India. During his presence in Calcutta, one of the newspapers referred to Mr. H. R. MacMillan's visit as follows:—

"In the past five or six years we have heard of very nearly all our colonies sending abroad all over the world Special Trade Commissioners. I have not seen it suggested that the Government of India have ever considered the question of appointing such Trade Commissioners to travel around and consider trade questions affecting this country. With all the talk we hear of India getting some larger share of the world's business after the war is over, it rather strikes one that the present would be an excellent time for a representative of Government in the Commerce and Industry Department to make a tour round and see a few things from a practical point of view in relation to Indian trade requirements and the capabilities in the way of supplying products. The Canadian Government saw the possibilties of the position months ago and we have in Calcutta now the Chief Forester of British Columbia who has been sent round the world by his Government as a Special Lumber Trade Commissioner; one of the ideas of Mr. MacMillan's commission seems to be an investigation as to the possibility some day in the near future of trade reciprocity between Canada and India. Hitherto, as is well known, such Indian commodities as there is a demand for in Canada have gone into the Dominion Colonies via America with the assistance of American finance and through American merchants. But as the purchasing power of Canada increases, it stands to reason, Canadian merchants should be able to, and should be encouraged to deal direct with this country. The ports in British Columbia should offer as good entrepots for merchandise from India as any on the American Pacific coast. The establishment of a direct steamship line between India and Canadian Pacific coast ports is only a matter of time. It is understood that the policy of the Canadian Government is not to subsidise impractical dead heads, but to assist its active industries by introducing them to the notice of the world's markets; and at the same time assuring consumers abroad that Canada is capable of supplying what her Government Department, after investigation, are satisfied that she can supply. It is a simple proposition after all, and it is real business, and about as far as a government ought to go. There is probably less commerce subsidising by foreign governments than many of us believe. Subsidies are not always the best incentive to forcefulness and independence and self reliance."

Important U. S. Railroad Rate Hearing

The most important railroad rate hearing in the history of the Interstate Commerce Commission, of the United States, at which the whole problem of rates and classification of lumber will come up, has been announced for this summer in Chicago. After years of special hearings by various examiners and commissioners, the chairman of the commission will himself take charge of the investigation.

The problem will be taken up at the Chicago hearing soon after July 1, and will be discussed until the whole problem has been gone through to the very bottom, from every angle. When this hearing is completed it will have been the most thorough ever held of rate problems, and will form the basis for the adjustment of railroad rates on lumber in all parts of the United States. It will settle problems of classification, carload shipments of mixed products, and a thousand and one special problems.

As a phase of the hearing, the National Lumber Manufacturers' Association has begun the compiling of detailed records of 50,000 carload shipments in three months of the past year. These tabulations will provide the most exhaustive record of freight shipments ever computed. Manufacturers are being asked to provide the National Association, on special blanks, records of all their shipments for the months of January, May and September, 1915, and the exhaustive nature of the inquiry is shown by the following list of questions to be answered relating to every one of these 50,000 carloads: Date of shipment, car number, weight, rate, total freight charges, invoiced value of carload, f.o.b. mill, destination, routed kind of timber, thousand feet in each car of dressed, also of undressed lumber, quantity of other products and their nature, and the amount of loss and damage claims filed. The form gives in addition the name of the firm, its shipping point, and the railroad over which shipped.

The attitude of the lumber manufacturers is shown by the following resolution adopted at the special transportation committee meeting, representing lumber manufacturing, wholesaling, and retailing and allied interests:

"Be it resolved that this body is strongly of the opinion that there should be no change in the classification of lumber and lumber products which would or might result in different rates on the ordinary and customary products of the lumber manufacturing plants, whether shipped in straight or mixed carload lots.

"That this body is convinced that lumber has borne more than its proportion of the expense of transportation, and any re-classification will only result in a higher basis of rates."

The purpose of the lumber manufacturers is to secure a rate agreement for the future which will prevent all discriminations between various sections, and most of all to secure a general broad ruling which will prevent the necessity for constant local rate contests, before state commissions, and involving constant conflict between the railroads and the lumbermen. With one general agreement reached, present high costs for these constant rate hearings will be ended, and future differences very largely minimized.

Ontario's Forest Revenue for 1915

The annual report of the Woods and Forest branch of the Department of Lands, Forests and Mines for the Province of Ontario for the year ending October 21st, 1915, reflects fairly definitely the situation which existed in the lumbering industry during the year. The lumber business in Ontario suffered greatly last year on account of the falling off in the local demand for lumber and on account of the difficulty experienced by exporting firms in making shipments of their product. The revenue accrued to the Province from woods and forests on Crown Lands amounted only to $1,629,640, which is a decrease of $379,481, as compared with the preceding year. As compared with 1913, the last complete year during which the influence of the war was not felt, the decrease is still greater. During 1913 the revenue amounted to $2,127,222, which is $497,572 greater than the revenue of 1915. The revenue receipts from 1911 to 1915 inclusive were as follows:—1911, $2,151,258; 1912, $2,068,060; 1913, $2,127,222; 1914, $2,009,131; 1915, $1,629,640, showing an almost continual annual decrease since 1911.

Most of the decrease during 1915 can be accounted for by the decrease in the quantity of railway ties taken out, the total being only 729,164 ties as against 5,439,845 during 1914. The railway companies did practically nothing last year in the way of purchasing ties, whereas during the two or three years preceding they had bought heavily. During 1913 they took 6,555,828 ties, during 1912, 5,704,459 and during 1911, 4,270,832.

Another important decrease during 1913 was in timber dues which amounted to $928,351, a decrease of $184,129. During the previous four years the revenue from timber dues was as follows: 1914, $1,112,480; 1913, $1,277,490; 1912, $1,339,957; 1911, $1,173,283.

The itemized report of production during 1915 includes:—383,918,834 feet B. M. of pine saw logs; 54,668,902 feet B. M. of other saw logs; 20,922,922 feet B. M. of pine boom and dimension timber; 3,413,160 feet B. M. of other boom and dimension timber; 266,949 cubic feet of square pine timber; 4,790 cords of tan bark; 301,061 cords of pulp wood and 729,164 railway ties.

Revival in Lumbering

In an article dealing generally with the industrial position in Canada published recently by the Globe, the following reference is made to the situation in connection with the lumbering industry, under the heading "Revival in Lumbering":—

"Another important industry which will emerge from the war upon a more substantial basis than ever before is that of lumbering. The decision of various Dominion Government departments having to do with the construction of public buildings, etc., to use nothing but Canadian timber in the future has been followed by some large corporations. As is pointed out by "Conservation," Southern pine, even in 1915, when Canada was at war, and when there was a great decrease in the consumption of lumber, was imported to the extent of 95,000,000 feet, having a value of over $3,000.000.

"The Dominion Government has in past years used many million feet of Southern pine in various public works, but henceforth Canadian timber will be used. Douglas fir will replace Southern pine in such works as Quebec and Montreal harbor improvements and Hudson Bay terminals. Douglas fir has been used entirely in the Toronto harbor works, as a clause was inserted in that contract calling for Canadian material. The action of Baron Shaughnessy in ruling that Canadian timber only shall be used in works of the Canadian Pacific Railway shows that large private users are also finding it consistent with present conditions to use Canadian products. Architectural and engineering professions also are replacing Southern pine by Douglas fir, and the imported woods by the homegrown product.

"Lumbering interests, both in British Columbia and New Brunswick, state that the slump in lumber is over, and that improved conditions in the lumber trade are looked for during this coming summer. Returns throughout the Province of New Brunswick show that the cut this winter will be much larger than was anticipated at the opening of the season, nearly all the mills taking out more lumber than they originally intended to. It is stated that the sawmills will be operated throughout the entire coming season in order to clear up the unusual amount of timber taken out. The deep snow interfered to some extent with the British Columbia production."

Editorial Short Lengths for Busy Readers

Hon. Lorne Campbell, in a speech in the B. C. Legislature, referring to the lumbering industry recently, said:—"The striking methods adopted by the Provincial Government in alliance with the agricultural authorities of the prairie provinces have received a great deal of attention. The main idea underlying this work has been to increase the consumption of the lumber by making it easy and profitable for the prairie consumer to use lumber. In connection with this work a quarter of a million pamphlets, giving up-to-date building plans and agricultural information are being supplied to prairie farmers, and the marketing of British Columbia lumber is being closely studied through the establishment of a branch office of the department at Regina. The value of forest products for the calendar year 1915 is estimated at $29,150,000, a slight advance over the figures for 1914. Owing to the severe depression the total for the year is several million dollars lower than during 1912, but the province is to be congratulated on the fact that the depression of the lumber business is now a thing of the past and that both the market for lumber and the ruling prices are extremely satisfactory. The effect of the revival in the lumber industry will soon be felt throughout the province, for no other industry has circulated money faster or better. One of the pleasing features of the industrial situation, so far as forest products are concerned, is the prosperity of the pulp and paper mills. In addition to two working full time, the Ocean Falls plant is making ready to begin operations."

Canada's imports of pitch pine, lumber and timber, planks and boards, rough, sawn or split during the ten months ending January, 1916, amounted to 38,935,000 feet B. M., valued at $633,170. There has been a continued falling off in the quantity of imports under this head during the period of the war. For the fiscal year ending March 31, 1915, the imports were 95,182,000 feet B. M., valued at $1,608,788. For the fiscal year ended March 31, 1914, the imports amounted to 135,348,000 feet B. M., valued at $2,912,363.

The imports of oak from the United States also shows a heavy decrease. For the ten months ending January, 1916, the total was 19,854,000 feet, valued at $749,081. During the two previous fiscal years the totals were as follows:—1915, 34,454,000 feet, valued at $1,437,924; 1914, 62,848,000 feet, valued at $2,660,839. During the fiscal year ending March 31, 1913, the imports of oak were even greater, amounting in value to $3,227,113.

The imports of planks, boards, etc., dressed on one side only from the United States during the ten months ending January, 1916, amounted to 54.098,000 feet, valued at $855,475. During the fiscal year ending March 31, 1915, the imports under this head amounted to 135,375,000 feet, valued at $2,322,368. During the fiscal year ending March 31, 1914, the imports under this head amounted to 238,688,000 feet, valued at $4,428,341.

In the B. C. Legislature on April 3rd, Hon. W. R. Ross explained the proposed vote of $50,000 to aid the lumber industry of the province. He stated that agencies had been opened at Regina, Toronto and London, England, which were maintained under this vote and were stimulating the demand for British Columbia lumber. In reply to an enquiry regarding orders from the British Admiralty which were being placed with Oregon and Washington mills, Hon. Mr. Ross said that this had been a matter of much anxiety to the Government for a time, but that, when these purchases were made all purchases on this continent had been going through the agency of the J. P. Morgan Company. Now, however, the B. C. Government had got into direct contact with the Admiralty and hereafter business of this sort would be handled direct between British Columbia and the allied countries.

Plans are under way for the formation of a company to build ten large lumber schooners at Tacoma, Wash. The vessels are to cost from $70,000 to $80,000 each. They will be about 225 feet long, constructed of wood, four-masted and equipped with Diesel engines. They will have a capacity for carrying 1,500,000 feet of lumber each. The vessels will be built one at a time.

Canadian exports of forest products during February were valued as follows:—1916, $2,595,420; 1915, $2,342,590; 1914, $1,961,206. For the twelve months ending February the exports of forest products were valued as follows:—1916, $51,464,650; 1915, $41,904,728; 1914, $42,456,502.

New York a Gilded Tragedy

(Sydney Brooks in North American Review)

To come from England to Manhattan Island, from a country strung up as never before in its annals to the heroic pitch, full of the spirit of sacrifice and endurance and in daily touch with the grimmest facts of life and death—to come from such a country and to land in New York is to make a change indeed. For New York, always a feverish and pleasure-loving city, is today simply drunk with money. Even during the height of the steel boom of twelve or thirteen years ago, when every train from the west seemed to bring fresh carloads of brand new millionaires, the metropolis was not so openly reeling with dollars as it is at this moment, when the gayest "season" of its history is drawing to a close.

It almost appals an Englishman to find there in full swing the old rotten life that we in England have put completely behind us. And it appals him still more to reflect that a bare two years ago he was leading, if one allows for the extra intensity that New York throws into all its activities, very much the same life himself. One despairs of ever being able to convey to one's American friends how completely the war and its conditions and consequences has become not merely a part of, or a side issue to, but literally the whole British existence. They are so dominant, have so utterly swallowed up everything else, that no other form of life, least of all the trivial carelessness of peace, seems normal or even credible.

I catch myself in New York, if I enter a lighted room, instinctively reaching out to draw down the blinds lest a Zeppelin raider should note the glare; and of all the sights that crowd in upon me, that of multitudes of young men who are not in kahki strikes me as the strangest and the most repellent. It may be one more proof of our demented state, but it is the bare fact that not for anything would we in England change places with you in America or part with the waste and misery of the war to receive in return the "blessings" of such a peace as yours. Stay-at-home Americans simply cannot enter into or even conceive the atmosphere of the belligerent nations in this struggle; and conversely, so long as it lasts, a visitor from any one of the countries at war will continue to be shocked by the atmosphere of America as something unnatural to the point of being grotesque.

In New York the fact and the vastness of this chasm of sentiment assail the visitor with the sharp finality of a bayonet thrust. Louvain and Rheims are among the stricken victims of the war, but New York is its supreme and gilded tragedy, and has, I fear, neither the sense nor the soul to know it. Americans must by now have heard of the English charwoman whose husband was at the front and who was drawing her weekly allowance. She was asked what she thought of the war.

"What!" she replied. "A pound a week and no 'usband! Why, it's 'eaven! It's too good to last!"

There is something in New York's attitude towards the war which reminds one of this simple soul.

Architect Urges Use of Canadian Woods

A. R. Denison Sounds Praises of B. C. Douglas Fir—Gives Retailers a Pointer About Getting Their Money

At a recent weekly meeting of the Lumbermen's Section of the Toronto Board of Trade an address was delivered by Mr. A. R. Denison, of the firm of Denison & Stephenson, well known Toronto architects. Mr. Denison spoke on two subjects, one being the importance of using Canadian timber whenever possible and the other being a suggested plan for co-operation between lumbermen, architects, and owners of buildings under construction, with a view to making more satisfactory arrangements for the settlement of lumbermen's accounts for material supplied.

In opening his remarks Mr. Denison stated that he had made a hobby of the erection of mill-constructed buildings. He believed that they were a better class of building for commercial purposes than steel and concrete construction. He had put up a great many mill-constructed buildings in Toronto and elsewhere and had thus come into pretty close contact with lumbermen, as a large percentage of the cost of these buildings was in timber and lumber. In a recent case, when putting up a building of this class, he had taken special precautions to secure the lumberman—to see that the latter got his money. He had made a verbal arrangement with the contractor, the owner and the lumberman, to the effect that he should state in his progress certificates the proportion of money that was to be paid to the lumberman when the contractor presented his certificate to the owner. Unfortunately there had been a missing link in this chain. On the first certificate he assumed that the lumberman had got his money. On the second certificate he made the same assumption. When he issued the third certificate, however, he got a hint that the lumberman had not been getting his share, so he called him up and asked him about it. The lumberman and the contractor were friends and the lumberman said that the contractor was all right and that he was sure he would get his money. It turned out that the contractor had been paying the lumberman some of his money and giving him notes for the balance and that he had then over $5,000 of money in his possession that should have gone to the lumberman. After that, Mr. Denison had made a new arrangement and the money was paid by the owner straight to the lumberman, while the architect still held back the 20 per cent. allowed by the law. This lumberman had accepted a note for 60 days. The architect could only hold the 20 per cent. for 30 days. He was really powerless to help the lumberman unless the latter would co-operate with him fully.

Separate Cheques For Lumber Bills

Mr. Denison went into this situation more in detail and finally asked why something should not be done to put the whole situation beyond any peradventure. It seemed to him this would be quite easy if the interested parties would get together. His idea was that an arrangement should be made in writing between the proprietor and the contractor at the time of signing the contract, requiring the contractor to submit to the proprietor a summary of the lumber to be used in the building; and further, that a statement should be rendered to the proprietor from time to time during the continuance of the work, and that the proprietor should be required to draw separate cheques in favor of the lumber merchant as each certificate became due; the lumber merchant to be subject to a drawback clause of 80 per cent. in the contract and also to have a claim upon the 20 per cent. retained by the architect; a duplicate statement to be rendered to the architect if required. He believed that a plan of this sort, in which the owner, the architect and the contractor co-operated would remove a great deal of trouble. If the lumbermen would take it up and pass a definite resolution in regard to it, asking the architects to co-operate, he would put the matter before the architects, and felt pretty sure that they would fall in line.

Canadian Timbers the Best

Mr. Denison is a strong advocate of using Canadian timbers wherever possible, and, in discussing this subject, referred to the fact that the original Toronto city by-law made Georgia pine the basis for timber construction purposes. He had asked the city architect to use B. C. fir for such purposes and had simply been told that it was not allowed by the by-law and could not be done. This was a mistaken view of the city architects's business. He should have been interested solely in the strength of the timbers used, not the variety of timber. Alhough he expressed this opinion to the city architect at that time, the reply he received was simply that Douglas fir was not allowed by the by-law and he was not going to permit it to be used. Mr. Denison stated that he had told the architect he was going to put up two buildings near one another. One of them would be of Douglas fir and one of Georgia pine and the city architect could try to stop him if he liked. He went ahead. The timber was delivered on the job and he was told to stop. He did not stop and was hailed before a judge who upheld him, saying that he was quite within his rights so long as the timber used was of the required strength. In order to satisfy themselves regarding the strength, Mr. Denison told them to select timber from the piles that had been delivered for the jobs. This was done, a sample being taken from each job. He stated that if the result did not show that Douglas fir was better than Georgia pine he would be willing to pay the cost. The Georgia pine selected was 8¼ in. x 19¾ in. x 18 ft. long. The Douglas fir stick was 8 in. x 19¾ in. x 18 ft. long. The tests were made at the School of Practical Science, Toronto. The Georgia pine stick broke off at 43,550 lbs., and the Douglas fir stick split lengthwise but did not break at 55,320 lbs. From that day on they had been allowed to use Douglas fir.

Douglas fir was unquestionably the best wood they could get for construction purposes. It was also the strongest wood and it was one of our own native woods. He urged that lumbermen, architects and contractors should put forth every effort to use Canadian materials on Canadian buildings. Mr. Denison referred to instances of failure that he had come across in using Georgia pine. He had been obliged to take out at least six sticks of long leaf pine within five years from the time they were put in, because of dry rot. There seemed to be a failure in a certain percentage of Georgia pine stock. It really required an expert to know Georgia pine. In fact, he had known of men who called themselves experts, who differed with one another in deciding whether certain southern timbers were long leaf pine or not. He had always found that Georgia pine checked to a greater extent than Douglas fir. It was also much more combustible, as it was full of gum and was easy to set on fire.

The speaker urged the lumbermen to commence at once upon an effort to encourage the use of Canadian woods. The Dominion Government had taken a step in this direction by passing an order that nothing but Douglas fir was to be used in the construction of public works. If an effort were made along this line and followed up vigorously it would make a great difference to Canadian lumber manufacturers. He understood that during the last year over four million dollars worth of Georgia pine had been imported into Canada. In normal times he understood that the amount was far greater.

Where The Architect Suffers

At the bottom of all this question there was a very sore point. Frequently they would see a company with a name that would lead one to suppose that it was a Canadian company, who in the construction of large buildings employed American architects. The American architects would naturally specify American brick, American wood, etc. Every lock, every fitting, the plumbing, everything throughout the building would be brought in from the United States because the architect would be getting his percentage on every one of these items. Canadian architects would not be allowed to put up buildings in the United States. Canadian dentists, veterinary surgeons, lawyers, doctors, all classes of professional men, except the architects were protected against this sort of thing. Moreover the brick-layer and the carpenter were also protected in Canada to a certain extent by the alien labor law. In this way the Americans were cutting both the lumbermen and the architect out of their own business. In order to carry out this kind of work the contractor who wanted to make use of a United States architect had no trouble at all. He simply obtained blue prints and had them put through the customs at their cost, paying in duty a nominal sum of a few dollars. Under present conditions there was no escaping from this situation, but he believed that the architects, in a short time, would make an effort to have the law enforced more fairly in connection with the importation of plans.

In conclusion Mr. Denison repeated his hope that the lumbermen would do something definite in regard to his suggestion about co-operation between owners, contractors and lumbermen, regarding the issuing of separate cheques during the progress of the work. An interesting discussion followed Mr. Denison's remarks and the chairman, Mr. J. B. Reid, stated that he and Mr. W. J. Hetherington would act as a committee to draw up a resolution upon Mr. Denison's proposal. This resolution would be submitted to the section at a later meeting and he expected that, in the very near future, something definite would be forthcoming to lay before the architects. Mr. Denison repeated his assurance that if this were done the architects would be ready to co-operate.

Death of Donald Fraser Sr., Fredericton, N. B.

The Late Donald Fraser, Sr., Fredericton, N.B.

Mr. Donald Fraser, Sr., of Fredericton, N. B., one of the most extensive lumber dealers in Eastern Canada, died on April 4th at his home in Fredericton, after an illness of less than one week.

The late Donald Fraser was born at Drumoak in Aberdeenshire, Scotland, on February 5th, 1842 and began his business career in Aberdeen where he formed a partnership with his brother Alexander under the firm name of A. & D. Fraser, Timber Merchants. This business was continued until 1873 when Donald Fraser, Sr., moved to New Brunswick. There he settled on a farm at Kincardine, Victoria County. Four years after his arrival in New Brunswick he went once more into the lumber business, locating at River De Chute, Carleton County, N. B. During the next seventeen years he laid the foundation of the business with which his name has since been associated.

In 1894 Mr. Fraser built the "Aberdeen Mill" at Fredericton, which was subsequently destroyed by fire. In 1899, together with his sons Donald and Archibald whom he had taken into partnership, he acquired a lumber business in Temiscouata County, Quebec, and built the town of Cabano. In 1902 he purchased the business of the Tobique Manufacturing Company in Victoria County, N. B., re-organizing it under the name of the Fraser Lumber Company, Limited. In 1906 the business of the St. Francis Lumber Company at Whitworth in Temiscouata County was purchased and organized under the name of F. & M. Lumber Company, Limited. In 1911 Mr. Fraser bought from James Murchie & Sons Company the Murchie Siegniory in Temiscouata County and the milling business at Edmunston, N. B. organizing them under the name of Fraser Limited, which now controls all the Fraser business in New Brunswick aside from that on the Tobique River.

In 1913 the Scott Lumber Company and the Oromocto Lumber Companies' properties were acquired and consolidated by Fraser Limited. In 1914 the Fraser interests acquired the Assametquaghan Limits in Bonaventure and Matane counties and the Chabot Limits in Kamouraska County, Quebec. In 1915 Fraser Limited took over the Timothy Lynch Company's business on the Miramichi and began the construction of the new sawmill at Nelson, N. B., while the F. & M. Lumber Company, Limited, began the construction of a new mill at St. Eleuthere, in Kamouraska County, Quebec.

The late Mr. Fraser was President of all the Companies bearing his name and took an active interest in their affairs up to the time of his death.

Mr. Fraser was a devout member of the Presbyterian Church, a man of strong faith, and widely recognized as not only a successful business man but a man of wide human sympathies. His loss will be a great one both to the lumbering industry and to the people of New Brunswick.

David MacLaren of Ottawa Passes Away

David Maclaren, one of the best known lumbermen of the Ottawa Valley, died at his home in Ottawa on April 7th, after a lingering illness. The late Mr. Maclaren was born in Masham Township, Quebec, on October 5, 1845. His father, James Maclaren, was one of the foremost lumber merchants of Canada. David Maclaren was quite a young man when he entered the business with his father in 1871. In 1874 he took over the management of the Gatineau and Ottawa Rivers Branch of the business, with headquarters at Wakefield, P. Q. He took a great interest in municipal and financial affairs and also contributed liberally to many charities. He was a director of the North Pacific Lumber Company, Limited, the Jas. Maclaren Company, and a number of others, besides being a former president of the Bank of Ottawa.

Mr. J. J. McNeil, Toronto, died on April 8th at the age of 65. The late Mr. McNeil was for many years prominent in the lumber business in the Muskoka district. He moved to Toronto in 1897 and from that time had been associated with the Metagama Lumber Company, W. J. Sheppard & Company and the Spanish River Pulp and Paper Company. Since 1907 he had been operating in the Temiskaming district.

Forestry Battalion Ready to Embark

The 224th (Forestry) Battalion, under the command of Lt.-Col. Alex. McDougall, which has been raised to cut timber in Great Britain and France, has been completed to a strength of 1,525 men and has now been mobilized at Quebec. It will proceed to Great Britain as soon as transports are available. A new record in recruiting and mobilization has been established by the battalion. The men were mobilized within three weeks from the day when recruiting started. By next month the battalion will be actively at work cutting forests in England and Scotland and providing timber and material required at the front. Subsequently they will proceed to France and will engage in similar work there.

In connection with the 224th (Forestry) Battalion, the Patriotic Fund, headquarters at Ottawa, have come to a decision that the Battalion cannot be regarded as in the same class as combatant units and that the families of men serving in this battalion should not be entitled to assistance from the fund. However, if a man whose family is already being assisted by the fund, having enlisted in a combatant battalion, is transferred at the will of the militia authorities and not at his own request, into the Forestry Battalion, his family is entitled to special consideration, and may be assisted at the usual rates. Also, if a member of the Forestry Battalion is transferred to a combatant battalion his family may be given special consideration.

B. C. Manufacturers Want Export Duty on Logs

Representatives of lumber and shingle manufacturers interviewed the Executive Council at Victoria, B. C., on April 4th, to press their request for an export duty upon logs. They claimed that they were now able to take care of all the logs furnished by the logging companies in British Columbia, but, owing to the fact that the export duty had been waived by the Government a large quantity of logs were being exported to the United States, where higher prices were offered.

Representatives of the loggers were also present and stated that they were quite willing to sell to B. C. mills, but that the B. C. mill men could not afford to buy. They argued that they should be given the privilege of an unrestricted market.

This matter has been before the Government for some time. The Premier will give a decision as early as possible.

Western Timber Beginning to Move

The Prince Rupert Timber and Lumber Company, Vancouver, B. C., have sold ten timber claims, comprising over 125 million feet of timber, largely Douglas fir, to the Seymour Lumber Company, of Minneapolis, Minn. The claims are in one block on Sechelt Inlet, within 65 miles of Vancouver. The Seymour Company intend to take the timber off as soon as possible and is said to have already completed contracts for logging. The price paid was $125,000, or $1 per thousand on the stump.

The Prince Rupert Timber & Lumber Company have also sold to the Finger Lumber Company, four timber berths, near Prince Albert, Sask., comprising about sixty million feet of timber, the price being $60,000 cash.

Mr. E. H. Moore, president of the company, in a recent interview, said that the present outlook for timber was encouraging. There was more enquiry of a really serious nature than there had been for the past ten years. Only the scarcity of money had prevented the closing of a number of good offers they had received lately for tracts of timber on the coast. The demand for small tracts of good timber, running well to cedar, has been very active.

Cost of Making Shell Boxes

It has been popularly supposed that the manufacture of ammunition boxes was very simple and that it was a most lucrative form of business requiring little experience. Those who were engaged in the box business prior to the war, however, know that the margin between cost and selling price has been very small, and that the balance will be on the wrong side unless the items of expense are watched very closely. Contracts for shell boxes have been accepted at what seem to be unprofitable prices, and in the April issue of the "Canadian Woodworker and Furniture Manufacturer," Toronto, an authority on the subject has written a lengthy article showing in detail what it costs to manufacture the 18-pounder 6-round shell box, which has been produced in large quantities. The figures he gives are instructive and should be studied by all who are interested in knowing their costs. They are equally applicable to the other styles of shell boxes.

The Brooklyn Lumber Company, Hants County, N. S., will have a cut of about 8,000,000 feet this summer; Ira C. Crowe will cut 4,000,000 feet; Mr. Bullivant, 4,000,000 feet; Geo. Cole, 2,000,000 feet; Watson Burgess, 1,000,000 feet, and John McClair 1,000,000 feet.

Annual Report of B. C. Forest Branch

Statistics of Output—Market Extension Campaign Results—Forest Fires Well Controlled

The annual report of the Forest Branch of the Department of Lands of British Columbia, for the year ending December 31st, 1915, has just been published. The report opens with an outline of the market extension work carried on by the Branch, referring chiefly to the work of Mr. H. R. MacMillan, Chief Forrester of the Province, who is now on a trip around the world investigating the export markets for Canadian timber and lumber. Referring to Mr. MacMillan's work in Great Britain, the report states that a number of orders were received through his activities there, and gives the following list of cargoes handled through the Forest Branch:—

	Approximate Value F.A.S. Vancouver.
S.S. "Llandudno," 3,000,000 feet, clears, timbers, merchantable, and ties	$ 32,000
S.S. "Orange River," 4,000,000 feet timbers, merchantable, ties, and common	38,000
S.S. "Llangorse," 3,000,000 feet, merchantable, ties, and common	27,000
S.S. "Otto Tretchmann," 3,000,000 feet, clears, merchantable, and ties	40,000
S.S. "Karma," 1,250,000 feet, merchantable, and common	12,000
S.S. "Harewood," ties	2,000
Via St. John, 320,000 boxes worth	40,000

Referring to these shipments the report states that a notable feature of the business was the proportion of lower grades taken. In addition, 956,000 feet, worth $15,000, was lifted by the prize vessel "Grahamland," which was lent to the Provincial Government for this purpose, making a total of $206.000 in addition to other cargoes placed in the Province as a result of representations made by the Provincial Government. This promising line of business with the British authorities was nipped in the bud by the disastrous slide in the Panama Canal. Although an attempt has since been made to do business by combined rail-haul and Atlantic shipment via St. John, orders have not yet been secured, in spite of a considerable reduction in freight rates offered by the railways. The only exception in this has been the securing of an order for 320,000 boxes which the Forest Branch is handling for the War Office during the present month.

The most notable feature of this work was the excellent way in which the export mills of the Province came together to share orders. The need for co-operative action was indeed one of the matters emphasized in every report received from Mr. MacMillan. His recent investigation into the South African market, for instance, shows that while co-operation among British Columbia mills is a first essential for success, a stable market for Douglas fir there can never be secured until some international agreement is reached that will bring the present suicidal cutting of Pacific Coast export prices to an end.

Referring to domestic markets the report says:—While British Columbia, by reason of location and export facilities, must make every effort to secure its full share of the export lumber trade, the main markets for its products are on this continent. In proportion to population Canada uses more lumber than any other country, and despite the fact that, with the exception of the Prairie region, the Dominion is essentially a forest country, the timbered areas of Eastern Canada are already unable to supply the local demand. Both Eastern Canada and the Prairie Provinces have in the past imported hundreds of millions of feet of rough lumber from the United States.

The largest market for British Columbia lumber will always be in neighboring Prairie Provinces, which consume at least 60 per cent. of the total B. C. production. It was the shrinkage in the Prairie demand, combined with the heavy fall in lumber prices and the decrease in consumption in British Columbia itself, which brought about depression in the industry of this Province. With town and city building operations in the West at a standstill for the time being, and with the existing programme of railroad construction more or less completed, the difficult problem of how to increase the consumption of lumber in the Province has been pressing for solution.

British Columbia Commissioner in Eastern Canada

In the aggregate the departments of the Dominion and Provincial Governments and the larger cities are purchasers of lumber on a very large scale. Railway-construction, harbor improvements, and other public works consume considerable quantities of heavy timber. Then there are immense quantities of lumber used in general building-work.

Besides this large market in Eastern Canada for dimension lumber, there is a very extensive demand for moderate-priced wood for interior finish. From the earliest times the Eastern lumber market has been supplied by Ontario white or Norway pine, and in recent years to a large extent by imported southern pine.

British Columbia possesses dimension and rough lumber of a quality equal or superior to imported stock and wood for inside finish which for beauty of grain is unsurpassed except by hardwoods. Eastern Canada constitutes a natural field for expansion of British Columbia's lumber market, particularly since the completion of the Panama Canal has rendered direct water shipment possible.

In taking up market extension work it early became very evident that the educational methods adopted by private organizations to create a market for their product would have to be adopted if effective results were to be obtained quickly. This involved placing before dealers, consumers, and possible purchasers the facts concerning the qualities, merits, and uses of woods and wooden products. Information covering these subjects was collected and printed in the form of pamphlets. These were distributed either direct to the classes who would be specially interested or in response to inquiries received through publicity work.

The production of lumber in British Columbia during 1914, compiled from returns supplied to the Forest Branch by the lumber industry was as follows:

	Board-feet.
Saw-timber	833,437,000
Shingles, 972,935 M.	97,293,000
Hewn ties, 2,403,197 ties	75,100,000
Piling, 9,722,171 lineal feet	48,611,000
Poles, 4,339,234 lineal feet	21,696,000
Fence-posts, 38,430 cords	14,215,000
Mining-props, 23,102 cords	11,551,000
Total	1,151,903,000

Comparing this with the returns for the other provinces as supplied by the Dominion Forestry Branch, we find that British Columbia led in production, though only to a slight degree over Quebec.

British Columbia	1,151,903
Quebec	1,118,298
Ontario	1,044,131
New Brunswick	414,808
Nova Scotia	279,044

Estimate of Value of Production, 1915

The products of the forest are numerous, but they may be roughly divided into classes indicated below; the value of each product includes any transportation charge in the Province.

Lumber	$ 15,500,000
Pulp	3,200,000
Shingles	3,500,000
Boxes	750,000
Piles and poles	1,200,000
Mining-props and posts	400,000
Miscellaneous (cut by railroads, mines, settlers, hewn ties, cord-wood)	900,000
Additional value contributed by wood-using industries, planing mills, sash and door factories, cooperage, wood pipes, slab fuel	1,750,000
Product of Dominion lands	1,800,000
Lath	150,000
Total	$ 29,150,000

This large amount is well distributed, as there are practically no districts or communities that are not directly influenced by the harvesting of the timber resources of the Province.

British Columbia, from its position relative to markets, has no large wood-working industries. This is shown by the fact that out of all the timber sawn in 1914 only 20,000,000 was used as a raw material for further manufactured articles. Of this 18,000,000 was manufactured into boxes, 1,000,000 in sash and doors and interior fixtures, 200,000 in cooperage, and the balance in a number of smaller uses, such as caskets, cars, boats, etc. This remanufacture is an important asset to the Province and should be encouraged in every possible way. The more valuable the finished product that is sold the more money that is left in the Province in labor, supplies, equipment, etc.

The wood-using industry of Ontario, for instance, is worth $19,000,000 a year according to statistics gathered by the Dominion Forestry Branch. This is made possible by the large market of Eastern Canada, which uses large quantities of wood in the manufacture of sash and doors, boxes, furniture, vehicles, implements, slack cooperage, etc.

British Columbia has not got a large market close at hand which demands these products. Moreover, in any new country the first step is to manufacture lumber which can be sold for a multitude of uses, instead of specializing on special articles of higher manufacture with a more uncertain market. It is true, however, that the very fact that British Columbia lumber product has to stand a relatively high transportation cost makes it all the more imperative that the products transported should have as high a value at the shipping-point as possible. Why, for instance, should British Columbia sell lumber to Ontario, there to be manufactured into doors? Instead of

this, British Columbia should sell the doors and save freight on sawdust and shavings.

There are many articles which can be manufactured completely in British Columbia; some, like doors, in the complete condition; others, like silos, tanks, and even houses, "knocked down" for shipping.

Timber Scaled, 1915.

The scale returns are a good index of the activity in the lumber industry throughout the Province. The salient features of the figures for 1916 are the increased cut of logs and cordwood and the decreased cut of piling and ties. The lower figures for the latter items are due to the smaller amount of railway-construction, which consumes immense quantities of these articles.

The increase in cordwood returns is accounted for by the steady market for shingle-bolts.

The increase in the log returns came almost entirely from Vancouver, the cut in the Interior districts being markedly less than in previous years. In the northern districts operations were practically at a standstill.

Nearly 25 per cent. of the timber cut in B. C. comes from the very old Crown grants, over 30 per cent. from timber leases and licenses, 30 per cent. from the Dominion Railway Belt, 16 per cent. from Crown grants issued since 1887, 10 per cent. from timber-sales, and a few million feet from railway permits.

Of the many species of timber cut, the largest quantity, 22 per cent., was supplied by Douglas fir, closely followed by western red cedar, with 35 per cent. of the total.

Hemlock and spruce each supplied between 7 and 8 per cent., western larch nearly 4 per cent., and western soft pine 3 per cent. Jack or lodge-pole pine furnished nearly 7,000,000 feet, or ¾ of 1 per cent. of the total, while western or Idaho white pine gave 5,000,000 feet out of 1 per cent. Balsam fir and cottonwood each supplied 1,000,000 feet, and yellow cedar and alder furnished a few thousand feet.

The species of lumber cut in British Columbia during 1915 were as follows:

Douglas Fir	426,232,000 feet B. M.
Red Cedar	354,702,000 feet B. M.
Spruce	74,676,000 feet B. M.
Hemlock	79,392,000 feet B. M.
Balsam Fir	1,260,000 feet B. M.
Yellow Pine	29,766,000 feet B. M.
White Pine	5,057,000 feet B. M.
Larch	38,597,000 feet B. M.
Yellow Cedar	30,000 feet B. M.
Jack-pine	6,914,000 feet B. M.
Cottonwood	1,045,000 feet B. M.
Alder	12,000 feet B. M.
Grand Total	1,017,683,000 feet B. M.

The average sale prices of standing timber by the Crown according to species during 1915, were as follows:—

Fir	$0.95 per M. feet
Cedar	1.05 per M. feet
Spruce	.71 per M. feet
Hemlock	.46 per M. feet
Balsam	.48 per M. feet
White pine	.77 per M. feet
Tamarack	.50 per M. feet
Other species	.50 per M. feet
Average price	$0.80 per M. feet

The distribution of saw and shingle mills in the province is shown in the report as follows:

West of the Cascades: 48 sawmills with daily capacity of over 40,000 feet; 48 sawmills with daily capacity of 15,000 to 40,000 feet, and 44 sawmills with daily capacity of 15,000 feet or less; 81 shingle mills. Total saw and shingle mills west of the Cascades, 221.

East of the Cascades: 27 sawmills with daily capacity of over 40,000 feet; 43 sawmills with daily capacity of 15,000 to 40,000 feet; 94 sawmills with daily capacity of 15,000 feet or less; 10 shingle mills. Total saw and shingle mills east of the Cascades, 174.

Total sawmills in the Province: 75 with daily capacity of over 40,000 feet; 91 with between 15,000 and 40,000 feet daily capacity, and 138 with a daily capacity of 15,000 feet or less; also 91 shingle mills.

Total Saw and Shingle Mills in the Province, 395.

The total number of logging operations in the Province amounted to 937, eleven more than in 1914. In all districts east of the Cascades, logging operations were greatly restricted throughout the year, and the increase is accounted for by the great activity in the Coast districts by small operations.

The Forest revenue for the twelve months up to December 1st, 1915, amounted to $1,992,558, a net decrease as compared with 1914 of $420,121. The decrease is accounted for by the severe depression experienced by the lumber industry, and the financial stringency which made the collection of revenue more difficult than usual.

During 1915 there were 1,031 forest fires reported by the Forest Fire Protection Staff. Of these, only 317 were classified as "cost fires." This is a considerable reduction as compared with the previous season when there were 639 "cost fires." The average cost of each "cost fire" was $61, whereas in 1914 the average cost was $219. About two-thirds of all fires originated on privately owned lands not classed as timber lands. The most prolific source of forest fires was carelessness by campers and travellers which accounted for 305 fires, or 29.6 per cent. of the total. 160 fires, or 15.5 per cent. are classified as of "unknown cause." Brush-burning accounted for 267 fires or 29.9 per cent. Railway operations were responsible for only 82 fires or 7.9 per cent. Lighting started 100 fires or 9.7 per cent. Railway construction was responsible for 17 fires or 1.7 per cent. 28 fires are classified as of incendiary origin being 2.7 per cent. of the total. Forest fires during the year covered an area of 30,310 acres as compared with 42,549 acres during 1914. They destroyed 144,220,000 feet of timber as compared with 102,804,000 feet B. M. during 1914. The damage during 1915 is estimated at $88,043, as compared with $52,852 during 1914.

Logging Costs in Pacific States Operations

The costs that are listed below represent a part of a general study of the lumber industry of the Pacific Northwest that is being made by the Department of Agriculture and Commerce in co-operation with United States lumbermen. The figures do not include the cost of stumpage, interest of any kind, discounts on logs sold, towage to mill, nor taxes on the standing timber. The average haul is 23 miles.

(Based on Figures from 20 Camps)

Output (1913) and Investment		
Percent of total output (approximate)		75
Average output per year per camp		45,000,000 ft. B. M.
Average output per day per camp		200,000 ft. B. M.
Average fixed investment		$140,000.00
Average working capital		35,000.00
Average labor cost per M board feet		3.09
Cost per M feet, Log Scale		
Felling and bucking, labor		$0.683
Woods to car, labor (yarding, loading, running line)		1.259
Railroad (spur) and pole construction, labor		.586
Train crews, labor		.206
Dumping and rafting (includes contract work)		.211
Supplies and maintenance (labor and materials) of R. R. dump and boom		.177
Supplies and maintenance (labor and materials) of equipment, tools, buildings, etc.		.307
Fuel of logging engines, locomotives, shops, etc.		.239
Wire rope		.137
Depreciation, equipment		.240
Depreciation, main line railroad grade, boom and buildings		.066
Scaling		.049
Return of boom sticks		.046
Log freight		.822
General Expense:		
Salaries and commissions	$ .139	
Taxes	.029	
Industrial insurance	.096	
Sundry expenses	.076	.340
Total average cost per M feet log scale		$5.428

Treated Wood Has Long Life

The National Railway Appliance Show held recently at Chicago had, as one of its chief educational features, a demonstration of why wood decays when used for paving, telegraph poles, railroad ties, structural timber or other such technical uses, with a comparison of the results secured from timber treated properly with preservatives and those not so treated. Woods in use for thirty years were shown which had been used under correct conditions, some of the old ties and poles being as sound now as when they were laid. The exhibit, which was arranged for the National Lumber Manufacturers' Association by the Southern Pine Association, was devoted entirely to this educational phase of the problem, showing engineers how wood can be made practically everlasting if it is properly used for construction work. Another part of the lumber exhibit was a model of a building actually erected in Chicago, of mill construction, timber frame, and floors throughout, as a demonstration of the engineering side of such construction. The most amazing phase of the exhibit was the explanation that a factory building of that type could be insured for 7 or 8 cents per $100, and that the cost of construction was only $1.29 per square foot.

In the cypress exhibit the features were the showing of lumber from old southern houses, still sound though erected in 1860. Tie and pole samples were also shown of the "wood everlasting."

In another corner of the coliseum was an exhibit of fir from the west, representing the Washington mills, which specialize in railroad and structural timber for railroads.

A coal and retail lumber dealer's section of the Retail Merchont's Association, of Regina, Sask., was formed at a recent meeting of those interested. The following officers were elected for the first year:—chairman, A. M. Fraser; vice chairman, T. B. Patton; secretary, W. R. McKenzie.

karri on the market. It is reported that the company will carry stocks in South Africa. Untreated karri has not been satisfactory .

The Railroad Department are prepared to buy a trial cargo of Douglas fir sleepers as soon as satisfactory evidence has been given of the service rendered by the timber elsewhere. Sample creosoted fir sleepers have already been placed in the track in South Africa.

Flooring, Ceiling and Dressed Lumber

The principal origins and the values of the dressed lumber imported during 1914 are shown here:—

Country	Value, 1914
Sweden	$103,372
Norway	37,047
Russia	11,380
Canada	7,195
Total	161,.98

The importations of flooring, ceiling and dressed lumber increased rapidly and regularly from $107,630 in 1909 to $289,041 in 1913. During this period the quantity imported from Canada remained negligible. No flooring or ceiling of any kind is produced from native woods in South Africa, and the requirements are certain to continue to be important.

(To be continued)

In the Public Eye

A budget of comment presented in the interest of public welfare, independent of party politics and with malice toward no one.

After eighteen months of silence "Industrial Canada," the mouthpiece of the Canadian Manufacturers' Association, has joined its voice to those of other journals that could not stomach what went on at Ottawa in connection with the letting of contracts for shells and fuses by the late Shell Committee. "Industrial Canada" tells us in its latest issue a few things it knows about fuse contracts and says that eighteen months ago the Canadian Manufacturers' Association went to the Government and tried to make it realize that the "license to loot" ought to be terminated. Their warnings, like those of many of the Government's political supporters were, according to "Industrial Canada" allowed to pass unheeded. So, at this late date, after giving the matter eighteen months of silent thought, the organ of the Canadian Manufacturers' Association, the members of which are both liberal and conservative comes into the lime-light with its statement of some of the things that have come under its notice.

* * *

I will outline the story told by "Industrial Canada" a little later on, after I have said what I feel about the part this mouthpiece of the manufacturers has been taking. While the making public of this story is better late than never, I cannot help wondering how such a journal can square itself with its own conscience for having kept silence all these months. It seems to me that this is just another example of the weakness exhibited by 90 per cent. of the journals of Canada in failing to do their plain duty. What is a public journal for, if it is not to tell the public some of the plain facts about its public men, especially when the good name of the country is being soiled? When the testing time comes, many of these journals lack the backbone, or the nerve to speak out. They act the part of Falstaff whose chief maxim was the comfortable idea that "discretion is the better part of valor" and they just keep mum. They wait until the burglar gets away with the swag, and finally, when so much has been filched from the public purse that no one can shut his eyes to it any longer, some of them join in the chase with a great hue and cry.

Why did not "Industrial Canada," in the interests of manufacturers, make its public protest eighteen months ago, when the trail was hot and there was some prospect of getting hold of the culprits before they cleared off with whole skins and a big swag? It was left to this paper—the Canada Lumberman—to make the first protest in the interests of the manufacturers of Canada, and in the interests of clean government and the good name of the people of Canada; and for some time it was left to us also to continue the protest almost alone. The Canadian Manufacturers' Association, through their organ "Industrial Canada" made their protest silently and without effect eighteen months ago. They should have followed this up at that time with a public statement, instead of waiting for eighteen months and watching the continuation of those evils about which they told the government in a whisper.

I do not relish the idea of saying much about my own doings, but I may be excused for pointing out such short-comings on the part of other journals, and saying, that in spite of my own loneliness all these months, I have felt and still feel that I have been doing the Canadian manufacturer and the Canadian public a real service in laying bare some of these ugly truths; a service which the public had a right to expect, the manufacturers especially, from those other journals, and more especially from their own industrial mouthpiece.

* * *

Here is the story of "Industrial Canada," told as briefly as we can put it:—Eighteen months ago the Canadian Manufacturers' Association approached the Government and told them some of the things they knew about the way in which fuse contracts were being given to Americans and refused to Canadians, and what people were saying about it all. "The reception given these suggestions," says Industrial Canada, "was not of a character calculated to invite further co-operation."

"There are limits," Industrial Canada continues, "to the patience of loyal citizens, even in war time, and much as we may deplore the disgrace that the fuse scandal has brought publicly home to Canada, and warmly as we may resent the effort to make political capital out of it at a time when our national energies ought all to be centred on winning the war, there is no getting away from the fact that the situation was intolerable, and that the license to loot had to be terminated."

After a little more in the way of an introduction, the article continues, saying that Mr. T. A. Russell and Mr. Lloyd Harris, of the Russell Motor Car Company Ltd., heard in April, 1915 that fuse contracts had been "going begging," since November 1914. Their first information about it "was received in New York from Sir Sam Hughes, who, by personal introduction referred them to Col. Allison in the Manhattan Hotel for details. Preferring to do business direct with the Shell Committee, Messrs. Russell and Harris went to Montreal and made overtures to the Committee through Gen. Bertram and Col. Carnegie." The up-shot of this business was that they were again referred to Col. Allison "who was said to have the matter in hand for prospective contractors in the United States." After considerable perseverance and several rebuffs, Messrs. Russell and Harris "were given a promise that one million of the five million fuses required would be held, pending the receipt of a tender from them, providing that tenders were submitted within a reasonable time." A reasonable time in their case "was defined as two weeks, notwithstanding the fact that Allison had presumably been busy on the proposition for five months without being able to offer anything definite."

Within the two weeks Messrs. Russell and Harris notified the Shell Committee that their proposition would be ready on the date specified. "And now for the fact that requires explanation," continues the article in Industrial Canada. "On May 25th, 1915, the Russell tender was turned in, offering to make 1,000,000 fuses at $4.20. On May 19, without waiting for this competitive tender, which was known to be on the way, and regardless of the promise given to hold at least a portion of the business open, the committee awarded contracts for the whole of the 5,000,000 fuses to the companies promoted by Allison and his associates, a small fraction of them at $4.00, but the majority of them at $4.50. The loss in money is a matter of easy calculation from the records of the committee. The loss in time of delivery is also determinable, because whereas the United States contractors have fallen far behind with their obligations, the Russell Motor Car Company, are now delivering ahead of time under a contract they subsequently secured at $3.70. The indirect loss to Canada and to the Empire through the sacrifice of domestic to foreign enterprise is beyond computation."

* * *

It is unnecessary to comment on this story at present. It simply adds a chapter to many that I have already published. Nor is it necessary to say much about the characters of the parties who are referred to as taking part in it. The fact that one of these parties is Mr. Lloyd Harris, stamps the story as deserving of every confidence. Mr. Lloyd Harris is one of the brightest and cleanest men we have in Canada today, and there are a good many others of his type. The thing that I cannot quite understand is why he, or others of his calibre were not employed by the government in this crisis. Can it be that he was too big a man for them? Whatever reply you give to this question, the Dominion Cabinet needs a good cleaning out, if the conservative party is to be saved from defeat.

* * *

Just by way of an example of the above idea, I may mention the case of Hon. A. E. Kemp, the chairman of the Purchasing Commission, who also has been acting Minister of Militia during the absence of Sir Sam Hughes. Is it in the interests of the people that a man who is so interested in companies selling goods to the Government should be occupying an important position on a Purchasing Commission? Is there no law against such things that can be made effective? Is there not even a sufficiently vigorous public opinion in Canada to teach such men that their positions as members of Parliament are positions of trust, to be exercised for the public welfare, not positions of profit to be utilized in their own interests? What do you think of a situation like this? Does it not make your blood boil, and make you question whether the men who get to the top of the tree in our political life are men of the large calibre they should be? In the name of Heaven, are there no big men in this country who could handle our affairs more after the manner in which we have every right to expect they should be handled?—SEARCHLIGHT.

Making Box Boards From Sawmill Waste

Conditions Under Which Residue From Lumber Production May Be Profitably Worked Up Into a Marketable Article

By P. L. Buttrick*

One of the most important subjects before the lumber trade is the disposal of "waste." In the days of low stumpage it did not greatly concern the lumbermen that they threw away about a third of the log in slabs, edgings and trimmings, which they burned to get rid of. As we look at it today, their operations lacked efficiency. Now that logs have become so much scarcer and stumpage so much more valuable, to say nothing of competition having become so much keener, they should take an interest in that mysterious thing called "efficiency." Efficiency means absence of waste. Yet it is impossible to cut round logs into rectangular boards without leaving a residue. This residue is called in sawmill parlance "waste."

It can, however, be used as a raw material for a number of wood products, not strictly classified as lumber. The more important of these are: lath, shingles, staves, box boards, wood pulp, and various chemical products such as turpentine and tannic acid. Nevertheless, with the exception of lath, most of these products are still made directly from logs or cordwood cut for the purpose, and the waste is still largely destroyed. This has not been altogether the fault of the lumberman, since it often cost so much to manufacture from waste that it could not profitably be done. Today increases in value and consumption of these products and the rise in value of the raw material are beginning to make it financially possible for those manufactured from waste to compete with those from logs and cordwood.

Efficiency demands that this be done, and it is an economic gain to the public as well as to the lumbermen that it be done, since the closer we utilize our timber the less we are obliged to cut at a time, and so the longer it will last.

Since the manufacture of box boards from waste is not a very well known scheme of utilization, it is possible that the following account, based on an experience of some months at a factory, which utilizes waste exclusively, may be of interest to lumbermen, foresters and conservationists.

The various products made from sawmill waste often demand quite different size, shape and quality of pieces, so that it is usually impossible, or at least unprofitable to utilize all waste from a given mill for a single product. Nevetheless, a box factory manufacturing a suitable grade of box boards should be able to utilize from 40 to 60 per cent. of the normal waste from the average mill (provided, of course, that it cuts woods suitable for box boards), and to leave a sufficient unsuitable remainder to stock the lath mill.

There are few kinds of wood which cannot be made into box boards, although some, such as cottonwood and White pine, are exceptionally desirable. Among the more common hardwoods which can be used are cottonwood, Yellow poplar, Red gum, tupelo, basswood, buckeye, chestnut, butternut and others. Among the softwoods are White pine, spruce, balsam, Southern and Western Yellow pines, Western hemlock and certain of the cedars.

Box factories generally use fairly high grade lumber, and have not taken kindly to the idea of using sawmill waste. Hence such work as has been done along this line has been by the sawmills themselves, some of which have successfully established box factories of their own.

There are four classes of sawmill waste which can be used in the manufacture of box boards, or "shooks" as they are often called. First, trimmings and edgings from the main sawmill; second, culls from the planing mill; third, odds and ends which accumulate about the plant and yard; fourth, slabs.

Trade customs which make it necessary that practically all lumber be cut into lengths which are multiples of even feet, and the necessity for trimming boards to rid them of wane or other defects insure a constant supply of boards too short for ordinary uses. These make excellent material for boxes. Edging strips are not so valuable, as they are apt to be too narrow, but heavy ones can be used. Every planing mill turns out a certain amount of finished lumber which is imperfectly manufactured. Boards with skips in dressing, or with a tongue or a groove split off, or perhaps with a strip of wane left on are examples of such culls. Many such boards cannot be manufactured profitably, but are suitable for box stock. Every mill has its quota of dead stock, such as boards spoiled in seasoning, odds and ends of special orders, badly sap-stained pieces and the like. A box factory can work up a great deal of such material and thus save it from becoming a total loss. Slabs are a perennial problem at the sawmill. By installing a slab resaw and cutting them into short boards for the box factory the waste from this source can be greatly lessened.

Equipment of the Box Factory

The manufacture of box boards requires extra floor space and special machinery. The shop can best be arranged in connection with the planing mill rather than the sawmill itself. If the plant is large, the box factory can be made a separate unit of management. At smaller plants its management can be incorporated with that of the planing mill. The main machinery in a box factory consists of rip-saws, cut-off saws, planing machines and resaws. Nailing machines, splicers, matchers, equalizers and many other special machines are used for various kinds of work, but are not essential in a factory using mill waste. A twin-band resaw, however, might be useful if trimmings from timbers and dimension stock are abundant. The planers must be specially designed for the work and should be wide gauge short-bed machines capable of running large numbers of short irregular pieces at high speed. Any standard resaw such as intended for planing mill or box factory use should be satisfactory. There are numerous types of cut-off and rip-saws designed for box factory use. Hand-feed rip-saws are probably more satisfactory for box factories using waste than are power-feed machines.

A good arrangement and combination of machines would seem to be the following: 1 band resaw, in front of 3 planers, then 2 more resaws, all followed by 6 cut-off saws arranged in a line at right angles to the resaws and planers, and then 7 rip-saws in a line at right angles to the cut-offs. Special machinery is usually placed beyond the rip-saws. (It is generally well to provide storage room both for waste and for completed shooks.)

Such a factory should be able to turn out from 50,000 to 80,000 feet of shooks a day, and to utilize waste from a mill of from 200,000 to 300,000 feet capacity. For a mill of from 50,000 to 100,000 feet daily capacity, a resaw, a planer, 2 cut-off and 3 rip-saws should be ample. The resaw could, perhaps, be used jointly with the planing mill, since it would generally be less in use in the box factory alone than the planer. Smaller mills can sometimes resaw slabs and planing mill culls and sell them to box factories to be worked into shooks.

Provision must be made for the collection of waste from various parts of the plant and its delivery at the box factory. In the main sawmill, the easiest plan is to pick out suitable pieces from the waste as it passes along the main refuse conveyor on its way to the refuse burner. It may be dropped on to trucks or wagons, or—if there is enough of it—on to a conveyor arranged to carry it to its destination. If the plant also has a lath mill, the box factory should be given first choice in working over the refuse, since box boards are a higher grade product than lath. There need be no fear of there not being enough pieces left too narrow for box boards with which to supply the lath mill.

Box shooks must generally be made of seasoned lumber, else they will warp; consequently it is necessary either to send the waste to a dry kiln or to pile it in the yard to season for several weeks. The dry kiln is better, since the cost of the extra handling of such small pieces increases rapidly. The edging strips are used for moulding stock. Such a car is estimated to contain 6,000 board feet.

Planing mill culls can easily be loaded on trucks and moved directly to the box factory, since they are usually already seasoned. Planing mill trim, if enough exists to make it worth while, can go in on a special conveyor. Occasionally a wagon or a trash car can be sent over the yard and the dead stock and trash which accumulates be loaded ino it and hauled to the factory. If a slab saw is installed in the main mill it is a simple matter to sort out all the short boards cut on it from the slabs and see that they reach the box shop.

Box boards used for tops, bottoms and sides are generally cut 5/16 or 3/8 inches thick. Ends and cleats are usually from 1/2 to 13/16 inches thick. It is generally possible to get 2 pieces for tops, bottoms, or sides from an inch board and 4 from a two-inch one. To obtain the required thicknesses, two-inch pieces are resawed, then planed and finally resawed again, since most shooks require dressing on one surface only. Inch boards are simply surfaced on two sides and then resawed, while pieces less than an inch in thickness are usually worked down entirely on the planers. Pieces of the required thickness for ends and cleats can sometimes be obtained directly from planing mill waste. For many uses it makes little difference if tongues or grooves remain on boards after they have been cut for box

* Consulting Forester, New Haven, Conn.

boards. This is more especially true in the case of rough crates where no attempt is made to remove them. After the boards have been reduced to the desired thickness they are cut to length on the cut-off saws and then ripped to width on the rip saws, imperfections being cut out in both processes. The completed shooks are then bundled in convenient numbers and shipped to their destination, where the boxes are built up from the different pieces. They are seldom assembled at the factory, since their bulk makes shipment in the completed form too expensive. Shooks are seldom cut in advance of orders, since nearly every customer has his own requirements as to dimensions and specifications.

Expensive Boxes Still a Problem

Expensive boxes calling for dovetailing corners, matched boards, sliding tops and the like have not so far been made commercially from sawmill waste. Until more experience and knowledge regarding the possibilities of this form of waste utilization has accumulated it is not likely that they will be. Small and medium sized packing boxes and crates do not require such expert knowledge or special machinery for their manufacture, and it is with them that box factories utilizing waste will specialize.

In manufacturing shooks from waste, great difficulty is experienced in securing enough wide stock. Narrow stock accumulates in abundance. Consequently, orders requiring wide boards such as one-piece sides, tops and bottoms for large and medium sized boxes are avoided. Nor are large boxes of any description considered desirable, since it is (or should be) difficult to obtain large pieces from waste. There is a large and steady demand for medium sized boxes for canned goods, tinned fish and meats, salt and frozen fish, soap, dried fruit, preserves, bottled liquors, cheap glassware, crockery and hundreds of other articles. Such boxes need not be made with special care or of very high grade material. They can easily and satisfactorily be made from sawmill waste.

Crates, which are made of narrow slats, are, however, the most desirable product for a box factory waste. Oftentimes the slats can be made from waste pieces at the same width they were originally cut, or if not, at such widths that there is little loss in ripping them. Sometimes the ends of these crates can be assembled on nailing machines in the factory before shipment. Such crates are used as containers for a variety of articles such as oil cans, syrup cans, empty bottles, pasteboard boxes, smoked meats, fruits, and light machinery.

There are in addition to shooks a number of other products which can easily be made from sawmill waste at a box factory. Stock for chair rungs, table legs and other wood turnery articles of a like nature, and for novelty uses of various kinds can be made of pieces too small or narrow for box boards. By installing a band or circular rip-saw, moulding strips may be sawed out of thick clear edging strips. Lumbermen seem to be agreed that there is no profit in making mouldings from stock boards. The use of edgings should yield a return.

Skilled Employees Scarce

The making of box shooks from sawmill waste is such a new enterprise that few men, either in box factories or sawmills, fully understand it. A box factory superintendent who has never used anything but standard lumber is apt to be out of sympathy with the idea of using waste. For this reason it may be better to place a man from the sawmill in charge, who is without previous prejudices, since in either case a man must be broken into the work. The same is true to a certain extent of rip-sawyers and other skilled workers.

The success of a box factory using waste depends to a large extent upon the run of orders. Orders for shooks of dimensions which cannot readily be obtained from waste may greatly increase the cost of manufacture, or make it necessary to use standard lumber to fill them. Except at very large plants, a box factory will not be of sufficient capacity to keep a special box salesman busy disposing of its output. Since lumber salesmen seldom have much knowledge of boxes or of the patterns which can be made from waste it is desirable that the superintendent have the power to refuse or cancel orders which it is not for the interest of the factory to accept. Mills with waste enough to manufacture only a small quantity of shooks might be able to make arrangements through regular box companies.

There is always the danger that the box factory will come to be regarded too much in the light of a catch-all, and material will be sent to it that could be more profitably utilized in other ways. There is no economy in sending mis-manufactured boards to the box factory if they can be remanufactured or trimmed without a loss of more than a third of their footage. Yet it is generally easier for the planing mill to send such material to the box factory than to deal with it themselves. Likewise, it is easier for the box factory to use such material than to use waste, hence it is not likely to protest. In the sawmill itself, the knowledge that heavy slabs and edgings and long trimmings will all be used in the box factory may encourage carelessness on the part of sawyers and others unless a sharp watch is kept. At the average mill which has no other way of utilizing waste, enough of it must necessarily accumulate to stock the box factory without permitting lax cutting to obtain it.

It should not cost more than from $10 to $12 per thousand feet of shooks to manufacture them from sawmill waste. The average selling price of a grade made from Southern Yellow pine is about $15. However, it will generally prove that shooks cannot be as cheaply manufactured from waste as from standard lumber—or at as great a profit. This need not dismay the lumberman who is cutting woods suitable for box manufacture, for ordinarily his waste is of no value and it is an expense to him to dispose of it, so if, by a small investment in labor and machinery, he can turn it to even a small profit, it is that much added to his income. As before remarked, the use of waste in this way is an advantage to the public, since the close utilization of our timber resources is the practice of conservation, and therefore an economic gain to all.

Logging and Saw Milling Machinery for India

A large proportion of the logging and sawing of timber in the Government forests in India is done by the Government Forest Department, which purchases the necessary machinery and carries on the work. It is felt by many forest officers that sufficient use has not been made of mechanical contrivances, especially in logging, and that greater profit would result from the working of the timber if such machinery were used in skidding and hauling logs as is done in Canada. Accordingly, Mr. H. R. MacMillan, Timber Trade Commissioner, has written the Department that the Forest Economist, India Forest Service, Dehra Dun, India, wishes to secure catalogues, descriptions and price lists from manufacturers in Canada of:—

1. Logging machines or steam skidders.—It is possible that the type of yarder or skidder now in use in Canada will be heavier than is necessary for Indian work. A machine is required for India that will yard 1,000 feet to a tram line in a stand of hardwood timber averaging about 6,000-10,000 feet per acre. Very few logs will weigh over 2,000 pounds, and it will probably be satisfactory to use skidders for the logs under 2,000 pounds and use elephants for the few heavier logs in order to keep the weight of the skidder to a minimum.

An important point to be noted is that as Indian timber is much more valuable than Canadian timber, teak for instance selling in the log at the depot for $60 per thousand board feet on a measurement that makes no allowance for slabs waste or saw-kerf, a larger expenditure is possible in logging than may be admitted in Canada.

2. Portable saw-mills.—A large number of portable saw-mills are used by the Indian Forest Department. The department is prepared to give Canadian portable mills a trial. Portable mills in India are used for manufacturing railway sleepers, small dimensions, lumber and pickets from low-grade logs. The power is supplied by a wood-burning traction engine, which hauls the mill. A very simple type of mill is required.

3. Logging tools and saws.—The Government has recently sanctioned the purchase of a further logging equipment, and Canadian manufacturers interested should take the matter up at once, particularly as, should a suitable type of machine be developed, a very wide market will be opened up both with the Government and with the several large companies now logging teak and other woods with elephants and bullock carts.

A report upon the timber trade of Italy published in a recent issue of the Weekly Bulletin of the Department of Trade and Commerce, shows that Italy's imports of timber, before the war, came chiefly from Austria-Hungary, the United States, Roumania and Russia, and amounted in an average year to three million cubic metres, one cubic metre being equal to 35.31 cubic feet. The national production of timber in Italy amounted to 500,000 cubic metres, bringing the total consumption up to 3,500,000 cubic metres. Canada had little or no share in Italy's timber trade. The report concludes with a statement that H. M. Consul at Milan, Italy, says:—"There is a ready market in Italy for timber, during the war, for Canadian exporters who are in a position to take advantage of the opportunities now offering. Even should Italy, subsequent to the war, resume her imports of timber from Austria, there should still be a market in Italy for North American timber even in times of peace, as is evidenced in the fact that the United States exported 153,800 tons of sawn timber to Italy (about 12½ per cent. of the total imports of sawn timber." H. M. Consul at Milan also states that he would be pleased to attend to any inquiries addressed to him re this subject from Canadian firms. (A list of Italian timber importers and merchants, with their addresses, has also come to hand, which may be had on application to the Department of Trade and Commerce, Ottawa.

B. C. Timber Inspector Geo. D. McKay returned recently from an inspection trip up the coast of British Columbia and reports that all the logging companies are now back at work, and every boat is filled with loggers.

Trade Conditions in New Brunswick

Favorable Logging Season Just Closed—Possibility of Water Shortage for Driving

Editor Canada Lumberman: South Nelson, N.B., April 3rd.

In this remote corner of the Dominion there is not much of general interest so far as the lumber business is concerned to write about.

The Miramichi, although producing a large quantity of lumber each year, is very conservative in its operations and pursues the even tenor of its way year by year without much variation.

The logging season just closed has been a favorable one for the operator. fair weather and just enough snow for hauling favored the cutting and browing of logs, and as a result the quantity produced will be somewhat more than was expected. The spring has burst very suddenly upon us and already the snow outside the forests has almost disappeared. It is very unusual for the snow to go so rapidly. However pleasant and agreeable this may be for the ordinary citizen, it is causing considerable worry to those who are dependent on a good rush of water to bring their logs from the brows to market.

We are now making preparations for spring driving, which usually begins about the last of the present month (but which, judging by the present weather conditions, will begin earlier this year) the outlook for which, owing to the rapid melting of the snow, is not very encouraging.

Conditions surrounding the lumber industry in this section during the present season are in a rather uncertain condition. The great bulk of lumber produced on this river finds its market in Great Britain and the Continent. Owing to the great scarcity of vessels lumber freights have advanced to such an extent as to be almost prohibitive; in fact it is almost impossible to secure vessels. As an illustration of the situation it may be pointed out that while the normal fair rate of freight from this river to British ports is from 40 shillings to 50 shillings, this season 300 shillings has been paid and in one instance at least refused. The lumber is required on the other side. Stocks there are not excessive and buyers are willing to pay good prices if they could move it, but naturally hesitate about entering into obligations which they cannot see their way clear to carry out. What the outcome will be no one can foresee. When the mills begin sawing in a few weeks, manufactured stocks will rapidly accumulate, and as piling ground is rather limited, unless some solution of the transportation difficulty is found, it will be quite a problem to take care of the lumber unless perchance the prognostication of the pessimist comes true and the logs are held up in the stream by low water.

Such is the situation here today, and it illustrates one of the many ways in which the deplorable conditions in Europe are brought home to us.

We are living in hopes that some way may soon be found to relieve the situation so far as transportation is concerned.—Geo. Burchill and Sons.

Nova Scotia Output About Normal

Editor Canada Lumberman:— Halifax, N. S., April 6th.

As far as this district is concerned, we are all kept busy, with Government requirements chiefly. Tonnage is very scarce, and it is going to be almost impossible to get vessels to move the output this coming season. This alone should help the market to keep up. The output in Nova Scotia will be well up to the usual average, as we had excellent weather conditions right up to the last of March, which enabled the operators to get out larger quantities than they figured on. This will offset the fact that a number of the lumbermen did not go in until the first of the year. As both sailing vessels and steamers are so scarce, a large quantity of lumber will not be shipped this season, and this will, of course, mean that considerable financing will have to be done.—Colin C. Tyrer Company, Limited.

The Nicola Valley Pine Lumber Company report that their mills at Canford, B. C., will be exceptionally busy this season, having many orders on hand for large dimension timber. A night shift will be put on almost immediately, and the mill will probably be kept running night and day during the next six months. Arrangements have been made to cut about 20,000.000 feet.

Pacific Coast Exports During 1915

The North Pacific cargo trade in lumber for the year 1915 totals 1,410,637,401 feet. For 1914 it was 1,693,621,192 feet. For 1913 the cargo trade amounted to 1,934,835,725 feet.

The net 1915 loss on this branch of the trade was 282,983,791 feet. As compared with the year before the war, the last normal year in the lumber business, the loss represents 524,198,324 feet.

The figures include the annual shipments from tidewater mills of Washington, Oregon and British Columbia. They were compiled by F. W. Alexander, secretary of the Pacific Lumber Inspection Bureau, Seattle.

Foreign business for the year of 1915 was 337,235,131 feet, as compared with 508,606,327 feet for 1914—a loss of 171,371,196 feet. In 1913 the foreign business from North Pacific mills amounted to 600,142,246 feet.

The comparative figures of foreign distribution for the years 1915 and 1914 follow:

	1915 Lumber, ft.	1914 Lumber, ft.
Australia	107,240,340	192,753,406
New Zealand	5,528,105	12,843,774
West Coast South America	32,685,447	79,445,282
East Coast South America	.....	7.945.010
Mexico	6,466,437	5,324,474
Central America	690,402	104.703
China	46,249,201	124,934,363
Japan	7,451,959	10,936,136
South Sea Islands	4,279,768	11,441,376
United Kingdom and Continent	108,100,364	35,614,850
Africa	9,294,793	12,566,188
India	8,481,881	14,696,765
Cuba	766,434	.....
Total foreign	337,235,131	508,606,327

Loss, 171,371,196 feet.

The summary of shipments by districts for 1915 alone shows the loadings comprising the year's total business to have been as follows:

	1915 Domestic Lumber, ft.	1915 Foreign Lumber, ft.	Total Lumber, ft.
British Columbia	12,710,400	56,700,835	69,411,235
Puget Sound	297,725,552	149,389,327	447,114,879
Grays Harbor	220,763,547	50,221,743	270,985,290
Willapa Harbor	56,751,774	6,987,032	63,738,806
Columbia River	267,897,962	73,879,902	341,777,864
Coos Bay and Oregon Coast	217,553,035	56,292	217,609,327
Total	1,073,402,270	337,235,131	1,410,637,401

Gains and losses by shipping districts contained in the tabulation which follows shows that British Columbia shipped more lumber by 27,932,815 feet than in 1914, but the total of British Columbia water business, notwithstanding this gain, was very small as compared with the water business of the mills of Oregon and Washington. The details are:

	Lumber, ft. 1915	Lumber, ft. 1914	Lumber, ft. Gain or Loss
British Columbia	69,411,235	41,478,420	*27,932,815
Washington	816,182,138	959,289,510	143,107,372
Oregon	525,044,028	692,853,262	167,809,234
Total	1,410,637,401	1,693,621,192	

*Indicates gain.

British Columbia's domestic cargo trade during 1915 was as follows:

	Lumber, ft.	Lath, ft.
Atlantic Coast	6,063,599	397,498
Eastern Canada	4,875,365	.....
California (San Francisco)	1,373,938	.....
Total	12,312,902	397,498

The total domestic cargo trade of British Columbia, Washington and Oregon was as follows:

Lumber	1,047,376,515 ft.
Lath	25,885,347 ft.
Pickets	140,408 ft.
Total	1,073,402,270 ft.
British Columbia	12,710,400 ft.
Washington	607,254,611 ft.
Oregon	453,437,259 ft.
Total	1,073,402,270 ft.

The foreign cargo business from British Columbia was distributed as follows:

	Lumber, ft.	Lath, ft.	Pickets, ft.
Australia	4,696,109	560,085	656,826
New Zealand	542,521	98,056	.....
West Coast South America	301,449	.....	.....
Mexico	.....	.....	.....
China	3,377,453	48,500	.....
Japan	1,583,437	.....	.....
South Sea Islands	1,392,808	.....	2,250
United Kingdom and Continent	37,976,309	135,990	.....
Africa	5,329,042	.....	.....
Total	55,199,128	842,631	659,076

The total foreign cargo business of British Columbia, Washington and Oregon was as follows:

Lumber	331,851,421 ft.
Lath	3,510,550 ft.
Pickets	1,873,160 ft.
Total	337,235,131 ft.
British Columbia	56,700,835 ft.
Washington	208,927,527 ft.
Oregon	71,606,769 ft.
Foreign total	337,235,131 ft.
Total domestic	1,073,402,270 ft.
Total foreign	337,235,131 ft.
Grand total	1,410,637,401 ft.

Self Feed Rip Saw in the Furniture Factory

By W. J. Beattie

Since the general introduction of the self-feed rip-saw into the machine equipment of the factory, the capacity for lumber consumption and the cheapening of that portion of the work has been greatly increased. The style generally in use is the circular saw type, the later idea being to have the saw above the table, supplemented by an endless chain feed. This idea seems to be an improvement on the older style, one decided advantage being that the saw cuts through the material, thus reducing friction to quite an extent.

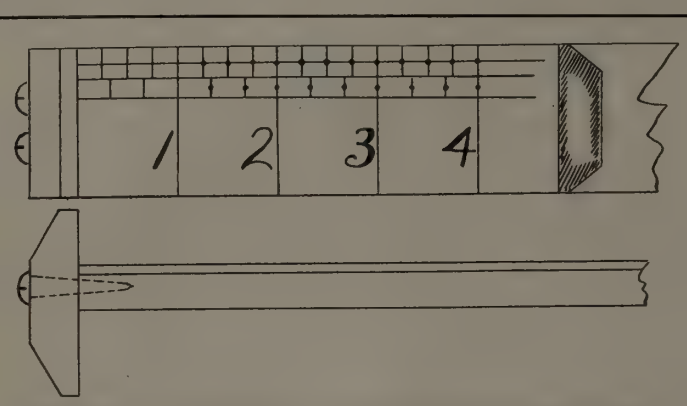
The band rip-saw for larger factories, where the necessary equipment and help to keep the saw in order are available, is doubtless the better tool, as the lesser waste of material, combined with greater speed, are strong points in their favor.

There are still some plants that cling to the old style railroad rip-saw for use in matching up tops or large surfaces, especially on quartered oak goods, in many cases carefully matching up the material, which may consist of six or more pieces, laying the whole lot on the table and shoving them through the saw, cutting off the surplus from the edge.

This is a slow and laborious method, and can just as well be done on a self-feed machine with a great saving of labor.

Assuming that the light is good, and it certainly should be, the matching up can be done on a table behind the rip saw, and the one piece only that requires ripping is passed back and sawn to the necessary width. Of course, it is understood that the stock has already had the necessary edging done to it after leaving the swing saw.

The expert matcher is behind the saw in this case, and not in front of it, and sorts the material for figure as it comes to him, on a table of the required size, which can be made several inches lower than the saw table, and so placed that it is in the handiest position. A rule, such as is illustrated, will be found very handy for this work, made of maple of the necessary length; the inches are divided into quarters and thirds, which will correspond with the allowance required for each joint. For instance, if the tops are 46 inches long and 20 inches wide, finished width, and there are four joints, the width



Rule used to make allowance for joints when ripping stock.

when leaving the matching table will be 27¼ inches, which allows 1 inch for the four joints plus ¼ inch for buzzing the one edge and the final ripping to exact width.

For longer stock the larger divisions of the inch would likely be necessary; it all depends on the accuracy of the rip saw and the minimum allowance for the jointer. At any rate it is possible to have only the same amount of final ripping waste from a top having as many as six or seven joints as one having only three, if the proper allowance is made for each joint. The maple rule referred to is just as feasible for work that is not matched for figure. The material goes through the saw and is laid on the table until it is within a few inches of the desired width. The "tailer" can then tell just what he wants to complete the requirement in inches and it is immediately delivered to him and the material placed on the truck. The same thing goes on until that size and quantity is completed.

Another help in this connection is to have the rule bored at the line intersections, into which are inserted small steel pins which correspond with the number of joints that may be necessary. If the top is to finish 20 inches wide the first pin would be inserted at the 20¼ in. measurement, the next ¼ in. more, etc., the idea being that it is easier to count the pins corresponding to the joints than if they were not used.

It will be found handier to have, say, three rules made of various lengths, to use according to the material requirements of the factory. In making a rule secure a piece of white maple 1½ in. wide, 7/16 in. thick, bevelled on the under corners, having a stop on the left end facing; lay off the inches and divisions with a knife, bore the small holes for the pins, give a coat or two of white shellac, sand, ink on the figures; then give a coat of good tough varnish, and you will have a good bright serviceable article, and one that will be found of great help in the rip saw work. The accompanying illustration will give an idea of the rule referred to. The figures necessarily begin at one inch, though this is not needed, particularly, at least so far as the divisions of the inches are concerned.

Consumption of Wood Flour

More than twenty thousand tons of wood flour, valued at $300,000, are used annually in the United States in two widely different industries, the manufacture of dynamite and the manufacture of inlaid linoleum.

Wood flour is also used in making composition flooring, oatmeal paper, and in several other industries. It forms one of the means by which the huge waste product of our lumber mills is beginning to find some better means of disposal than the burner. Since a total of 36,000,000 cords of such waste is produced each year at sawmills in the United States, of which about one-half goes into the furnace as fuel, while the rest is burned as refuse to get rid of it, there is no lack of raw material for industries which can develop ways of turning this waste to account.

All wood flour-using industries require a white or very light cream-colored flour having good absorptive powers. The wood species that may be used are confined to the light, non-resinous conifers, and the white broadleaved woods like poplar, Spruce, white pine and poplar are the species most used. Mill waste, free from bark, furnishes much of the raw material for making wood flour.

For use in dynamite, the trade demands are said to require a white wood flour, since the freshness of dynamite stock is indicated by a light color. Dynamite flour must also be very absorptive, so there will be no leakage of nitroglycerine from the finished product. Wheat flour mill refuse and infusorial earth have also been used in dynamite making, but wood flour has practically replaced them in this country.

In the manufacture of linoleum, either wood or cork flour is used. The flour is mixed with a cementing material, spread out on burlap and rolled or pressed to a uniform thickness. The cement is the expensive constituent. Cork linoleum is the cheaper because less cement is necessary. The patterns are printed on, leaving a dark base. For inlaid or straight-line linoleum, wood flour is used exclusively. Cork linoleum is always dark, and slightly more elastic than that produced from wood flour. The wearing qualities are about the same.

Two methods of producing wood flour are practiced; one using millstones, the other steel burr rollers to pulverize the wood. The latter requires only one-fourth as much power to operate as the former and was developed on the Pacific Coast to handle sawdust as a raw material. The mills of Norway, which produce much of the European wood flour, are of the stone type.

Wood flour mills are scattered over the United States from Maine to California wherever the proper combination of wood and water power is available, and the domestic wood flour competes with the Norwegian product, which, before the European war, was delivered at Atlantic ports for $12.50 to $15 per ton.

Eastern Trade Conditions

A report from Sackville, N. B., states that 310 shillings per standard has recently been paid for freight charges on a cargo of lumber from Sackville to the west coast of England; almost ten times the rate that existed before the war began. Even at this price very few vessels are obtainable and exporters are experiencing much difficulty in making shipment. Imports at Liverpool during the month of February amounted to only 980 standards, against 3,370 standards during the corresponding month in 1915.

In the American market, while no active business has taken place as yet, there are prospects of marked activity later on. Inquiries from New York indicate that buyers there are willing to pay about $19 to $21 per M. for hemlock and $22 to $24 for spruce delivered New York. With freights at $6 to $6.50 per M. this business is not as attractive as it would be in normal times. However, it is probably still all right from the profit standpoint and if our lumbermen can get the tonnage necessary there will be an active business with New York during the coming summer. The logging conditions in the province of Nova Scotia for the past month have been almost ideal; and if the markets warrant it the cut of lumber this year should be a large one.

The exports to Canada of yellow pine during the past three years as shown in a report compiled by J. S. Barstow, Mobile, Ala., were as follows:—1915, lumber 1 x 3 in. and larger, 930,872 superficial feet; sawn lumber 6 x 6 in. and larger, 1,651,577 superficial feet; 1914, lumber 1 x 3 in. and larger, 4,059,000 superficial feet; sawn lumber 6 x 6 in. and larger 14,375,165 superficial feet; 1913, lumber 1 x 3 in. and larger, 3,339,424 superficial feet, sawn lumber 6 x 6 in. and larger 18,230,277 superficial feet.

Should Estimating Be Charged For?

By J. Crow Taylor

One of the questions being discussed more or less seriously among retailers these days is that of whether or not a charge should be made for furnishing estimates to contractors and others, to cover the actual cost on this work.

The question is undoubtedly inspired by the fact that many an embryo contractor uses the lumberman as a sort of good thing and works out of the lumberman a lot of details of estimating that he should work out himself.

The writer has known of contractors virtually getting their training in the work of estimating by the bringing of rough plans to a local lumberman and getting him to list off the stuff required and make an estimate on it. Time and time again work of this kind is brought to the local retail lumberman and there is perhaps not one in ten that result in actual orders. Moreover the retailer generally knows that his chances are slim to get an order, yet because the contractor is a prospective customer he must treat him well and accommodate him to the extent of listing off plans sometimes and making up estimates that involve quite a lot of detailed work and also put on the shoulders of the lumberman some responsibility that should be carried by the contractor. If an error is made or an item is left out and the lumberman has done the listing off it will be but natural for the contractor to hold the lumberman to it and make him make the error good.

Indeed the writer knows of specific cases of this kind where even some slight changes have been made or an error has developed where the lumber yard, for accommodation, has listed off and done the figuring for a contractor and then the contractor has insisted on the lumberman standing the loss instead of the contractor.

Adds to the Burden of the Work

Another thing that adds to the work of the estimating end is the disposition now to be more thorough, to go into details and furnish the prospective builder, that is the owner, with complete figures of what it will cost to build a house, making the figures cover even work and material that will not be supplied by the lumberman. The idea in all this is that it helps salesmanship, that the progressive lumberman is the one who will take this trouble as a proposition in giving service to the people of the community. The mail order houses do it, so naturally the local man must do something of the kind or be considered a sort of back number in the selling game.

That is not all either. There are some of the larger concerns operating planing mills in connection with their lumber yards who say that for the sake of reducing errors they find it best to reduce all details to plans and blue prints and cover them with specifications that become a part of the bargain or contract. This not only reduces the chance for error in the mill and on the yard, but it also reduces the chance for misunderstanding between the lumberman and the man buying the bill for the house.

All this adds more and more to the burden of detailed work in the estimating department of the lumber yard and there is no getting around the fact that it costs money. It should be paid for and must be paid for, but it will be much easier and more logical to make a specific charge for delivery than it would be to make a charge for estimating. The estimating is regarded as a part of the work of salesmanship even though it does belong in the order of service, consequently it would be more logical to charge for delivery—which is nothing more than a matter of service—than it would to charge for estimating, which is a matter of salesmanship as well as service.

Customer Can't See It

There is no good argument therefore to make a specific charge for furnishing estimates, at least, as far as the owner customer is concerned. It might be practical to have some agreement between the lumber yards and the contractors as to the matter of plans and specifications so that in case a lumber yard goes to considerable detail in making blue prints, specifications and estimates it can be reimbursed for it in case the plans are accepted and used and the order for the lumber material is given to some one else.

Even this, however, leaves room for disputes and for wrangles and dissatisfaction and it is better all around to make the estimating department a live wire service department absolutely free to all customers and then figure the cost of this in the overhead expense of running the business so that there will in the final estimate be some compensation for its service.

One, of course, may use some judgment now and then about rendering too much free service for contractors and others who take an unfair advantage of this service and seldom buy anything, or at least not enough to justify it. Even there, however, it is better to be imposed upon a little than to take the chances of offending or of creating the impression that one is stingy about rendering service.

What the retail yard man needs and should work for is a reputation for giving service and gladly furnishing prices and showing goods so that people can be induced to come to his office when they want anything from a chicken coop to a home. Getting the people to come to one to find out about things is the best first aid to good business one can have. There is no better drawing card to this end either than a reputation for freely furnishing without charge estimates on anything in the way of building lumber from a few pieces to do some patching to an entire list required for building a new home. So let us not have any growling, to the public at least, about this end of the business, but rather give out the impression that it is free and freely given.

How Much to Spend in Advertising

The retail lumber dealers all over the country have come to a realization that there is need for more activity in the way of advertising. Also nearly every enterprising retailer is taking up with the idea of doing some advertising. The main question right now bothering most of the dealers is; how much should be spent in advertising?

There is, of course, the companion question of how to spend and where? There is the question of how much space to buy in the local newspaper and how to use it, how much to spend for circulars, for window displays and things of that kind.

In a few branches of trade they have reduced this advertising appropriation down to a more or less positive basis. The furniture retailers, for example, figure on spending from 3 to 5 per cent. of the gross sales in advertising. Department stores spend about the same amount; sometimes other stores spend more and sometimes less.

It is very natural to argue that some lines call for a larger percentage of advertising appropriation than others. If so, the question might well be asked why, for example, should furniture stores spend more money advertising furniture than the lumberman should spend advertising his product? Indeed it looks like the furniture stores are setting a pretty good example for the lumberman and that the retailer cannot do much better than try the experiment of spending the same percentage of his gross sales in advertising as is spent by enterprising furniture stores.

Why not try the experiment of taking your gross sales for last year as a basis and figure on spending a sum equal to 3 per cent. of that amount during the present year and note the results. If they prove satisfactory, then it might be well to try raising the same to 5 per cent.

Providing for the Fund

With a yard doing comparatively small business, say selling $50,000 worth in a year, figuring on a basis of 3 per cent. of gross sales, would give an advertising fund of $1,500, while, on a basis of 5 per cent. the sum would be $2,500.

The average lumberman will look at this as a big sum of money to simply experiment with in advertising. It is a big sum, too, if it is to be wasted or spent without returns, but the right idea in advertising is to spend the money so that it will bring in more.

During one of the many retail conventions this winter one man in a country town told of spending between $200 and $300 and practically doubling the volume of his business. He said the advertising was not the whole thing but it was an important factor. They did quite a lot of personal hustling and conditions in their community were such as to encourage the development of more business, but just the same he felt that they had obtained excellent returns for their advertising.

Another man told of spending approximately $2,000 a year, mostly newspaper advertising, and he said he felt that this had increased the volume of their business 50 per cent. and had been money well invested.

The question right now, however, is not one of whether or not advertising pays. This has been pretty thoroughly demonstrated. There is not much disposition to argue against the assertion that advertising intelligently handled will bring results.

May Prefer Lumping It

Some may prefer to make it a lump sum of anywhere from $1,000 to $10,000. The amount will depend upon the magnitude of the business, the location, the cost of space in the local papers and the opportunities for effective exploitation by making window displays, using billboards and other means of exploitation.

Whatever amount be spent, every man should keep a careful record of it. Properly everything that assists in exploitation or publicity of business is chargeable to the advertising account, everything from writing letters to buying space in newspapers. Keep careful track of it all so that you may know the total at the end of the year and also may be in a position to compare this total with the total volume of business.

There is undoubtedly a logical reason for establishing a relation between the volume of sales and the amount spent for advertising. This is not the only factor entering, neither should it be strictly arbitrary, but it is well enough to use something of this kind as a sort of working basis, and from the successful accomplishment of others the evidence seems to be in favor of spending from 3 to 5 per cent. of the gross sales for advertising purposes.—St. Louis Lumberman.

Annual Consumption of Wood by the Wood-Manufacturing Industries in the United States

Statistics have been compiled by the Office of Industrial Investigations of the United States Forest Service which show for the first time precisely how the lumber produced in the country is utilized. About forty-five billion feet of lumber of all kinds is the maximum annual production in the United States; of this, nearly twenty-five billion feet, board measure, are further manufactured, the other portion being used for construction lumber and timber and for similar purposes. This is exclusive of that material which reaches its final use in the form of lath, shingles, fuel, railroad ties, posts and rails, poles and equipment, pulpwood, cooperage, veneer, wood distillates, and the wood demanded by the tanning industry.

The first of the accompanying tables lists the industries included in the investigation and gives the quantity of material demanded in a single year by each of them. The quantity of each kind of wood received as raw material by shops and factories and converted by further manufacture into finished and salable articles is shown in the second table.

Between 50 and 60 per cent. of the lumber produced is subject to further manufacture. However, it should be remembered that considerable material reaches shops and factories in the form of logs, bolts, and billets, without having passed through sawmills, and such material is included in these statistics. This fact should be remembered in comparing the statistics with those of lumber production.

The table which follows lists the 55 wood-manufacturing industries which use wood as raw material and gives the annual demand by each of them.

Wood Used by Wood-Manufacturing Industries of United States

Industry	Quantity Used in One Year Feet B. M.
Planing mill products, sash, doors, and general millwork	13,428,862,066
Boxes and crates	4,547,973,180
Car construction	1,262,090,371
Furniture	944,677,807
Vehicles and vehicle parts	739,124,483
Woodenware and novelties, and dairymen's, poulterers' and apiarists' supplies	405,286,436
Agricultural implements	321,239,336
Chairs and chair stock	289,790,560
Handles	280,234,571
Musical instruments	260,195,026
Tanks and silos	225,617,686
Ship and boat building	199,598,228
Fixtures	187,132,848
Caskets and coffins	153,394,557
Refrigerators and kitchen cabinets	137,616,266
Excelsior	100,247,000
Matches and toothpicks	85,442,111
Laundry appliances	79,502,040
Shade and map rollers	79,291,575
Paving material and conduits	76,067,000
Trunks and valises	74,669,997
Machine construction	69,459,430
Boot and shoe findings	66,240,200
Frames and moulding, picture	65,477,783
Shuttles, spools, and bobbins	65,148,190
Tobacco boxes	63,154,226
Sewing machines	59,946,527
Pumps and wood pipe	55,826,938
Pulleys and conveyors	35,862,900
Professional and scientific instruments	35,070,928
Toys	28,926,552
Gates and fencing	27,450,540
Sporting and athletic goods	25,191,907
Patterns and flasks	24,299,403
Bungs and faucets	21,112,342
Plumbers' woodwork	20,313,450
Electrical machinery and apparatus	18,188,910
Mine equipment	16,987,697
Brushes	12,878,986
Dowels	11,980,500
Elevators	10,018,680
Saddles and harness	9,218,000
Playground equipment	9,064,812
Butchers' blocks and skewers	8,197,050
Clocks	7,894,249
Signs and supplies	6,888,366
Printing material	5,324,794
Weighing apparatus	5,021,550
Whips, canes, and umbrella sticks	4,946,880
Brooms and carpet sweepers	2,297,334
Firearms	2,093,901
Artificial limbs	687,080
Tobacco pipes	489,515
Aeroplanes	74,300
Dry kilns	59,000
Total for wood-manufacturing industries	24,673,846,064
General construction and building	19,835,914,936
Maximum annual lumber cut	44,509,761,000

French Market for White Spruce

Mr. Philippe Roy has forwarded the Department a sample of white spruce submitted by a French firm who are in the market for 5,000 metres of lumber (similar in quality to sample) to be used in the construction of flying machines. The lumber is of very high quality, no other grade being acceptable. Mr. Roy states that this firm is disposed to purchase f.o.b. Canadian port if it is not possible for Canadian producers to quote c.i.f. French port. It is also intimated that the Engineering Branch of the War Department would be disposed to purchase a fairly large quantity of this same quality of lumber provided the price is satisfactory. The sample referred to may be seen at the Department of Trade and Commerce, Ottawa, and the name and address of the firm in question obtained on application. (Refer File No. A-239.)

Market for Douglas Fir in India

Mr. H. R. MacMillan, Special Canadian Trade Commissioner, states that a Bombay lumber house is very desirous of opening up connections with a suitable firm of exporters of Douglas fir. They would prefer to deal with a firm of brokers rather than with sawmills. This firm, who wish to be put in touch with Canadian sources of supply, are important importers, and do a great deal of railroad and government business throughout India. Financial references can be given and an inquirer may secure information as to their financial standing from the National Bank of India. Canadians who may be interested in exporting timber to this market may obtain the name and address of the firm in question by applying to the Department of Trade and Commerce, Ottawa. (Refer File No. A-1499).

The Wooden Handle Trade

There is little likelihood that any substitute will ever take the place of wood for certain kinds of handles. Those which require elasticity and resiliency will continue to demand wood, while others of certain kinds may be made of metal, composition of rubber. More wood is yearly consumed in the manufacture of handles than for musical instruments. The annual total exceeds 280,000,000 feet in the United States. The builders of ships and boats do not take so much.

The kinds of handles are too numerous to be shown in any list, but they may be included in general classes. Sizes range from that for a button-hook a quarter of an inch thick and two inches long to the cant hook handle five feet long and three inches thick. Some of greater length are employed for farm tools like pitchforks and rakes; and if knobs for small drawers and cabinet doors; may be regarded as handles, some are of smaller sizes than those of buttonhooks.

All handles are not required to be of strong, tough woods, though many are. Some, like the ax and hammer handle and the pitchfork handle must stand excessive strains and violent jars and twists. Wood for handles of that kind must be carefully selected. Hickory is by common consent the best ax handle wood obtainable. A few woods are stronger than hickory and some are stiffer; but when strength, toughness, elasticity, and smoothness of grain are combined, no other wood eqauls hickory. It is sought for the best ax, hammer, and golf club handles. No other wood can stand so much bending, twisting, and jolting without being broken of permanently distorted. Though hickory is found growing in commercial quantities in only about half the states, its use as handles is listed in all the states.

The long handles of farm tools are of ash oftener than of any other wood. Ash is very stiff and is quite strong and is preferred for forks, shovels, rakes, and hoes. Several species of ash grow in the American forests; but that preferred for handles is white ash, which is more abundant than all other species of ash combined, and is found in trees of larger size than the others. Most of the species of ash are named from the color of wood, bark, bloom, or twigs, as white, black, red, green, and blue ash. Only the woods of white and black ash are customarily distinguished in the handle trade, but even there the difference is not always noted.

Short handles of various kinds are made of different hardwoods, such as maple, birch, beech, and oak. Handles for augers, small hammers, monkey wrenches, large knives, hatchets, and numerous tools for carpenters, smiths, and other artisans are in this class. Rather severe strains and shocks must be withstood, but short handles of this class are not put to the violent tests which the long hickory and ash handles of axes, hammers and farm tools must endure.

Immense numbers of small softwood handles are produced by factories. In this list are those for buckets, tubs, and packages. They are finished in different styles. Some are left natural, some are polished and stained, others are enameled. The woods of which they are made are pine, spruce, cedar, and fir. Handles of a similar kind are made of basswood, red gum, yellow poplar, beech, birch, maple, tupelo, and cottonwood. There are few woods which do not give

good service when manufactured into handles of this kind. The demand is large and the industry is extensive.

The makers of knife handles use some common and cheap woods and others of finer kinds and of high cost. Handles for butcher knives are often of beech or red gum, and may be in two parts with the knife shank riveted between them, or in one piece. Expensive foreign woods are preferred for handles of pocket knives. The thin pieces of wood for that purpose are known as "knife scales," and the quantity of wood required for a handle of that kind is small.

New York may be taken as a representative handle state, although some other states use much more wood in this industry. Ohio, for example, consumes nearly five times as much wood as New York in the production of handles, and Arkansas six times as much; but the variety of handle woods in New York is greater. The following list gives the woods and the quantity of each required annually by handle makers in New York:

Handle Woods Used Yearly in New York

Wood	Feet B.M.	Average Cost per 1000 Feet
Beech	3,076,000	$ 17.80
Sugar maple	1,418,000	18.50
Birch	861,000	13.70
Ash	466,400	29.90
White oak	336,500	40.59
Hickory	204,150	39.57
Basswood	37,000	24.32
Elm	30,000	18.00
Applewood	22,000	68.50
Silver maple	10,000	15.00
White pine	10,000	32.00
Lignum-vitae	1,500	250.00
Grandillo	685	113.87
Ebony	654	330.00
Rosewood	610	130.00
Cocobola	480	160.00
Total	6,474,979	$ 20.52

Although Ohio handle makers report no wood of higher cost than $31.24, the average cost in that state is $27.65, which is $7.13 more than the average for New York where five of the woods cost more than $100 per thousand feet. Ash leads in quantity in Ohio, beech in New York. Five foreign woods are used by handle makers in New York; not one in Ohio.

Waste in Lumber Due to Drying

Manufacturers who know admit that there is a waste of 30 to 35 per cent. due to improper methods of handling the lumber in drying. When not properly piled for air-drying, the overhanging boards check, twist and bend; stickers of uneven thickness and when not placed directly over each other, cause twisting and bending. The lack of knowledge of proper means for kiln-drying cause twisted, checked, warped and honey-combed lumber. When this lumber reaches the saw the defects removed as waste reach the large percentage mentioned above. Most of this waste could be prevented by properly handling in the yard.

Interesting details of the work of the Forests Products Laboratories were given by Mr. J. A. Coderre, forestry engineer of the Laboratories, at a meeting of the Montreal Chambre de Commerce on April 5. Mr. Coderre spoke of the desire of those in charge of the laboratories to give every information possible concerning the uses and qualities of all descriptions of lumber, and also what treatment will make woods already in use better for the purposes for which they are suited. Experiments were being made with a view to substitute Canadian woods for those now imported, the object being to show that native woods can satisfactorily fill many purposes for which foreign woods are now utilized.

Reports from Courtenay, B. C., indicate that the lumber industry in that neighborhood is very active, one mill at Royston, having received orders from a Winnipeg firm which will keep it running for two years; Mayor Kilpatrick's sawmill being in full operation and Urquhart's shingle mill being about to commence operation.

The Northern Pacific Railway has, during the past month or two, been furnishing a considerable number of cars for shipment of lumber by manufacturers on the lower mainland of B. C. This has greatly facilitated the trade of New Westminster and the Fraser Valley. During March the Company furnished about 500 cars.

A cigar shaped boom of logs was recently towed from Nicomen Island to Seymour Inlet, B. C., for the Shull Lumber Company. The boom drew 12 ft. of water and contained a million feet of timber.

Good Book-keeping Insures Success

How Accuracy in Accounting Methods Assists Dealers in Making Profits

By D. Cooper, C.A., Winnipeg

The main object of any merchandising concern is PROFIT. There are other objectives of great importance that should be kept constantly in view by the merchant—objectives that are closely related to the question of profit.

Profit consists of the sums obtained by the employment of capital in trading after paying all expenses of trading and after making any necessary provision for replacing lost capital.

It should be the aim of all who would court success—permanent and solid success—to sell merchandise of the very best grade, at the lowest possible price, to the greatest number of customers under the very best conditions for all concerned. Each and every transaction should result in mutual satisfaction and mutual profit. The greater the service rendered the greater the resulting profit—other things being equal.

To be able to sell the best grade of goods at the lowest possible price one must be able to buy keenly. To buy advantageously means that bills must be paid promptly and that cash discounts be secured wherever possible. This in turn requires sufficient capital to carry on the operations, and remember that insufficiency of capital is one of the greatest sources of danger in all phases of business.

Traders who cannot pay promptly cannot buy at the same price as those who can; the former are not able to take the discounts offered for cash, and, as a consequence, they are not able to sell to their customers at a price that can be defined as being mutually profitable to both parties.

A careful study of the business in all its phases will prove of value. A merchant should make himself thoroughly familiar with the goods he buys and sells. He should know how they are made; he should enquire as to the processes of manufacture; he should study transportation and learn the sources of the various products in the raw and in the finished state; he should study the requirements of local markets; he should learn how to manage—how to hire, train and direct employees; he should be honest; he should be familiar with simple business law—the law relating to contracts, bills of exchange and banking; and lastly, he should provide an adequate system for recording all his transactions in a simple and effective manner so that he may glean from his records a clear conception of the direction in which the business is moving.

The study of intelligently developed comparative statements will act for the merchant as a compass for the sailor and keep his course pointed in the right direction. The system must be so arranged as to bring automatically to the proprietor or manager at regular intervals, the results, in concrete form, of the trading operations—sales, purchases, inventory, collections, bad debts, goods returned by customers, and so on.

Without such information the business will probably drift along and, if eventually the business happens to be successful, it will most likely be the result of good luck rather than good guidance. On the other hand, failure is more likely to be the result from such loose methods of accounting. Experience has shown that in by far the greater number of insolvencies, the failure was due to the fact that the proprietor thought the business was going in one direction, while all the time it was travelling in another. He did not know. Had he known he could have remedied the defects and saved the concern.

In most cases, retailers and others are prone to believe that ordinary common sense bookkeeping could have kept them informed as to the cause and effect but, in my opinion, without accurate and dependable information as to results, the merchant or anyone for that matter, will simply drift on the open sea of Commerce until he finds himself involved suddenly in danger. In this event his calls for help are unheeded. He has not been travelling the chartered routes; hence he is left to shift for himself.

Take the case of another trader who can show a clear record of his business—year by year—its growth and development. In his case, even though in trouble in a period of stress, he may and often is able to show that his business is a profitable one and one worthy of support. He may form a Joint Stock Company or he may find some one willing to invest money for a share of the profits, or his bank may be willing to assist him.

All this is quite impossible where no records have been kept. There is no information upon which a reliable opinion may be based as to the wisdom of assisting the concern during a specially trying period; off-hand estimates or opinions as to what the business had done and is doing, made by the proprietor or manager, are of no value. They are not usually based on facts—neither can they be verified by accurate figures.

Unfortunately for Canada, traders are not compelled to keep books, whereas in France, for example, every trader is required by the Code of Commerce to keep three books—the journal, the inven-

tory book and the letter book. No particular form of accounts is prescribed by law. The journal in France is the daily book into which the trader must enter all his transactions, day by day. In addition to his business records, he must set down, month by month, the sums disbursed on his household expenses.

Before commencing to use the journal and inventory book, the French trader must take these to a Judge of the Commerce Tribunal who will initial each page and certify to the number of pages in each book. No erasures, blanks or marginal additions to entries are allowed. These regulations are designed as a preventative against wrongful alteration or substitution of figures. Where such exist, the books are not accepted as evidence, either in a court of law or in the event of insolvency.

Similar regulations are in force throughout Belgium, Spain, Portugal, Holland, Roumania and other European countries with but slight modification. In Russia no particular books are prescribed, but the laws are very strict as regards bookkeeping generally, and the penalties for non-accounting in the event of bankruptcy are severe. All Joint Stock Companies in Russia are required to publish in a State paper a Trading and Profit and Loss Account and a Balance Sheet once every year.

To bring the benefits accruing from accurate bookkeeping into more concrete form, let me cite what they would be in the case of a lumber merchant.

A lumber merchant has for sale different kinds of lumber, sash and doors, and so forth. He may, at the end of a period, find that he has just made expenses. It may be that he has no idea of the cash discounts he lost. It may be that he made good profits on one or more lines, and that he lost on other lines. It may be that his capital is being turned over once in one line, in the same time that it is being turned over six times in other lines. Even though he makes no profit on any one line of goods, still it may be that he will find it necessary to continue that line as a factor in holding other and more profitable business.

In any case, it goes without saying that if his records were to show him the profit he made on each different class of goods, he couldn't fail to benefit from that information. He would push the more profitable lines and only carry enough stock of the less profitable to satisfy the demands of his customers. If he had a comparative statement of his sales from month to month, alongside the figures for the same periods of the previous year, he would be able to anticipate slack months and busy months. In the former case he could plan how he might keep the month's sales up to normal. Then again, his expenses would be shown one month against another and one year against another. Any increase in the expense not warranted by increased sales should be carefully investigated and adjusted where possible.

Would it not be of great advantage if traders had constant information available as to debts which have to be paid at specified dates? Would it not be useful to know what orders for goods had been given for future delivery?

Accuracy is the twin brother of Honesty. It is nothing short of criminal negligence not to keep books. It isn't a square deal to your creditors—neither is it a square deal to your partners, your shareholders or yourself.

All these and a host of obvious other features will, I think, convince you of the absolute necessity of careful and accurate accounting in all businesses, from the one-man business to the gigantic corporations which began on a small scale and grew to their present size simply through the agency of a well defined business policy, based upon and continually guided by facts and figures reflecting precisely the effect of this policy and that policy on the progress of the business.

For the year ended December 31st last the net profits of the Riordon Pulp and Paper Company totalled $292,558, an increase of $45,480. Unusually low prices prevailed in 1915, but the improvements and enlargements at Hawkesbury resulted in a reduction of manufacturing charges and an increased output, while it is expected that the effect of the improvements will be shown in a material increase in profits during the present year. A substantial part of the company's output in pulp and lumber to be manufactured during the present year has been sold at good prices, and the outlook for the sale of the balance of the company's product at satisfactory prices is good. Arrangements have been made for the installation of a bleaching plant at the company's mill at Merritton, Ont., which should be in operation about July 1 next. The intention is to bleach the whole of the sulphite pulp produced at this mill, which will give the company a wider field in which to market this pulp.

David Mullen, Ottawa, Ont., who was engaged in the lumber business until a year ago, died recently at his home in that city. The late Mr. Mullen was 64 years of age and was born at Wakefield, P.Q., where he resided until moving to Ottawa some 19 years ago.

A Woman's Views on Retailing

By Mrs. C. C. Bowerman*

I wonder if you men have any idea of the things we women WANT that you have to **sell**?

The subject that Secretary Porter assigned to me is too large to be covered in the time at my disposal, but I can at least call attention to some of the points of retailing building material that I think have been overlooked. I shall limit myself to that part of your business which concerns the one thing above all others in which every woman is vitally interested—THE BUILDING OF A HOME.

How many of you men know what a woman really wants in a HOME? And if you do not know—how are you ever going to SELL it to her?

I am going to tell you some of the things she wants and why she wants them; and the nearer you come to providing those things for her, the nearer you will come to selling your material to her and consequently the nearer you will come to getting a check from her husband.

And right here I find a strange condition. In our office we have a set of the Porter-Ballard Plan Book SYSTEM, the "Home, Sweet Home" edition, and in that publication I find most of the answers to the questions I shall put to you. As this is published through the Western Association, I assume that you are all familiar with it.

Now, a woman wants a HOME to have the following elements: Her home must be—modern; attractive; comfortable; convenient; step-saving; moderate-priced.

And the homes represented in the plan book we have cover every one of those necessary elements.

But how is the woman going to know that? In other words, how are you going to sell what you have to sell, to a woman who wants such a home?

In the first place, you will have to let her know what you have. That means ADVERTISING. And what kind of advertising will appeal to her? "System" magazine recently asked this very question of the presidents of 94 women's clubs, the answer being a composit of the replies of the members of those clubs, thus representing very accurately the way women look at these things.

How the Women Answered

Here is the question:—"What method of sales solicitation appeals to you most as a customer—letters, personal calls; samples, newspaper advertisements, etc?"

The answers showed the following result:—57 per cent. favored newspaper advertisements; 13 per cent. favored samples; 7 per cent. favored personal letters; 7 per cent. favored telephone or personal calls; 2 per cent. favored demonstrations; 2 per cent. favored show windows; and 12 per cent. mentioned miscellaneous appeals.

Of course, I understand that this question was asked concerning general merchandise; but please note that you lumber merchants have at your command every single kind of an appeal—100 per cent of them—that the women themselves said had induced them to purchase.

Therefore, it is, to a certain degree of course, less important the way you put forth your appeal, as what that appeal really is. In other words, it seems to me that you should first find out what I want, and then, if you can do so, tell me that you can supply that want.

You can readily see that this subject could be extended into unlimited discussion, and I will therefore limit myself to the single phase of homes.

Note, as I stated above, that much over half of the women said they were influenced by newspaper advertisements. That means that you should use your local papers to tell us that you can satisfy our longing for that ideal home. Make that printed notice so attractive that we will, as soon as we see it, say to ourselves: "That's just what I want. Isn't that the dearest little home?"

And let me tell you a secret; when you do that much, the rest will be comparatively easy, for when we once make up our minds about wanting something, we stay right with it until we get it. You may think that you have made the decision, but, bless you, we made up your minds first.

After giving us the proper start—letting us "taste" that new home, so to speak—then you want to keep right on making its advantages more apparent. Use the other kinds of appeal,—the personal call, the letter, the show window, the demonstration, that the women have found so alluring.

Not to persuade us, remember; no, our minds have been made up on that point already. But to give us arguments that we can pass on to the check-writer of the family, and thus help you sell to us.

Invite Her to Your Office

Write us a nice letter and invite us to visit your office and see for ourselves that you have just what we want in a home. That's not so very hard to accomplish if you make your invitation attractive enough. But be very careful, when we do come, that you give us proof that you

*Address delivered before the Thirteenth Annual Conference of the Western Retail Lumbermen's Association, Portland, Ore.

really wanted us to come. You know a woman is very particular about her housework and she always polishes everything to the last degree when she expects a visitor; and she expects the same thing done for her.

Your office should be a real reception room. It should be kept in such a condition that your woman visitor will feel welcome and comfortable and at home, and will thus entirely lose the feeling of being on the defensive to protect her money. I really believe that cleanliness stands above Godliness with most women.

Missouri must have had a wonderfully large population at some time, for I believe most women must have been born there. They want to be shown. They want to feel and touch and taste and weigh and measure; and sometimes I really expect to have one of them ask for a sample of fir finish to match with her furniture.

Remember that a woman makes a business of buying; she loves to bargain—to shop—and you must consider that characteristic. You must make it easy for her to choose; you must meet her wishes thoroughly; you must even anticipate her desires; you must convince her that you are less trying to sell something to her than to fill her wants.

Now that you have induced her to visit your office, you will have before her, on the walls and tables, samples of your materials, pictures of Homes, and so forth. As a rule, while she wants a home, she has at the start only a vague idea of just what she wants. The first thing for you to do is, therefore, to ascertain generally her wishes.

Find Out the Price and What She Wants For It

For instance, you should find out about the price she wishes to pay; the size of the building; the number of rooms, etc., and each answer will narrow your field until you can finally offer for her selection a very few designs, any of which will meet one or more of her wishes.

Remember, also, that every woman has certain basic ideas about—not merely a home, but living in a home—and you must take those into consideration. Thus, let me illustrate with a sample design taken from the Home, Sweet Home plan book. This is the edition we use in Pocatello, and the one with which I am familiar.

Here for example, is design Number 702.

I wonder if any of you men have any conception of the number of steps a woman takes during the day in attending to her ordinary housework? I wonder if you know that she actually and literally walks hundreds of miles a year within those four walls? Don't you think that any means of reducing that travel would be most heartily welcome? I know what the woman has to do—I know that in the old style type of house—man-built—that point was entirely overlooked if, indeed, it was ever thought of.

Now, I say to my woman visitor something like this: "Modern home building has become a science as well as an art. I want you to look at this design, which in all other respects meets your wishes as to size and price. You know how many steps you take during the day, walking around halls and doors and back and forth in your present house. Now, draw straight lines between these points: Vestibule, living room, dining room; vestibule, hall, stairway, kitchen, back porch; living room, dining room, hall, stairway and so on.

"Note that in going from every usual place to every other usual place you walk in straight lines. And that arrangement of the rooms will save you one hundred miles absolutely useless walking every year."

Don't you think that sort of an argument would appeal to the woman who has walked all day in her house? If you don't believe it, just try it on your next prospect and see for yourselves.

Labor Saving Devices Important Features

Did you men know that a variation of only eight feet in the location of the kitchen sink means a difference of some 25 miles a year walking in getting meals?

Let me tell you right now that if you want to sell to a woman, or to a woman's husband, you must know what will appeal to a woman.

And I am inclined to suspect that one reason more homes have not been built is because only houses have been offered; mere buildings designed and constructed by men; and you know that to most men—business men—Home is only a place to eat and sleep in and go to business from.

In other words, you retail lumbermen, so far as you have had anything to say about the matter at all; so far as the architect and carpenter have allowed you to have a voice, you retail lumbermen have been trying to sell an article to the person least interested.

Woman's natural instinct is home-making, but you have for many years been ignoring this fact; you have been placing her under a great handicap; you have been giving her four walls, with rooms arranged to suit your own ideas or even perhaps to suit the sizes of materials the manufacturers send to you; you have gone on the principle that you were providing just as good a house as anyone else had; and you let it go at that.

It is just as easy to offer her what she wants as what she does not want; and it's easier to sell the first kind.

The man who designs a house will call attention to the splendid hall; but to a woman a hall is usually a place where the men-folks leave their hats, coats, rubbers and other impediments—a place they can muss us. A woman could easily get along without a hall, but she wants closets; lots of them, well-placed, large, well lighted. She wants places where she can put things away.

She Wants a "Culinary Studio"

And she wants a kitchen. No, she wants more than that. She wants a convenient, well-lighted, well-ventilated "culinary studio" where she can create meals. What do you men know about the preliminary work necessary to produce that appetizing dinner you find when you come home?

And she wants a home that is attractive to her visitors. She wants a home that is artistic on the outside. In fact she would not feel hurt to have such a home that strangers in the city will turn around for a second pleased look.

These are just a few of the things a woman wants in a home and they are all of them possible. If you men will find out what we women want, and then show us that you can fill that want, you will enlist us as unpaid, but as enthusiastic and capable salespeople.

I wonder if you ever considered the fact that the material you have for sale is the only material used in and around a home that the women cannot buy; I might go further and say that it is hard for anyone to buy it as it is used.

I believe that there is not a single home in any of the towns where you gentlemen are in business where at this very moment there is not something wanted which you have for sale.

It seems as though when the last workman leaves a house and the family moves in, that the interest of the building material merchant ceases. I think I am safe in saying that you gentlemen yourselves do not know all of the ways and means in which you could use your own stocks of materials in your own homes.

It is Easy to Provide Conveniences

There's nearly always a place for an extra shelf; there's an attic to be made into an extra room; there is always a step or so that needs fixing; there are stairs that can be made into various receptacles with great convenience to the woman of the house.

There are additional built-in features; clothes racks and posts; porches to be inclosed; hardwood floors to be laid over the old worn-out floors; closets enlarged or re-arranged; doors replaced or cut in; flower boxes; sleeping porches; pergolas; repairs and improvements without end; all of which require the goods you have for sale.

It's a woman's nature to make the best of things as long as she can—and it's a good thing for you men that she does so. But just try awakening her to the benefit of these things; call them to her attention in an appealing manner and see what will happen.

Don't write to her and tell her that her house is a disgrace to the town and she ought to fix it up. Certainly, things will be apt to happen in that case, also, but not exactly what you might like to have happen. Tell her of the advantage to her of, for example, having the treads of the back stairs boxed and hinged to hold the family overshoes. She'll see the point very quickly and she'll see that it is done, too. Try to convince her that you are trying to get for her what she herself wants, and you'll not only make the sale you have in view, but you will gain an active and earnest booster for your entire business.

Gentlemen, it is good business policy to find out from the woman herself what a woman wants; prove to her that you can supply those wants; make your place of business fit and proper and attractive for women to visit; don't try to force a sale on her but make it easy for her to buy—and above all, secure and maintain her confidence by deserving it.

The results to your business will more than justify all the thought and care and work you give it. Does this suggest anything to the wives of the retail building material merchants?

Lumber rates from Puget Sound to Australia, New Zealand, Peruvia and Chile have again made large advances. The rates to Australia and New Zealand ports have gone up 10 shillings per thousand feet, board measure and the rates to Callao, Peru and Valparaiso, Chile, have advanced 5 shillings per thousand feet. Rates to Adelaide or Melbourne, Australia, are now 120 shillings; Auckland, Wellington, Lyttleton, Dunedin and Sydney 110 shillings. Lumber rates from Puget Sound to Southern California ports have also advanced, going from $6 to $6.25 per thousand feet.

Mr. T. J. Stevenson, sales manager of the Riordon Pulp and Paper Company, Montreal, has been appointed a member of the executive of the Pulp Manufacturers' Association, New York.

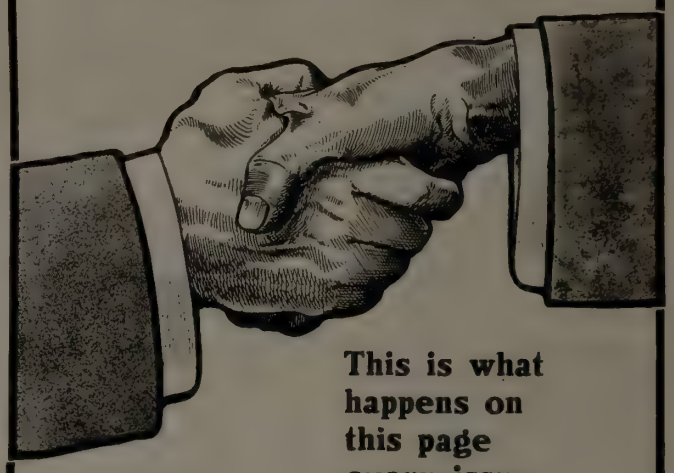
Mr. J. R. Booth, Ottawa, Canada's veteran lumberman, celebrated his 89th birthday on April 5th in his customary manner, by getting up early and attending to a full day's work.

WANTED & FOR SALE DEPARTMENT

Mr. Buyer

Are you in the market for a special bill of lumber? Would you like to pick up a real good second-hand planer or perhaps some logging equipment? Have you a vacancy in your plant for a filer or other employee? If you answer "Yes" to any of these, advertise on this page. It is the "Master of Ceremonies" and will introduce you to the man you want.

The Master of Ceremonies



This is what happens on this page every issue

Mr. Seller

You are looking for the man who is looking for you—you have for sale what he wants. All that is needed is an "Ad" on this page to bring you together. Appeal to this "Master of Ceremonies" and send us a small ad. today. What can we sell for you—or perhaps we can find you a job.

Send along your ad.

PUBLISHER'S NOTICE

Advertisements other than "Employment Wanted" or "Employees Wanted" will be inserted in this department at the rate of 15 cents per agate line (14 agate lines make one inch.) ($2.10 per inch) each insertion, payable in advance. Space measured from rule to rule. When four or more consecutive insertions of the same advertisement are ordered a discount of 25 per cent. will be allowed.

Advertisements of "Wanted Employment" will be inserted at the rate of one cent a word, net. Cash must accompany order. If Canada Lumberman box number is used, enclose ten cents extra for postage in forwarding replies. Minimum charge 25 cents.

Advertisements of "Wanted Employees" will be inserted at the rate of two cents a word net. Cash must accompany the order. Minimum charge 50 cents.

Advertisement must be received not later than the 10th and 26th of each month to insure insertion in the subsequent issue.

Wanted–Lumber

Basswood Wanted

No. 2 Common and Mill Cull. Winter cut preferred. Apply Firstbrook Brothers, Ltd., Toronto, Ont. 8-t.f.

Cedar Wanted

Good cedar for boat building. Best prices paid for the right material. Write for particulars. The Peterborough Canoe Company, Limited, Peterborough, Ontario. 6-9

Red Pine Wanted

Wanted to buy a stock of Red Pine. Apply Box 363, Canada Lumberman, Toronto, Ont. 6-8

Hemlock, Pine, Basswood

Wanted to buy one million feet Hemlock, also 1-inch Cull Pine and 1-inch Cull Basswood. Box 364, Canada Lumberman, Toronto, Ont. 6-8

Lumber Wanted

Wanted several cars maple, beech or birch squares 1, 1⅛, 1¼ in. x 42 to 60 in. in length. Write for particulars. J. Finlay & Sons Co., Norwood, Ont. 5-8

Lumber Wanted

Lumber wanted—100,000 feet beech; 1-in., 1¼-in. and 1½-in. thick; will have to be about ⅛-in. thicker to allow for shrinkage, etc., so that it will finish up to above dimensions; both dry and green; state price f.o.b. Galt. Shurly-Dietrich Co., Limited, Galt, Ont. 8-8

Basswood and Hemlock

Wanted to buy: inch cull Basswood, and 1 in. and 2 in. Hemlock. Apply M. Brennen & Sons, Hamilton, Ont. 7-8

Wanted

We are in the market for a large quantity of 2-in. Spruce Plank 4 in. and up wide, 8 feet and up long. Good merchantable stock. Kindly write us your lowest price. Box 334, Canada Lumberman, Toronto, Ont. 5-t.f.

Wanted

Several cars 16/4 Birch, No. 2 common and better grade. Must be dry and ready for immediate shipment. Write us your lowest price and full particulars. Box 333, Canada Lumberman, Toronto, Ont. 5-t.f.

Ash and B. C. Spruce

1-in. and thicker White Ash, dry or green. 1-in. and thicker clear, red and white British Columbia Spruce. The Elgie & Jarvis Lumber Company, Limited, Toronto Street, Toronto. 8-8

Maple and Hickory

Wanted, Maple and Hickory Axles, dry. Jackson Wagon Co., St. George, Ont. 8-8

Wanted

Wanted for shipment whenever in shipping condition:
2,000,000 ft. 3 in. No. 1 Com. & Bet. Soft Elm.
1,000,000 ft. 2½ in. No. 1 Com. & Bet. Soft Elm.
1,000,000 ft. 2 in. No. 1 Com. & Bet. Hard Maple.
500,000 ft. 2½ in. No. 1 Com. & Bet. Hard Maple.
Box 332, Canada Lumberman, Toronto, Ont. 5-8

For Sale–Lumber

Hemlock Ties

FOR SALE—Considerable quantity of hemlock ties suitable for Electric Railways, Sidings, etc., ready for immediate shipment. Monteith Bros., Rosseau, Ont. 6-10

For Sale

100 M. feet dry lumber, consisting of Pine, Spruce, Hemlock, Tamarac, Oak and Birch; also saw and planing mill. L. Garnett, Isbester, Ont. 8-8

Lumber For Sale

200 Pieces 1 x 15 and up 22 ft. Cypress.
375 Pieces 1 x 15 and up 24 ft. Cypress.
Clear for boat building, in stock at Montreal.

GEO. C. GOODFELLOW,
Montreal, Que.

For Sale

65,000 Feet GOOD DRY B. C. FIR

2½ to 5 in. thick by 6 to 12 in. wide. 60 ft. to 78 ft. long. Immediate delivery. George Kersley, 224 St. James Street, Montreal. 7-10

For Sale–Machinery

Machine For Sale

Two second-hand McGregor-Gourlay Q. Y. Planers and Matchers, one 9-in., one 15-in. wide; in good condition, ran every day till October, when fast feed Matcher was installed. Located in Saskatchewan. Box 384, Canada Lumberman, Toronto, Ont. 8-11

FOR SALE
Second-Hand Logging Machinery

One Loader, Two Skidders, One Three-Drum Hoisting Engine. All made by the Clyde Iron Works.

The Stearns Salt & Lumber Company,
8-8 Ludington, Mich.

Producer Gas Engine

For sale, second hand 45 H.P. Producer Gas Engine with gas producer, air pump for starting, blower, and small gasoline engine complete and in good condition. Burns pea coal, could be operated at a cost of about $1 per day. Will be sold at a very low price.
Canadian-Warren Axe & Tool Company, Ltd.,
7-10 St. Catharines, Ont.

Machinery For Sale

A small "Ad" under this heading, telling of what machinery you have for sale, will immediately put you in touch with buyers. Send us a list of machinery items and we will quote you on a small "Ad." Send the list now, before you forget about it. 1-t.f.

Portable Sawmill

Portable Saw Mill for sale in first-class condition. Capacity 10 M. feet per day. Double edger and everything necessary. Box 388, Canada Lumberman, Toronto, Ont. 8-9

Second Hand Sawmill Equipment

Consisting of
Forty Horse Boiler and smoke stack;
Thirty-five Horse Power Engine;
Three Knee Carriage and Track;
Three Saws, 4 ft. to 5 ft.;
Lumber Truck and Turn Table;
One hundred feet logcar chain, etc., etc.
Can inspect here.
B. BELL & SON COMPANY, LTD.,
8-8 St. George, Ont.

Engine For Sale

Corliss Engine, 150 H.P., 18 cylinder, 24 inch leather belt, with pump, first class condition, no fault, changing to Electric. Inspect at Guelph Lumber Co., Guelph, Ont. 5-8

Wood-Working Machinery

1—36" Crescent band saw, A1 condition	$75.00
1—24" Cowan double surfacer, A 1 condition	375.00
1—8" Crescent jointer	75.00
1—Variety saw table, iron	85.00
1—Wood frame, 8 ft. saw table	60.00
1—Combination drill and mortiser, McGregor-Gourlay, 4" stroke, table ¾ x 5½, raise and lower 12", side movement 10", knife 1" wide	50.00

Pollard Manufacturing Company, Ltd.,
5-8 Niagara Falls, Ont.

Machinery For Sale

Refuse Burner, 24 ft. diam, 100 ft. to spark arrester; all grate bars, 4 base doors, lined with fire brick; in good condition.

Smoke stock 7 ft. x 130 ft. to spark arrester, a1 condition.

Three Boilers, 6 ft. x 16 ft.; 70 4-in. tubes. 2 fire doors, 2 draft doors, fronts in a1 condition.

One No. 8 Buffalo Forge Co. Blower.

One Dean Duplex Steam Pump; 2—14 x 14 steam end; 2—12 x 28 water end, valves and piping.

All angle iron frames and galvanized roofing for large fire room.

All or any part at bargain prices.
Box 390, Canada Lumberman, Toronto, Ont. 8-8

Wanted–Employment

Advertisements under this heading one cent a word per insertion. Box No. 10 cents extra. Minimum charge 25 cents

Manager Complete Plant wants position, woods, railroad, saw mill. Big proposition wanted, no matter how difficult. Box 389, Canada Lumberman, Toronto, Ont. 8-8

LATH MILL MAN wants position to run a lath mill by the day or per thousand. Will go anywhere; ten years' experience. Reference. Box 369, Canada Lumberman, Toronto, Ont. 6-8

BAND, RESAW OR ROTARY SAWYER wants position. Six years' experience; sober and good references. Box 353, Canada Lumberman, Toronto, Ont. 6-9

BAND SAW FILER wants position, double or single cut. Twelve years' experience, first class references. Box 317, Canada Lumberman, Toronto, Ont. 4-9

EXPERIENCED LUMBERMAN wants position in lumber factory. Can take full charge of same and understand all the different machines, also filing. First-class references. Box 358, Canada Lumberman, Toronto, Ont. 6-8

DOUBLE BAND SAW FILER wants position, first-class references.

BAND MILL FOREMAN wants position, first-class millwright, and can handle men to good advantage. Box 359, Canada Lumberman, Toronto, Ont. 6-11

Experienced married man, fifteen years' experience, thorough knowledge shipping, inspecting, estimating, travelling, etc. Open for engagement, any time, best references; at present employed, desirous of change. Box 385, Canada Lumberman, Toronto, Ont. 8-9

Wanted—Employees

Advertisements under this heading two cents a word per insertion. Minimum charge 50 cents.

TIMBER CRUISER and traveller wanted. Apply Box 365, Canada Lumberman, Toronto, Ont. 6-8

Business Chances

Tie Contractor Wanted

Wanted a responsible contractor who would undertake to get out a quantity of ties in Ontario. Apply Box 366, Canada Lumberman, Toronto, Ont. 6-8

Planing Mill For Sale

Modern planing mill and lumber yard in growing town in Niagara Peninsula. Write Room 67, 18 Toronto Street, Toronto, Ont. 7-8

Business Opportunity

Make your opportunity knock at the door of every Lumberman in Canada by placing a small "Ad" about it in this column. Our rate is $2.10 per inch per issue. Now is a time when monied men are seeking good bargains. What have you to offer? 1-t.f.

Sawing Contracts To Let

We are prepared to let contracts at once for two or three portable or semi-portable saw mills to cut hemlock, hardwood and some pine on McKenzie Township near Parry Sound. Jobs will run from one million feet up, amounting in all to about fifty million feet. Would like to include some manufacturing and lath and shingles. Write at once, giving full particulars and experience and references.
HOLT TIMBER COMPANY, LTD.,
8-9 c/o Canada Lumberman, Toronto, Ont.

Miscellaneous

Screws For Sale

FOR SALE, at 85 and 10 per cent. off List, f.o.b. Brockville.
346 Gross ¼ x 14 F. H. Screws.
100 Gross 1½ in. x 14 F. H. Screws.
The McLaren Lumber Company, Ltd.,
8-8 Brockville, Ont.

Timber Limits For Sale

Berths No. 2 and No. 4 Nipissing, and Berth No. 4 Gurd. Hemlock, Birch, Pine and Spruce. Would sell berths separately. Close to Lake Nipissing. Great opportunity for jobbers on Nipissing berths. For particulars address Box 381, Canada Lumberman, Toronto, Ont. 7-10

are often received to "Wanted" and "For Sale" ads. on this page. Even 50 replies are not an uncommon return from the investment of the small amount a condensed ad. costs. And isn't that good business—to get right into close touch with so many people interested in what you have to buy or sell? For you can be sure their transactions with you will not end when they have closed the business your single ad. announced.

The Ferguson Lumber Company sawmill at Six Mile Creek, near Golden, which has been idle for several years, is now being overhauled, the owners having decided that market prospects now warrant a resumption of operations.

Prairie Province Lumbering

Although the prairie provinces are usually associated with but one pursuit, namely, farming, the forested portions give rise to a lumbering industry of importance, and, while inferior in development to those of British Columbia or the eastern provinces, are of great value to the immigrant settlement in the west. In 1913 some 188 mills in Manitoba, Saskatchewan and Alberta sawed approximately 250 million feet of lumber, valued at the point of manufacture at over $4,260,000. Of this quantity, Saskatchewan forests produced approximately two-thirds, Alberta one-fifth, and Manitoba the balance. The prairie market consumes about 1,434 million feet of lumber annually. Over one-half of this comes from British Columbia (in part from the Railway Belt portion), and the remainder is supplied from northwestern Ontario, the United States, and the home forests.

In the course of an address on the B. C. timber industry; delivered in the Legislature on March 8th, the Member for Comox, Mr. Michael Manson, said that over 770,000,000 feet of logs were cut in Vancouver district last year, the value of the timber being $16,200,000. Forty per cent. of this valuation represented labor, 17 per cent. transportation, 20 per cent. equipment and supplies, and 17 per cent. taxes, interest, etc. There were 445 separate logging operations in the district, 182 being represented by hand loggers. In 1915 the timber cut of the province, in board measure, amounted to 1,152,000,000 feet, valued at $29,000,000.

J. B. Sutton's shingle mill at Arrowhead, erected in July of last year, was purchased in December last by A. J. Waskett (formerly of Benton's Siding, Salmo district), and W. H. Donaldson, who have secured incorporation as the Diamond Lumber & Shingle Co., Ltd. A third machine is being installed in the plant, which will be operated night and day throughout the season.

The plant of the Edgewood Lumber Co., Ltd., at Castlegar, Nelson district, began cutting on March 13th, 65 men being employed in and about the mill in addition to about 200 in the firm's logging camps. Manager Waldie hopes to make a big cut this season and will operate until the latest date possible next fall in order to supply the strong prairie demand for lumber.

The sawmill at Cascade, Nelson district, owned by the Forest Mills of B. C., Ltd., was started up about the middle of March. About 80 men will be employed when the plant is in full operation.

The 18-Pounder 6-Round Shell Box
What It Costs to Manufacture It

The Superintendent of a box factory—an authority on the subject—estimates the cost under the most favorable conditions at 83 cents. He has written an extensive article, dealing with the various items, for the "Canadian Woodworker and Furniture Manufacturer." It will be published in the April issue. Every manufacturer who is studying his costs should read this article. If interested write for further particulars.

345 Adelaide St. West, Toronto

Review of Current Trade Conditions

Ontario

Retailers are reporting a slight improvement in the demand for building material, particularly in the smaller centres. Farmers apparently are coming into the market with moderate requirements for new buildings and additions to old buildings. In the larger cities the manufacturing industries are consuming a fair amount of stock, the furniture, piano and automobile manufacturers continue to use fairly large quantities of lumber and all are reporting quite an active trade. The building situation in the larger cities, while it is by no means active, shows a slight improvement and the indications are that, during the present spring and the coming summer, there will be a marked improvement in this line over the situation that existed last year. A number of architects who have been interviewed by the Canada Lumberman report that they have prepared plans for a fair number of buildings and that some of these are already materializing into contracts. Much of the building going on in the cities, however, is for manufacturers, there being only a very slight activity in the house building industry.

Continued discussion is heard in regard to the shell box industry. The large quantity of contracts recently awarded by the Imperial Munitions Board, as recorded in our issue of April 1st, does not seem to have created anything like the activity that might have been expected. We have heard that quite a number of these contracs have been refused by the parties who made the tenders, as the cost of manufacturing boxes has been advancing so rapidly, not only in regard to the price of raw material, but the cost of labor. These contracts were tendered for on very close margins; in fact many wholesalers who have figured upon stocks required, report that some of the contracts were tendered for at prices below the cost of production.

We understand that the Imperial Munitions Board is trying to place the contracts that have been turned down, but is not meeting with much encouragement. It is unfortunate that the conditions surrounding these contracts have led to such close figuring. If they had been let at prices involving a moderate profit in each case the advantage to the lumbering industry and the box making industry would have been very great.

The situation in connection with the production of lumber in Northern Ontario is rather uncertain at present. Reports from manufacturers indicate that in some districts the output will be considerably smaller han usual, while in other districts, notably that along the north shore of Georgian Bay, a fair production is expected. Hemlock production. will probably be considerably lower than usual Travellers who have recently called upon mills report that the quantity manufactured this year will show a decrease of from 25 to 50 per cent. as compared with previous years.

Eastern Canada

Sawing operations have again commenced at St. John, N. B. A few of the mills commenced early in April and the others were due to follow suit within a week or two. Heavy shipments of deals have been taking place lately, many vessels arriving and taking on cargoes for the Admiralty. During the next two months several million feet of deals will go forward on Admiralty orders. Most of the deals shipped recently have come from interior points. Prices are steady. Difficulty continues in connection with shipments to New England States, on account of the embargoes placed by railway companies upon lumber. If the railways are able to handle the business presented, a good season is expected by American buyers. Prices, when delivery can be made, for New England markets, are about $15.50 to $16 for 2 x 3 in. and 2 x 6 in., other sizes in proportion, f.o.b. St. John. Merchantable spruce boards are scarce and bring about $16.50 per M. Lath are about $3.25 f.o.b. St. John. Shingles are quiet with ample stock.

Driving operations are how under way on the St. John River from Fredericton to St. John. Bank logs are selling at about $13,50 to $14.00 and battens are bringing $9.50 to $10. per M. delivered St. John. The driving situation looks promising.

The lumber trade at Montreal during the past fortnight has continued on a quiet scale. Building permits, while small, are showing a little tendency to increase. Local yards are comparatively bare of stock. Large orders for spruce for United States points have been received recently, at better prices than those of a year ago. In each case prompt shipment is required. Cars continue scarce for shipment of lumber. The scarcity of vessels is also a continued handicap and it looks as though little or no improvement may be expected this year.

The spruce market at Boston has improved considerably during the past fortnight. At Boston and Maine points, quotations for spruce frames are $27, and at N. Y., N. H. and Hartford points the quotation is $28. Random is moving well at the following prices:— 2 x 3 in., $21.50; 2 x 4 in., $22 to $22.50; 2 x 5 in., and 2 x 6 in., $21.50;; 2 x 8 in., $25; 2 x 10 in., $26.50; 2 x 12 in., $27.50. Stocks of spruce at New York are scarce. There is a better demand for hemlock at Boston, building contractors showing signs of turning to it instead of Southern pine which is handicapped by the railroad embargoes. Very little hemlock is crossing from Canada to United States markets. Some is going by vessel but most of it goes to New York or Sound Ports. Hemlock boards are in good demand at Boston. Good clipped hemlock boards, 10, 12, 14, and 16 feet are bringing $22.50 per thousand feet, and some producers are asking $23.

The shingle market at Boston continues rather quiet but prices are firm. Red cedars are still strong, extras bringing from $3.68 to $3.88. White extras are selling at from $3.40 to $3.50. Lath are in good demand and firm. At Boston 1⅝ in. are selling at $4.20 to $4.25 and 1½ in. at $3.90 to $4.

Great Britain

Prices of spruce deals in Great Britain at present show very definitely that this timber has been under-valued in the English market in the past, as the advance that has taken place lately in spruce deal prices is greater in proportion than that which has taken place in any other classes of wood. 3 x 11 in. spruce deals are selling at from £32 to £35, 3 x 9 in. at £30 to £31, and battens at £27, £28 and £29 per standard. At Liverpool spot lots of spruce deals for liners are quoted by shippers at £30 per standard c.i.f. with war insurance extra, while £29 has been quoted at Manchester. Forward business is very limited and the absence of steam tonnage is sure to have a very serious effect on the Manchester market. Shipowners appear to be rather nervous about the use of Mersey ports. Stocks of spruce deals are quickly being reduced to a minimum at both Liverpool and Manchester, both in importers' and consumers' hands. The consumptive demand continues strong and arrivals are very much less than the quantity consumed. Birch spot values at Liverpool are still climbing. Recent arrivals have quickly passed from importers' hands to the consumers. As imports are restricted stocks will be rapidly cleared out. All pine goods are advancing in price at Manchester. Third quality Quebec pine is offered at about £36 for 3 x 11.

At London, the spot market continues fairly active and deliveries are quite extensive, considering the stock from which they are drawn. Forward business continues on a small scale as a result of the enormous freight rates now asked. At Foy, Morgan & Company's recent auction sale 3 x 9 in. unsorted Quebec spruce, at a wharf, sold for £29 5s. 3 x 9 in. fourth quality brought £26 10s. 3 x 8 in. unsorted red pine brought £26 10s. 2 x 4/13 hemlock from St. John brought £21 5s.

United States

Business and industrial conditions throughout the United States continue to indicate that this year will be an excellent one for the lumber industry and trade. The indications today are that during the present spring the building activity will be greater than it has been for years. This satisfactory condition appears to exist in all parts of the United States, but is far more pronounced in the New England States than elsewhere. Factories throughout the New England territory are overloaded with orders and are finding it necessary to increase their facilities for production, which is resulting in plans for new buildings and additions to old ones. The activity, moreover, in the East, is not confined to factories, but includes the house building industry as well, as a result of the great number of employees who are receiving good wages and planning to build or buy new homes. An interesting feature in connection with the building situation in the New Egland States is a great increase in the number of slow-burning or mill construction buildings that are being planned, or that are in the course of erection. The price of steel has soared so high that mill construction is becoming more and more popular.

The improvement in the building situation is only one feature in the general prosperity reported from all over the United States. In the steel trade, continued activity is reported and there are no signs of an early decrease. Steel mills, in fact, are loaded down with as

View of Mills in Sarnia.

BUY THE BEST

Retailers and woodworking establishments who like to get A1 NORWAY and WHITE PINE LUMBER always buy their stocks from us because we can ship them on quick notice. It pays to have the goods, but it pays better to "deliver" them.

We also make a specialty of heavy timbers cut to order any length up to 60 feet from Pine or B. C. Fir.

"Rush Orders Rushed"

Cleveland-Sarnia Sawmills Co., Limited

SARNIA, ONTARIO

B. P. Bole, Pres. F. H. Goff, Vice-Pres. E. C. Barre, Gen. Mgr. W. A. Saurwein, Ass't. Mgr.

much business as they can handle for all of 1916 and part of 1917. If they would take on further business they could easily secure it. The railroads, in nearly all cases, are handling the heaviest business in their history, and this is at a time of year when, as a rule, there is a considerable reduction in the quantity of tonnage offered. The scarcity of railroad cars is conflicting with industrial expansion everywhere.

In the lumber situation probably the most interesting news comes from the Pacific Coast, and from the Inland Empire, where the output has been extremely heavy and the quantity of cars available for shipment has been fairly satisfactory. With the early resumption of traffic through the Panama Canal in sight, and a number of lumber carrying vessels under construction at Pacific Coast ship yards, the outlook for shipment of Pacific Coast stocks to Atlantic Coast points is good, and manufacturers are looking forward to a big trade in these markets.

Southern pine manufacturers have not been doing well in regard to the quantity of railroad cars received, and their business is being held back to some extent on this account. There is an excellent demand for material for mill construction buildings. Production is being maintained at a reasonable level. Shipments of material for railroad purposes are large. Lack of transportation facilities is also troubling the mills along the south Atlantic coast.

Encouraging conditions continue to be reported in connection with the hardwood situation. Vehicle and implement industries are active and most of the consuming factories are busier than they have been for two years past.

There is a good movement in northern pine. At Chicago, the demand is more marked for No. 2 and No. 3 boards. No. 1 Norway is also in demand. Stocks are almost off the market. At Buffalo there has been an increase in the demand for northern pine during the past fortnight, as a result of greater building activity. Lower grades are moving well. The car shortage is troubling dealers at North Tonawanda. There has been a strong demand during the past fortnight at this point for stock for retail yards and buyers are wanting immediate deliverey.

The hardwood trade at Buffalo has shown definite improvement since the first of February. A fairly good demand is expected from now on. Advances of about $2 per thousand are reported for firsts and seconds in maple, basswood and ash. Red birch is firm and sap birch shows an advance of about $2 in firsts and seconds. Common grades are unchanged. but firm.

Market Correspondence

SPECIAL REPORTS ON CONDITIONS AT HOME AND ABROAD

Ottawa Valley Output Likely to Show Reduction

Ottawa, April 9th; (Special to the Canada Lumberman):—Owing to the excessive amount of snow and ice which remain in the woods, the spring drives in the Ottawa districts will be at least two weeks later than last year. However, as most of the lumber firms are still working at the spring cut, the lateness will not occasion much inconvenience. As to the quantity that will be brought down this season it is generally thought that it will be considerably less than last year. Some lumbermen think that it will be normal, however, when the large number of logs remaining from last year are added to this winter's cut.

During the past two weeks there has been quite an improvement in the lumber trade in the American market and local lumber dealers are looking forward to a still better trade from that quarter. The local Canadian trade has also picked up well, but this is owing mainly to the shell box business, which trade is consuming a large quantity of lumber.

All indications point to a greater shortage of tonnage to take care of the British shipments during the coming season of navigation, but the principal lumbermen are hoping that other markets will develop to dispose of the grades usually shipped to the United Kingdom. Just now, spruce is very strong in the New York market, and the same may be said of lath. Quite a number of sales of lath have been made during the past week, for the coming season, at an advance in prices over those of last year.

St. John Mills Commence Sawing

Saint John, N. B., April 6th, (Special to the Canada Lumberman):—The past two weeks have seen the beginning of sawing operations for the season of 1916. Messrs. Stetson Cutler & Co., and Murray & Gregory, Ltd., have started their mills; the former sawing largely for the American market and the latter for the English market. The other mills in this vicinity will follow along during the next few days, practically all sawing English deals.

Shipments of deals have been extremely heavy during the past two weeks, as many boats have arrived and departed with Admiralty orders. It is said that orders have been taken for delivery during the next two months which run into several millions. Nearly all the deals shipped lately have been from interior points, being portable sawn stock. Prices remain unchanged, the only great trouble is to get tonnage and cars, one seeming about as scarce as the other. Nearly all the railroads in New England have placed embargoes on lumber during the last few days. The embargo on the N. Y., N. H. & Hartford Railroad has been lifted, but for how long, seems impossible to say. Should the railways be able to handle the business put up to them, the American buyers look for a good season, and fair prices. On account of the embargo it is almost impossible to state prices, but where deliveries can be made, 2 x 3 in. and 2 x 6 in. are worth $15.50 to $16. 2 x 4 in., $16.50; 2 x 8 in., $19; 2 x 10 in., $22, f.o.b. St. John.

Merchantable spruce boards are almost impossible to find, and are readily bringing $16.50 per M. English deals are still firm at prices previously quoted and mills are well sold up.

Laths are bringing good prices, and are selling at about $3.25 f.o.b. St. John.

Shingles show no upward tendency, and stocks are ample. With the mills beginning sawing, stock will increase.

The box shook trade remains good, with foreign orders well placed.

The St. John river from Fredericton to St. John is now open and the drift down is being well followed up as many logs are afloat, the St. John Log Driving Company are well prepared and will take care of the logs adrift. This is an extremely costly process but, must be attended too or otherwise the logs would go to sea. Bank logs are beginning to come in and are bringing around $13.50 to $14.00, with battens at from $9.50 to $10 per M. delivered St. John. Driving conditions look good. All that is needed is rain to set in motion the ice, clearing out the streams, rolling in the logs and sending them down stream.

Locally the building trades are quiet and orders limited. Conditions do not warrant any expensive building operations, but should a change for the better occur, it is felt that building would take on a new lease of life, and, as factories would be fully prepared to meet any increase, a profitable season could no doubt be worked out.

The annual meeting of the St. John Log Driving Association was held on April 5th. The old board of directors was re-elected with the exception of A. Morrison, of Fredericton, who was replaced by H. Usher Miller, of St. John. At a subsequent meeting of the directors J. Fraser Gregory was re-elected president, and Walter Jackson secretary and manager.

The annual meeting of the Tobique Log Driving Company was held on April 5th. Mr. F. C. Beatteay was elected president, J. C. Hartley, secretary treasurer and Donald Fraser, Archibald Fraser, J. D. McLaughlin and H. Usher Miller directors. A contract was entered into with J. D. McLaughlin for driving on the river.

Car Shortage Affecting Montreal Trade

Montreal, April 10th (Special to the Canada Lumberman):—Judging by the building permits for last month, the building trade is picking up a little. The figures are nothing to boast about, but in view of the tendency to drop below last year's poor totals, it is satisfactory to find that the past month was almost equal to March, 1915. The permits were valued at $243,345, a decrease of $3,350, while for the three months the total of-$483,420, was $408,516 lower as against last year.

Local trade is on the slow side, with yards comparatively bare of stock. Members of firms interested in shell boxes who have just come back from Ottawa report that there are not likely to be further orders for some time.

Some very large orders for spruce for United States account have been received, at better prices as compared with those ruling this time last year. Prompt shipment has been requested.

There is a continued shortage of cars, which is affecting some Montreal wholesalers. In this connection, the C. P. R. has placed a temporary embargo on loaded cars for delivery to the I. C. R., it be-

ing contended that the Government road has failed to take delivery of loads which the C. P. R. is holding, resulting in congestion at C. P. R. terminals. Mr. F. P. Gutelius, however, denies that there is ground for this embargo, stating that the International is handling all C. P. R. traffic offered, and that the fault is with the latter company in not switching the cars out of the terminals.

Present appearances are against heavy exports from this port to the United Kingdom. The prospective tonnage will be smaller than that of last season, and the steamship companies do not hold out any hope of being able to ship large quantities on any vessel. Two or three lumber firms have already made arrangements for shipping a fair amount by tramp steamers, and it is more than likely that other tramps will have to be chartered if very large quantities of lumber have to be sent. The prohibition by the British Government of the import of birch, except under license, will mean an appreciable reduction in the wood exported from Montreal. At the same time this description of lumber is required for so many purposes, including war purposes, that it is probable the prohibition will not be pressed to an undue extent. Although the United Kingdom took large shipments from Canada last season, consumption has been rapid, and more stock will be required.

The continued restricted imports of sulphite pulp from European countries into the United States have again stiffened quotations of Canadian productions. The demand is greater than ever, and United States firms are making urgent requests for all the sulphite that can be made in this country. It will be many weeks before Europe can send anything approaching substantial quantities, and with an increasing request for our sulphite the immediate market outlook is extremely satisfactory. Ground wood has also improved, while newsprint mills are running to capacity.

Saw Gauges—Standard or Thin

Discussing the above subject from an extensive and varied experience with both kinds, I cannot find any advantage in thin saws for the work of today.

My preference is a saw 7-gauge at the centre and 8 on the rim, fitted with a point 9/32-inch wide, and for cutting hard woods or frozen timber, a still narrower kerf is better. My experience, together with that of thousands of mill men and skilled sawyers, has demonstrated that the extra gauge at the centre adds very materially to the standing-up qualities of the saw without perceptibly reducing the clearance. In saws 54-inch and up, 6-gauge at the centre and 8 on the rim, is still better, where heavy feed can be used. Very many mill men are using log saws two gauges heavier at the centre, regardless of the diameter of the saw and its feed.

A saw ground with a heavier centre is not so susceptible to the variations of speed. It will hold its line much better than the thin blade, thus preventing friction, heating, buckling, loss of power, and re-hammering charges, which is an item in the life of a saw. All the resistance applied to the rim of a saw in its passage through a log must be supported by its centre. A strong centre saw will stand up where a thin saw fails. The consequence is that the thin saw is running in and out of the log, using power wastefully, and making cull lumber, besides drawing the tension out of the blade by the friction produced between the saw and the log.

It will be in order to find the thickness in decimal parts of an inch in the different gauges we are discussing as well as in fractional parts of an inch.

A 6-gauge blade contains .203 of an inch or is scant 13/64-in. thick.
A 7-gauge blade contains .180 of an inch or is scant 3/16-in. thick.
A 8-gauge blade contains .165 of an inch or is scant 11/64-in. thick.
A 9-gauge blade contains .148 of an inch or is full 9/64-in. thick.
A 10-gauge blade contains .134 of an inch or is full 1/8-in. thick.

We find that an 8-gauge is 3/64-inch thicker than a 10-gauge on the rim, and is still thicker on the centre, according to the number of gauges added there.

The mill man desires a 9-gauge saw because he figures that in cutting ¼-inch kerf, he saves 1/32-inch over and above an 8-gauge cutting 9/32-inch, thus gaining one 4/4 board in thirty-two cuts. He can do this, if his power is ample, and his appliances just right, but his set works ought to graduate to the one-hundredth part of an inch, and lock when he sets up, with no lost motion between the set shaft and the knee, so that the cant is firm and rigid where he sets it; and to save one board on a decrease of 1/32-inch kerf, the log would have to be at least forty inches in diameter. It must be remembered that the thin saw requires more uniform speed and more teeth than the heavier standard gauge. The proper speed must be maintained throughout. A thin saw, travelling at the speed for which it is tensioned, does not travel on the same line when the velocity is reduced. This often occurs in one and the same cut. The product under such conditions is thin and thick boards, feather edged boards, and wedge shapes. The planing mill man gets fuel from thick boards in planing to specifications (freight paid). No one can tell where a saw will travel when it has lost its standing-up qualities for lack of velocity. It is seeking the course offering the least resistance to its passing through the log.

It is a mistake, and a serious mistake, for anyone to give specifications for a saw calling for a feed largely in excess of his actual requirements. The saw should be adapted to the actual capacity of the mill. This will be governed largely by the available power, or the power left for the circular, after allowing for auxiliary machinery, such as slab slasher, edger, sawdust conveyor, trimmer, etc. The specifications given the saw maker is usually the maximum power of engine, and the available power to drive the circular is not given. The lack of this information is misleading to the saw maker in adjusting the tension.

Sawyers and mill men have discussed the proper mandrel speed for circular saws, since when the memory of man runneth not. They seldom consider adapting thickness of saw to power and true capacity of mill because a circular saw is a circular saw. One saw requires as much clearance on each side as the other saw, regardless of thickness of blade. This is eminently correct, but the speed for a thick standard gauge saw should be 10,000 rim feet per minute, thin saws more. This will require a mandrel speed for a 52-inch standard saw of about 750 revolutions per minute. If the available power is insufficient to maintain the speed for which the saw has been tensioned then find the speed that you can well maintain, and have the saw maker adjust the tension of the saw to this speed. There is no better rule.—Disston Crucible.

Mr. A. W. Wheatley

Mr. A. W. Wheatley, president of the Lima Locomotive Corporation, Lima, Ohio, whose portrait we publish herewith, was born October 12, 1870, at Ashford, Kent County, England. At the age of fifteen he began, as a rivet boy, in the shops of the South Eastern Railroad, and in 1887, apprenticed himself as a machinist, attending night school. In 1892 he came to America and entered the employ of the Northern Pacific Railroad at Brainerd, Minn., as machinist, and in 1893 was transferred to Staples, Minn., in the same position. In 1895 he was made foreman, occupying that position until 1900; transferred to Livingston, Mont., as general foreman in December, 1902, and later was made master mechanic of Yellowstone Division, headquarters at Glendive, Mont. In June, 1903, he was appointed shop superintendent at Brainerd, Minn., and in April, 1904, was appointed general master mechanic of the entire system of the Northern Pacific

A. W. Wheatley, Lima, Ohio.

Railway. In February, 1905, he accepted a position on the Rock Island Railway as shop superintendent at Moline, Ill. In March, 1906, he accepted a position as assistant superintendent of motive power of the Union Pacific Railway, with headquarters at Omaha. In June, 1907, Mr. Wheatley entered the employ of the American Locomotive Company at Schenectady as general inspector. He was transferred to Montreal in December, 1907, as manager of the American Locomotive Company's plant in that city. In November, 1910, he was transferred to Dunkirk, N. Y., in charge of that plant. In June, 1911, he accepted an offer from the Canadian Locomotive Company at Kingston, Ont., and was chosen as vice-president and general manager of that company, which position he resigned on March 1st of this year to accept the presidency of the Lima Locomotive Corporation.

A steel dock is to be constructed at Port Arthur, Ont., to facilitate the shipment of lumber and pulpwood.

EDGINGS

Ontario

The Canada Builders, Limited, Orillia, Ont., are contemplating the erection of a planing mill. The building will be 200 x 65 feet, of brick construction.

Mann's sawmill at the corner of Aylmer and Dalhousie Streets, Peterboro, Ont., was recently destroyed by fire. The firemen were able to remove most of the machinery.

P. W. Clement has bought Kippen's planing mills at Perth, Ont. Mr. Clement was formerly engaged for many years with Mr. Kippen as office manager and bookkeeper.

The Guelph Lumber Company, Guelph, Ont., are building a dry kiln adjoining their planing mill. The dry kiln will be equipped with the latest improvements and will be operated by the vapor system.

The Riordon Pulp & Paper Company, Merritton, Ont., are preparing plans and specifications for making additions to their plant. The architects are the Moulton Engineering Corporation, 120 Exchange Street, Portland, Me. The plant is to be of reinforced concrete construction.

Reports from Fort Frances, Ont., state that the Shevlin Clarke Company are expecting to operate their mill at full capacity both day and night during the present season, starting early this month. This will give employment to over 1,000 men in the town and another 500 in the woods.

The Hillcrest Lumber Company, Limited, has been incorporated with head office at Renfrew, Ont., and capital stock of $400,000, to carry on business as timber merchants, sawmill proprietors, etc. Those interested are J. M. Austin, G. B. Ferguson, D. W. Stewart, J. Geale and S. T. Chown.

Oliver Schram, Hymers, Ont., will erect a modern sawmill upon the site of the old Vigar's mill on the water front at Port Arthur, Ont. Some of the old buildings will be used and new ones will be added. The company has a contract for three million feet of lumber for James Hourigan & Company, to be shipped to Chicago.

The Reid Wrecking Company, Sarnia, Ont., are repairing their booms in readiness for this year's towing. The company will tow down the lake about 25 million feet of logs for the Cleveland-Sarnia Saw Mills Company, Sarnia, Ont. The Cleveland-Sarnia Saw Mills Company started sawing for the season on April 4th. The plant will be operated daily until the ice forms next fall.

The International Lumber and Wood Products Corporation, Limited, has been incorporated with head office at Toronto, Ont., and capital stock of $50,000, to carry on business as manufacturers of and dealers in lumber, timber logs, pulpwood, etc. The provisional directors are C. E. Ritchie, E. B. Stockdale, C. W. Kerr, F. W. Stockdale and P. B. Rapp, all of Toronto.

The Town Council of Gore Bay, Ont., will submit a by-law to the ratepayers to exempt Mr. W. E. George's planing mill and sawmill from taxation for ten years and to give him a cash bonus of $500 in order to assist him in rebuilding the plant. It is expected that the township will also grant a bonus of $500 and exemption from municipal taxes for ten years. If this assistance is carried out Mr. George will rebuild.

Beauman & Letson, Elmira, Ont., recently lost their sash and door factory by fire. The amount of the loss is estimated at $10,000, which was partly covered by insurance. The owners will rebuild at once and will be in the market for the following machinery:—sander, planer, matcher, rip saw, swing saw, buzz planer, shaper, turning lathe (hand), band saw, trim saw, mortise and tennon machine, sand drum, 2 boring machines upright and side, and belting. Communications are to be addressed to Noah Beringer, Arthur Street, Elmira, Ont.

Eastern Canada

The sawmill belonging to Albert Caron, St. Adalbert, P. Q., was recently destroyed by fire at a loss of $4,000.

The sawmill belonging to Aug. Blais and F. Latourneau, St. Paul du Buton, County Montmagny, P. Q., was recently destroyed by fire.

A sawmill is being erected on the Sixth Range of Ditchfield near Cookshire, P. Q. The parties interested reside in Sherbrooke, P. Q.

The Miner Lumber Company, Limited, Coristine Bldg., Montreal, P. Q., are in the market for the purchase of woodworking lathes.

Jos. Cauchon, Chateau-Richer, Co. Montmorency, P. Q., recently lost his sawmill by fire, the loss being $7,000. The owner will rebuild and will be in the market for machinery. The building will be of frame construction with tin roofing.

John Breakey, St. Helene de Breakeyville, P. Q., is contemplating the erection of a sawmill to cost $7,000.

L. Wisintainer & Son, 58 Boulevard St. Lawrence, Montreal, P. Q., are calling for tenders for the construction of a sash factory on St. Catherine

Street East. The architect is L. J. Bigonesse, 92 Notre Dame Street East. The building is to be of trussed concrete construction.

W. J. Carnworth's lumber camp near Harvey Corner, Albert County, N. B., together with all its contents, was recently destroyed by fire.

The sawmill belonging to Omer Bergeron, St. Clothilde, P. Q., was recently destroyed by fire, incurring a loss of $7,000. The owner will rebuild and will be in the market for machinery for steam power.

The Cape Breton Pulp Company's buildings at Murray, Ste. Anne's Bay, are now practically completed and the machinery for pulp making is being installed. The buildings and plant are of the latest type. At first the company will only prepare wood for shipment, but before the end of the year it is expected that they will be turning out pulp.

Western Canada

Brown & Rutherford, lumbermen, Winnipeg, Man., have been registered as co-partners.

The International Mercantile Company, Limited, lumber dealers, Wymark, Sask., have sold their lumber business to the Beaver Lumber Company, Limited.

Alexander McRae, Revelstoke, B. C., will erect a sawmill with a capacity of 25,000 feet per day to cut timber on his limits situated in the vicinity of Trout Lake.

The Baker Lumber Company, Limited, Waldo, B. C., resumed operation at the end of March. Everything points to an active and prosperous year in the lumber business at this point.

J. R. Morgan, Limited, has been incorporated with head office at Prince Rupert, B. C., and capital stock of $10,000, to acquire, operate and deal in timber limits, sawmills, shingle mills, box factories, pulpmills, etc.

McNair & Graham, shingle manufacturers, Rosedale, B. C., are making additions to their plant. They are installing a new dry kiln and building a boarding house. They have commenced operating a night shift which increases their capacity by fifty per cent.

The Saginaw Canning Company, Limited, have been incorporated with head office at Vancouver, B. C. and capital stock of $25,000. They are empowered, among other things, to carry on business as timber merchants, sawmill, planing mill and shingle mill proprietors.

The Forest Mills of B. C. Limited, are resuming operations at their mill at Cascade, B. C. It is expected that employment will be given to about 80 men when the plant is in full operation. Plans have been completed for the operation of the plant throughout the entire summer.

The Eldorado Lumber Company, Limited, has been incorporated with head office at Vancouver, B. C., and capital stock of $25,000, to carry on business as manufacturers of and dealers in lumber and shingles, shingle mill and sawmill owners, loggers, and lumber and shingle merchants.

The Northern Cedar Logging Company, Limited, has been incorporated with head office at Vancouver, B. C., and capital stock of $10,000, to carry on business as loggers, timber merchants, sawmill, shingle mill and pulpmill proprietors and to manufacture and deal in timber, lumber, shingles, etc.

Tenders are being received by the Minister of Lands for British Columbia until May 10th for the purchase of License X83, to cut 6,510,000 feet of Douglas fir, hemlock, cedar, and white pine on an area adjoining Lot 2695, Thunder Bay, Jervis Inlet, New Westminster District. Two years will be allowed for the removal of the timber.

The Nanaimo Canners and Packers, Limited, Nanaimo, B. C., who have recently obtained a charter are granted powers which include the following:—to carry on business as suppliers of lumber, sawmill owners, loggers, lumber merchants and manufacturers of and dealers in lumber, timber, laths, shingles, sash and doors, etc. The capital stock of the company is $50,000.

The new sawmill at Lombard, B. C., belonging to the Smith's Timber Company of Vancouver, will commence operations about the middle of this month. Messrs. Miller and Slater, who have just finished their logging and sawing contract for the Cook's mill are moving their logging outfit to Lombard and will operate the new mill for the Smith's Timber Company.

The Pacific Mills, Limited, 808 Standard Bank Building, Vancouver, B. C., are contemplating the erection of paper and sulphite mills, etc., at Ocean Falls, B. C., 300 miles north of Vancouver. Work will be done by day labor under the company's supervision. The plant will be of reinforced concrete construction. Two wharves will also be erected. The president of the company is Mr. J. H. Lawson and the secretary Mr. W. S. Lane.

The Consolidated Lumber & Shingle Company, Limited, has been registered as an extra-provincial company with head office at Bellingham, Wash., and provincial office at 40 Lorne Street, New Westminster, B. C., to carry on business as manufacturers and dealers in lumber and shingles and to own and operate sawmills. The capital stock of the company is $10,000. J. R. Grant, New Westminster, is attorney for the company.

Abernethy & Lougheed Limited, owners of the sawmill at Port Haney, B. C., are making preparations for taking out 30,000,000 feet of timber this summer from their limits in the Stave Lake district and other parts of the Dominion railway belt. The mill at Port Haney is to be re-opened this month, but the bulk of this season's output of timber will go to other mills. Last year Abernethy and Lougheed Limited took out about 25,000,000 feet.

SPARTAN
A SPARTAN is the first belt to operate successfully what is considered the hardest quarter-turn drive in the State of Washington. The belt drives the entire planing mill, it has already outlasted any former belt, and is still in excellent condition.
SPARTAN
LEATHER BELTING
because of its strength, pliability and pulley grip is particularly adapted to the most difficult drives in your mill.

October 18, 1915.
The Graton & Knight Mfg. Co.,
Seattle, Wash.
Gentlemen:
In reply to your query of recent date regarding service rendered by the 14" Spartan Double Belt you installed on our quarter turn drive, we wish to say the belt has been entirely satisfactory, and owing to its extreme pliability and friction we feel we have at last secured the right kind of belt for this particular drive.
Yours truly,
DONOVAN LUMBER COMPANY.

Sample of Egyptian Liniment

We know that when you have once used our Egyptian Liniment on your horses you will always keep it on hand; that is why we offer free samples to lumbermen. Just write and ask for your sample. Its greatest use is to stop bleeding immediately. It is also excellent in cases of toothache, sore throat, neuralgia, rheumatism, etc., it effects immediate relief. In the stable its use is invaluable for thrush, cuts, spavins, calluses, etc.

Send at once for your free sample.

A train of CLARK Chilled Tooth Line Rolls fitted to steel roll casing.

Comes assembled as shown ready to set in the mill.

Keeps rolls and drive in perfect alignment so the life of roll and gears is increased and upkeep cost decreased.

Furnished in all sizes and lengths.

Dominion Timber Regulations

Licenses to cut timber on Dominion Lands in the Provinces of Manitoba, Saskatchewan, and Alberta, the Northwest Territories, within twenty miles on either side of the main line of the Canadian Pacific Railway in the Province of British Columbia, and in the tract of three and one-half million acres to be located by the Government in the Dominion in the Peace River district in the Province of British Columbia, lying east of the Rocky Mountains and adjoining the Province of Alberta, shall be disposed of by public auction at the office of the Dominion Timber Agent for the districts in which the berths are situated.

Before any parcel of timber is offered for sale it shall be surveyed by a duly qualified Dominion Land Surveyor into berths of an area not exceeding twenty-five square miles, and each of such berths shall then be thoroughly cruised by a duly qualified timber cruiser in the employ of the Dominion Government. The Minister shall then fix an upset price at which the berth shall be disposed of, and no berth shall be sold at less than the price so fixed.

Purchases to the amount of one thousand dollars or under shall be paid in cash at the time of sale. Purchases over one thousand dollars and not exceeding five thousand dollars shall be paid, one-half in cash at the time of sale, and a note or notes shall be given for the remaining half of the purchase price, payable in three months, with interest at the rate of five per cent. per annum. Purchases over five thousand dollars and not exceeding ten thousand dollars shall be paid one-third in cash at the time of sale, and notes shall be given for the remaining two-thirds of the purchase price, payable in three and six months, with interest at the rate of five per cent. per annum. Purchases exceeding ten thousand dollars shall be paid one-fourth in cash at time of sale, and notes shall be given for the remaining three-fourths of the purchase price, payable within three, six and nine months, with interest at the rate of five per cent. per annum. Notes shall be made payable at a bank in the city or town in which the sale is held or at a bank in the city of Ottawa. Cash payments must be made at the time of sale in legal tender or by an accepted cheque on a chartered bank, or by a draft issued by a chartered bank, payable to the order of the Deputy Minister of the Interior. If default is made in any payment required by this section the sale shall be forfeited and void.

The purchaser must also pay the cost or the estimated cost of the survey of the berth before a license is issued.

The licensee shall pay an annual ground rent of five dollars per square mile except for lands situated to the west of Yale, in the Province of British Columbia, in which case the yearly ground rent shall be five cents per acre.

The licensee shall pay the following dues on timber cut on his berth :—

Sawn lumber, 50 cents per thousand feet, board measure.

Railway ties, eight feet long, 1½ cents each.

Railway ties, nine feet long, 1¾ cents each.

Shingle bolts, 25 cents per cord.

And 5 per cent. on the sale of all other products of the berth.

Timber Permits

Yearly permits are granted to settlers, mine operators and others on application to the Dominion Timber Agents, from whom further information can be obtained.

W. W. Cory,

Department of the Interior, Ottawa,
December 20th, 1912.

Deputy Minister.

Best Footwear For Your Work

Woodmen, construction camp workers, sawmill hands and others whose work takes them into wet places and rough going, need footwear out of the ordinary.

We have been over thirty years making special footwear for such kinds of work. This line we put on the market under the name of

PALMER'S "Moose Head Brand"

Our lines in Draw Strings and Regular Sewing represent what we have aimed at producing during our whole history in business—**the best oil-tanned waterproof footwear in the world.** We select the highest grade Chicago Packer Steer Hides and oil-tan them ourselves by a secret process that produces the finest leather in the world, known as Skowhegan leather.

Palmer's "Moose Head Brand" footwear fits better, looks better, wears better. In making them with a view to unusual wearing qualities, we have not overlooked the important points of appearance, fit and comfort.

Write for booklet "L" to-day. Free to you by return mail.

JOHN PALMER CO., Limited, Fredericton, N.B.

The Lumberman's Range

"An army moves on its stomach," said Napoleon, when emphasizing the necessity of food. Lumbering is impossible without hot food—And impossible, too, if you have constantly to be "tinkering with" your stove.

The "Driver's Joy" is a substantial wood-burning stove for hard usage—one of the many camp ranges we make. Note the sizes. Fire Box 24 in. long, 10 in. wide, 10 in. high. Top 38 in. x 28 in. Six 9-in. covers. Oven 24½ in. x 23½ in.

Send for catalog and prices.

Transmit 100% of Your Power

Why pay good money to generate power and then employ a poor belt that will only transmit a fraction of that power.

If you equip your mill with Goodhue Belts you can transmit 100% of the power generated.

Goodhue Belts stretch 15% to 25% less than other belts and have just the right amount of "cling" on the pulley.

Write us for particulars and prices

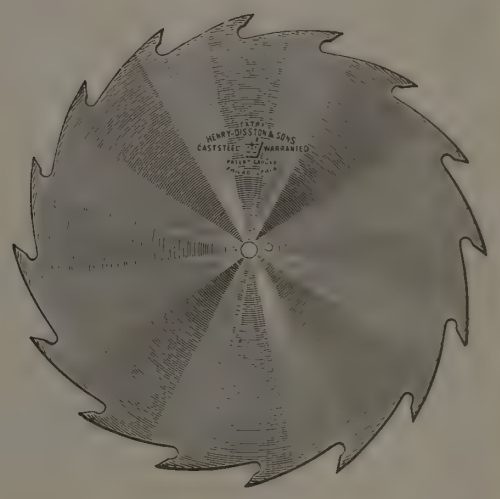
DISSTON SAWS

have been made from steel made by us in our own plant since 1855. More than sixty years experience in the manufacture of saw-steel coupled with a study of operating requirements extending over three quarters of a century have resulted in saws of highest excellence.

In tension—, set—and edge-holding qualities Disston Saws are as near perfection as the world's foremost saw-makers can make them.



Where quality means economy, the proper test is service.

The Plant behind the Truck

NATIONAL Motor Trucks are made in the largest Truck manufacturing plant in Canada. Every facility—experienced engineers, the most modern gear-cutting machines, electric welding processes, laboratories for testing materials, and rigid inspection tests—are found in this huge plant for the manufacture under ideal conditions of a truly Made-in-Canada Motor Truck.

Centrally located at Hamilton, Canada, the Company is in a position to ship complete Trucks, or parts for repairs or replacements, so as to reach almost any part of Canada within four days.

NATIONAL Motor Trucks are economical to buy and operate — and the NATIONAL guarantee is more than a "scrap of paper"—it carries an inspection service that assures the utmost return for the investment.

There are four models in the NATIONAL line, 1,500 pounds, 2,000 pounds, 4,000 pounds and 7,000 pounds.

Let the NATIONAL Traffic Engineers investigate your Haulage problems and present a report to you—personally!

A UNIQUE INSTALLATION OF

Sturtevant

INDUCED DRAFT SYSTEM

In order to lessen the danger of fire in plants burning sawdust and mill waste, the above installation was made by a Western saw mill. It also prevents the discoloration of the lumber on account of the absence of cinders.

Induced draft for twelve return tubular boilers is furnished by two Sturtevant Multivane Fans, each driven by a Sturtevant Horizontal Steam Engine. Only one unit is used at any one time, the other being held as a reserve.

The hot gases are drawn from the fan and are blown into a centrifugal separator which allows the gases to escape through a chimney at the top. Cinders drop out through the outlet at the bottom, falling into the river below.

Sturtevant mechanical draft engineers have made a thorough study of the burning of sawdust and mill waste and can give valuable advice to Superintendents. Why not investigate our proposition?

Write at once, giving full details.

WAGE WAR ON WASTE

GREAT BRITAIN DEMANDS MORE CANADIAN WOOD PULP

Every Saw Mill in Canada should have a small SODA PULP PLANT to take care of its Slats, Tops, Bottoms and "Waste" Wood. Contracts for long periods of years can be obtained.

For full information, apply

BECKER & CO., LTD.
64 Cannon Street
LONDON, E. C., ENG.

WHO HAVE IMPORTED NINETY PER CENT. OF THE CANADIAN PULP SUPPLIED TO EUROPE SINCE 1899.

FIRE BRICK

Differs in Quality and Variety

For instance, a certain quality or kind of brick that gives satisfaction when used in a Refuse Burner, may show up poorly if used in a Dutch Oven.

It all depends on getting the right kind and the right quality for your particular needs.

Just tell us what you want it for, and we'll send a firebrick that was made for that very purpose.

We Manufacture the Following Well Known Brands

"Elko," "Elk Steel," "St Marys," "Keystone" and "Rotex"

Write for a copy of our Catalog.

EST. 1880 "FACTS FIRST"

James D. Lacey & Co.

EXPERIENCE : RESOURCES : PRECISION

An Experienced Lumberman

highly skilled in all that pertains to the logging of yellow pine or hardwood, for example, may go totally astray in his estimate of quality, quantity and logging possibilities in the giant forests of California, the Northwest and British Columbia. Many have already done so.

Yet it is precisely in these giant forests that many of the very best investments in the wide world are to be found.

It is also precisely in these same forests that the facilities and knowledge of this company have reached their highest development.

If you contemplate (as you should) investments in the Coast or Northwest forests, your first step should be to get in touch with our organization.

We have a book of "Pointers" for you—please ask for it.

Canadian Made Locomotives

There is no need to go outside of the Canadian market in order to obtain the best logging locomotives. We have been specializing in this line for fifty years. You will find the design of our locomotives complete and the sturdy construction equal to every test of the severe service of logging operations.

Repair parts can always be had on the shortest notice.

This engine is 13½ ins. x 18 ins. and weighs 35 tons.

Grey Iron Castings—any size or shape—ordinary or intricate—made promptly. New foundry, splendidly equipped We would be pleased to quote on castings—singly or by contract. We also make drop forgings of all descriptions.

LOGGING LOCOMOTIVES

The designs of our Logging locomotives are the result of wide experience, extending over a period of 80 years.

The material used in their construction is thoroughly tested and is the best of its kind.

All details are accurately finished to standard gauges and are absolutely interchangeable on all locomotives of the same class and size.

This cuts out long delays at critical times of the work, as parts liable to wear can be kept on hand or shipped promptly from our works.

ATKINS

There is a distinct advantage in using **Atkins Segment Ground Cross Cut Saws.**

You will realize this fact when you try them.

By actual test we are cutting 25 per cent. more timber with least cost for refitting. Let us send you our book "C.L." Write for it to-day. ATKINS PERFECTION No. 5 and No. 69 EUREKA FALLING SAWS are the most popular Saws in Canada to-day. Send us your name for further information. Let us tell you what these Saws are doing. Then you can use your own good judgment later on.

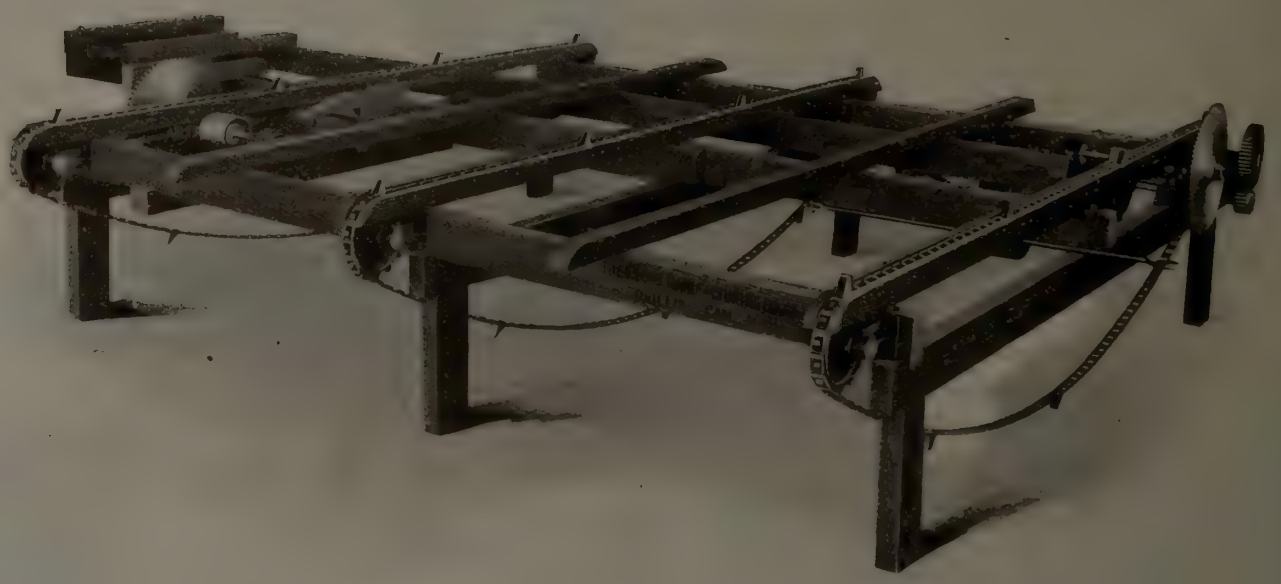
Overhauling Your Mill



When overhauling your mill get in touch with us about repairs and new parts. We give special attention to the maintenance of all kinds of saw mill machinery. Some of your equipment can doubtless be more profitably replaced than repaired. Let your new machines be "Long's".

The illustration shows our No. 2, two saw, left hand trimmer. The machine is substantially built and gives a large output with low power consumption.

Ask us for our catalogues

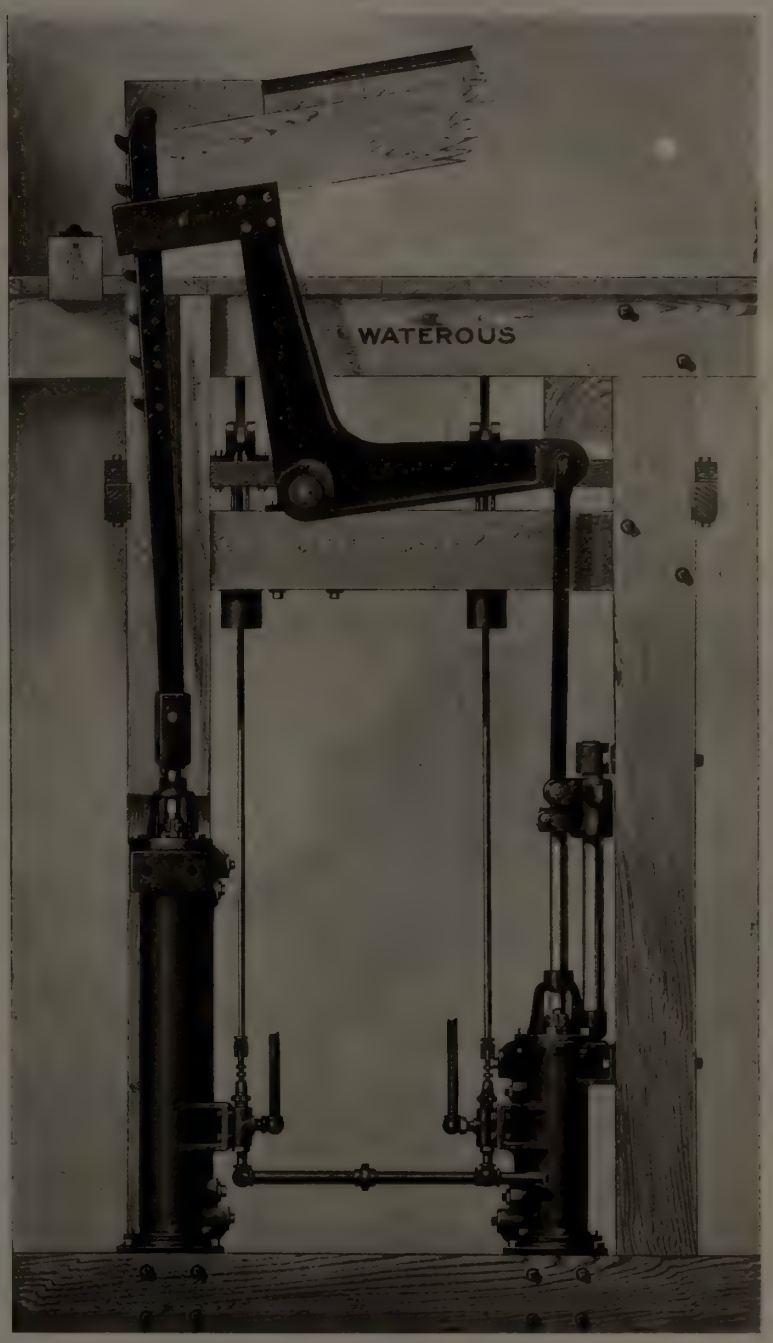
The E. Long Manufacturing Company
Limited
Orillia - Ontario

A Steam Nigger for Medium Mills

One drawback of the ordinary Steam Nigger is the fact that it requires an expert to handle it. Only a slight skip on the part of the operator is sufficient to cause disastrous results.

Where the carriage is of medium weight, unless in the hands of an experienced man, the danger of wrecking the carriage is especially great.

The **Waterous Kendall Nigger** is practically *accident-proof.* While it possesses both the speed and power of the ordinary Steam Nigger, it is so designed that a green operator can do quick and effective work without endangering the carriage in any way.



WATEROUS KENDALL NIGGER

By attaching the Nigger Bar to *one* cylinder only, one motion of the operating lever turns the log and *a quite distinct and separate motion* is required to load it.

The stroke of the cylinder controlling the loading motion is made very short and thus further precludes the possibility of a serious mishap.

The **Kendall Nigger** is constructed to be powerful and rapid in action. The cylinders are 10 in. and 8 in. in diameter, pistons are steam cushioned at both ends of stroke, valves are adjustable to permit increase or decrease of operating speed without affecting the power of the machine.

Nigger Bar is of wrought iron, dogs are extra wide, top dog is winged, a steel roller is supplied. No Floor plate is necessary. All lever and crank connections are made short and direct, so that the machine gives instant response to the movements of the sawyer's lever.

A great many of these Niggers are already in use in mills, where speed and accuracy on the log deck are essential, but where a medium weight carriage is operated. If your conditions are similar the **Waterous Kendall Nigger** will give you unequalled satisfaction. ***Ask for details and descriptive catalogue No. 123.***

OUR LOG DECK EQUIPMENT INCLUDES:

Log Loaders	Oscillating Niggers
Kickers	Cant Trips
Flippers	Board Lifters
Stationary Niggers	Log Turners

"FROST KING" METAL

$5,000,000.00
worth of mixed metal sold annually.

Our thirty-five years experience in metal mixing enables us to place on the market a babbitt that we believe to be absolutely perfect. For high speed machinery and engine work it is without an equal. It is specially designed for saw-mills, planing mills, threshing engines, traction engines, pumps, rolling mills, pulp machinery, and all classes of stationary engines. It is a high grade metal made of the very best selected stock, and carefully compounded.

If your dealer does not stock FROST KING send us a money order for your requirements. **Price 30c per lb.**, Fort William and East; West of Fort William **35c per lb.**, delivered nearest railway station; packed in 30 lb. and 60 lb. boxes.

For extra duty, such as over-hanging saws, our FAULTLESS BABBITT will stand where all other metals will fail. Price, Fort William and East, **40c per lb.**; West of Fort William, **45c**, delivered to your nearest railway station; packed in 30 lb. and 60 lb. boxes.

Morrison Lumber Measuring Register

Keep Tab On Your Stock

The Morrison Lumber Measuring Register can be used in the saw mill, planing mill, woodworking plant and retail lumber yard. It can be quickly attached to any machine and is guaranteed to accurately measure every stick as it is fed under the wheel of the register. It saves you money, time and labor.

Write for detailed information.

COSTS LESS PER DAY

AMPHIBIA BELTING

COSTS LESS PER DAY

Put Good Belting

on your

Good Machines

Your machines are expensive, and naturally you expect them to turn out the quality and quantity of work commensurate with their cost.

Then why harness them with belting which cannot begin to do them justice?

Use

"AMPHIBIA"

Planer Belting

and get the most work from your machines, in the quickest time, at the lowest cost per day of service.

Try a sample run of "AMPHIBIA" Planer and prove its merits.

"Leather like gold has no substitute."

FOR SALE: Machinery and Timber

The undersigned offer for sale, in large or small blocks all their remaining timber lands, mills and town property situated in the town of Parry Sound, Ont.

We have sold quite a number of timber parcels but still have some good bargains left in Townships of McDougall, Foley, McKellar, Monteith, Carling, Christie, Shawanaga, Burpee, McConkey, Mills, Allen, Secord, Falconbridge and Street.

Special bargains in the townships of Burpee, Falconbridge and Street for small mills.

We have the following Sawmill Machinery for sale:

1 8 ft. Double-cutting Telescope Band Mill, made by Waterous Engine Works.

1 3-block right hand steam feed carriage fitted with steam set works, made by Wm. Hamilton, Peterboro, with 10-in. steam feed cylinder.

1 Double cylinder steam nigger, right hand.

1 Log Loader for right hand mill.

1 8 ft. Double-cutting Telescope Band Mill, made by Waterous Engine Works.

1 10 in. Double-cylinder steam feed carriage, left hand, for cutting 24-ft. logs.

1 left-hand steam nigger.

1 Log-loader.

1 Endless chain jack ladder with two kickers complete for right and left hand mills.

2 Roger Gang Edgers for 8-in. cants and lumber.

1 Waterous double edger, 6 saws.

2-saw trimmers.

1 20-ft. Slash table.

1 16-ft. Revolving Slash Table.

1 Horizontal Slab Resaw with 5-ft. wheels, made by Diamond Iron Works.

1 70-ft. Transfer Chain for sorting lumber, with necessary levers, rolls and transfer chains to complete outfit.

1 Lath Mill with bolter.

2 Lath Trimming Saws.

FILING ROOM

1 Automatic Filing Machine for 12-in. D.C. band saws.

1 Automatic Grinding Machine for 8-in. S.C. band saws.

1 Hand Machine for cut-off saws.

1 Lap Grinder.

1 Set Band Saw Rollers and levelling blocks, with necessary swedges, a number of second-hand band, gang, edger and slash table saws.

POWER PLANT

2 Double Duplex, high pressure Water Pumps.

5 60-in. x 16-ft. Return Tubular Boilers, allowed 125 lbs. steam.

2 125 h.p. Water Wheels.

1 Upright Engine for sawdust conveyor.

1 10 h.p. Engine.

1 Mitts & Merrell Hog.

1 Wood Machine for 22-in. wood.

1 Edger for ripping dry lumber, installed.

1 Edger for ripping dry lumber, not installed.

1 30 h.p. Generator, 250 volt.

1 30 light arc generator.

There is also a large quantity of shafting, pulleys, hangers, belting, tram cars and turn-tables, particulars of which may be had on application.

All of the above open for inspection at Parry Sound.

The Parry Sound Lumber Co., Limited, 26 Ernest Ave. Toronto, Can.

Our Yards are Unequalled for Drying Lumber

To the Owner of Timber Lands

Far sighted owners of timber lands should take advantage of the times incident to the European wars, and prepare themselves for the day when the demand for timber is suddenly thrust upon them. This is certain to come at no distant day. Therefore cultivate a closer acquaintance with your holdings, and the best method of marketing them. Let us prepare the way for you. Remember, we not only report on the property, but assist in marketing the bond issue when necessary. Send for our booklet.

Chapleau, Ontario

The Lumberman's Range

"An army moves on its stomach," said Napoleon, when emphasizing the necessity of food. Lumbering is impossible without hot food—And impossible, too, if you have constantly to be "tinkering with" your stove.

The "Driver's Joy" is a substantial wood-burning stove for hard usage—one of the many camp ranges we make. Note the sizes. Fire Box 24 in. long, 10 in. wide, 10 in. high. Top 38 in. x 28 in. Six 9-in. covers. Oven 24½ in. x 23½ in.

Send for catalog and prices.

Not

A HOUSE

but

A HOME

is the title of our new Home Builders Book de Luxe. The cover is in six colors.

Of course you want your copy of this book. Just put it on your desk or counter where your customers can pick it up and look it over when they come in—they won't be able to resist doing so—and you'll behold the development of a new interest in home building.

In addition to supplying building hints, finishing formulas and full information regarding

ARKANSAS SOFT PINE

the book shows eight home designs ranging in price from $1,200 to $12,000. These will be invaluable to you in interesting your prospective customers up to the buying point.

The book is free. Write for your copy early as the edition is limited. Address the Bureau.

All stock bearing the Arkansas Soft Pine Trade Mark is manufactured and sold exclusively by the following companies:

How about that car of finish

Stout Lumber Company, Thornton, Ark.
Valley Lumber Company, Reader, Ark.
Wisconsin & Arkansas Lumber Company, Malvern, Ark.
Arkansas Land & Lumber Company, Malvern, Ark.
Arkansas Lumber Company, Warren, Ark.
Cotton Belt Lumber Company, Bearden, Ark.
Crossett Lumber Company, Crossett, Ark.
Eagle Lumber Company, Eagle Mills, Ark.
Edgar Lumber Company, Wesson, Ark.
Freeman-Smith Lumber Company, Millville, Ark.
Fordyce Lumber Company, Fordyce, Ark.
Gates Lumber Company, Wilmar, Ark.
Southern Lumber Company, Warren, Ark.

To secure quotations with the least delay, price inquiries should be sent direct to any of the above companies. Literature, samples and information will be supplied promptly on request, by the

Single copies 15 cents.

"The Canada Lumberman and Woodworker" is published in the interest of, and reaches regularly, persons engaged in the lumber, woodworking and allied industries in every part of Canada. It aims at giving full and timely information on all subjects touching these interests, and invites free discussion by its readers.

Advertisers will receive careful attention and liberal treatment. For manufacturing and supply firms wishing to bring their goods to the attention of owners and operators of saw and planing mills, woodworking factories, pulp mills, etc., "The Canada Lumberman and Woodworker" is undoubtedly the most direct and profitable advertising medium. Special attention is directed to the "Wanted" and "For Sale" advertisements.

Authorized by the Postmaster General for Canada, for transmission as second class matter.

Entered as second class matter July 18th, 1914, at the Postoffice at Buffalo, N. Y., under the Act of Congress of March 3, 1879.

Vol. 36 Toronto, May 1, 1916 No. 9

What Per Cent. Efficient Are You?

Something unique in the way of business study is furnished by a retailer in the Southern States who gave an address at one of the large conventions of lumbermen recently held. We have all read and heard so much about "System" that we have grown rather tired both of the word and the idea which it represents, because it has been so set up and worshiped as a fetish, often to the real neglect of other business factors that are of equal importance. The application of genuine "System" and so-called "System" to business conditions has been worked out in such wealth of detail that something in the way of revulsion is awakened by the mere mention of the word. We do not imply that the proper study of "System" as it applies to our individual business requirements is to be neglected, but that it has been overdone and that we need to be careful lest we make too much of it, to the detriment of the rest of our business details.

However, the idea we now have in mind is something new to us along this line, being a suggested method for making a detailed analysis of one's own business ability and personal equipment, and finding out to what per cent. he is efficient. As worked out in detail, this idea is presented elsewhere in the present issue, in an address delivered by Mr. R. J. Tolson, who has drawn up a fairly comprehensive list of important qualifications for a retail lumberman. These he reduces to their most elementary and easily understood forms, tabulating them under 16 heads and then leaving it with his hearers, or readers, to make their own personal applications, entering up the resulting figures and arriving at a definite conception of their own efficiency. While the writer does not set this idea forward as a practical, or scientific solution of the whole problem of analyzing business efficiency, he has furnished us with something quite valuable in the way of a means for getting at the truth about ourselves in a frank and easy manner. The idea is, in fact, applicable to all varieties of business men. A great many business men regard themselves as 100 per cent. efficient. An honest analysis along the lines suggested in this plan would probably surprise most of them.

Mr. Tolson's method may be faulty. It may not be comprehensive. It may omit consideration of some very important elements. However, it does provide a suggested plan which can be applied, with variations, to every man's individual case. The general rules laid down are quite good, and it rests only with the individual to make the necessary variations and apply the scheme to his own case honestly. He will then know, far more definitely than he ever did before, just where he stands in regard to his own business ability. Unfortunately, this scheme, laudable and interesting as it is, provides only a means by which a man may size up himself; not a means by which one man may size up another. But even at that, it is quite a timely contribution to our study of "System" and our modern tendency to make the most of ourselves, our equipment, and our activities.

One of the most interesting features of this plan is that it attaches no importance whatever to either capital or luck. Capital is extraneous to the man; has nothing whatever to do with his personal ability. Luck, if there be any such thing in the business world, is so fickle that it cannot be subjected to analysis. The efficient man usually puts himself oftenest in the way of luck, and finds it easier to make an alliance with capital. To see what your own rating is in the efficiency market, read this article by Mr. Tolson, then apply its principles honestly to your own case. It may open your eyes; it will at least do you a lot of good.

The Wide Awake Retailer—A Man of Many Parts

Much of the success of the lumber industry is undoubtedly dependent upon the manner in which the retail lumber trade is conducted. Every wholesaler, calling upon retailers, has the man whom he visits pretty definitely classified in his own mind into two general divisions, which include, in the first class, those who are alive to the possibilities of increasing their trade, and in the second class those who are more or less dead ones. We are reproducing elsewhere in this issue a portion of an address delivered recently before a lumbermen's association by Mr. J. C. Dionne, who told very forcibly how a retailer can get everything possible in the way of trade out of his district. In the first place the suggestion is definitely put forth that, in order to realize all the possibilities of his business, it is necessary for the retailer to consider his ability to serve his customers. No matter in what kind of a community a retailer carries on his trade this fact holds good. Either in a large town where there is a great deal of building in progress or in a comparatively quiet farming community the retailer's key for opening the door of success is his ability to serve—and by serving we mean today far more than we meant a few years ago. This fact is brought out very definitely by contrasting the equipment of a dealer a decade or two ago with the equipment of a modern dealer. The former carried a stock of building material and he knew a good deal about it. With his knowledge and his stock he was supposed to have acquired all that was necessary to conduct a successful retail lumber business. Today, knowledge and stock are important in their way, but they constitute only a portion of what a dealer must have if he wishes to do a successful trade.

Business does not come to a man of its own free will nowadays, as it used to do, to some extent, in the good old days of our forefathers. Getting a man's business is no longer a matter of keeping materials in stock and delivering them to him when he happens to want them. Getting business is a wonderfully complex matter today. It has its material side relating to stocks, equipment, yards, etc., its office side, relating to bookkeeping, management of employees, etc., and its psychological side relating to the creating of a demand, the foreseeing of possibilities in the way of demand, the turning of these possibilities into realities and the directing of the demand into the channels of your own trade.

None of these features of progressive trading can be neglected nowadays. They work together to produce the final result, in so intimate a manner that if one of them is neglected the efficiency of all the others is greatly impaired. Starting from the position of the old

timer with his stock and his knowledge about it, there comes next the manner in which the stock is kept. The yard can be made to bring trade just as surely as a good traveller can be trained to get orders. A yard should almost speak to the people who visit it or pass it by. It should be kept in attractive order; its fences, sheds, etc., should be neatly kept up and they should all help to illustrate the attractiveness of lumber for its various uses, by being well constructed and brightened wherever possible by the use of well selected color schemes worked out in good paint. Similar ideas apply to the office. A man or a woman entering the office ought to commence unconsciously as a result of what he or she sees, to think how nice this, that or the other material which is displayed would look in their own home, or how its use could be adapted for purposes which would help in their home decoration or improvement. The retailer's own house even should be made, so far as possible, to act as an example for his fellow citizens. No matter how humble his home may be it will be a standing advertisement, or the reverse, for the lumber yard, according to the way in which it is kept.

And talking of advertisements, the retailer has a great opportunity in connection with his trade, in his judicious use of advertising space in his local papers. There is nothing which gets quite so intimately under the skin of the ordinary citizen in a large or a small community, as the pointers and information generally, which appear in his local newspaper. The retailer is losing the service of a great salesman if he does not use advertising space of this kind scientifically. No mere mention of one's name in an advertisement will do good. The basis of good advertising is suggestion. It should be used to suggest the variety of stocks carried and their wide range of usefulness, driving the point home in every case with definite examples known to appeal directly to the people of the community in question. There is nothing quite so easy to waste as newspaper space and nothing which will bring greater results than the printed word judiciously adapted to appeal to the man who has money to spend. These ideas are strongly set forth in Mr. Dionne's article. It will repay careful study by our retail readers. We are certain that no retailer can read it without starting a useful train of thought about his business methods.

Recruiting Methods—Why Not Modernize Them?

Dean Cappon, of Queen's University, voices the sentiments of a very large percentage of the Canadian people when he says: "Let there be decent consideration for those who think they have good enough reasons not to go, at least as yet, to the war."

Possibly, if Dean Cappon spoke all that is in his mind, he would put it more strongly. Doubtless he has seen the ill-advised methods of recruiting that are being utilized from day to day by the rank and file of various battalions. Doubtless he realizes that the present system of semi-coercion has little to commend it, and, in a very large number of cases does more harm than good. Its biggest weakness, perhaps, is that it fails to discriminate between the man who holds back because he is a coward and the man who delays because his intelligence tells him that his proper place, as yet, is where he is.

The methods of recruiting as practised in Canada, if Toronto may be taken as a criterion, lack nothing so much as intelligence and good sound horse-sense. There is ample and laudable enthusiasm—but misdirected. Khaki enthusiasts fail to see, or refuse to see, that the business of the country is next in importance to the war, and as such demands fair consideration. They fail, or refuse, to see that many a young man, however desirable as a member of their unit, may be, by comparison, still more useful as a civilian in this present time of stress. They fail, or refuse, to grant to the intelligent individual the right to use his own judgment as to when is the proper time for him to give up the one and take hold of the other. In other words, the present system of recruiting is specially designed for the dilettante, the indifferent, the man lacking in moral and mental fibre; it is a reflection on the patriotism of the man who does his duty as he sees it.

All of this, and more, no doubt Dean Cappon has prominently in mind when he makes a plea for merely "decent consideration" for the men who do their own thinking. If these men had followed the line of least resistance many of them would have been in uniform months ago. Fortunate it is, as we see it, that, in the absence of the slightest apparent effort on the part of our Government to cope with this problem of filling up the ranks of the numerous battalions they have authorized, there are men strong enough to brave the jibes and insinuations of miscellaneous, misguided recruiting agents. They are simply juvenile attempts at a man's job! How can we combat efficiency except with efficiency?

The men who are strong enough to "think" to-day, men who are strong enough to resist following the lines of least resistance, cry out for some movement on the part of our Government which will enable us, as a nation, to carry on our share of this war in such a way as to conserve in the best possible manner our fighting resources—present and future. There is not a man of these who is not ready to go when and where he is told—if the authority who gives the order—**knows.** Why doesn't our Government find out? Why hasn't it an inventory of every citizen of Canada, that it could say to him, "Here is your place!"? But instead of acting, our Government delegates this authority to the illiterate private in the ranks, and, indirectly at least, authorize the man of small intelligence to badger and coerce the man who sees his duty clearly and is doing it. Why cannot our Government move in this matter?

The Retailer and the Salesman—How their Interests Coincide

In these days, when the salesman who represents a mill or a wholesale firm has more time than usual to devote to a consideration of how he stands personally with his customers, it will repay him, and the retailer also, to give the subject more than a passing thought. In fact it will be to their benefit to give the matter pretty extensive study. In the first place the relation of the salesman and the retailer is something far more intimate than that of the ordinary dealer and purchaser. In order to produce the best results, both to the retailer and to the salesman, their relationship should be of a peculiarly intimate nature. Their business interests overlap at many points. They can be mutually helpful or otherwise, just in proportion as they realize this fact.

Take the case of the retailer, for instance, and think of what he gets from the good salesman who is anxious to serve him as thoroughly as possible. He gets, in the first place, stocks of lumber. He gets also, a great deal of valuable advice about prices and available supplies, and he gets an acquaintance with the grades of lumber that are best suited for his special line of trade. Then take the salesman's case! he gets from the retailer, not only orders for stock, but knowledge about the requirements of the local and surrounding markets and valuable information about what may be required in the near future. He learns of opportunities that are continually developing for moving certain lines of stock of which his firm may have a long supply. He learns in advance of requirements that will make it profitable for his firm to buy stocks which he knows where to locate. We might enlarge this list of mutual interests almost indefinitely. It points clearly to the necessity for co-operation on a very friendly and intimate basis.

It will pay both parties therefore, to cultivate each other's friendship carefully. Business conditions today not only make this co-operation possible, but encourage it. When a salesman calls upon a retailer he only has a few calls, at the most, to make in the one town, and it will frequently happen that both parties can afford time for a friendly discussion of trade affairs, for the purpose of developing these lines of mutual assistance.

While on this subject, one of the most important factors that the salesman can bring into play comes to mind, namely, his knowledge of

grades and values, by means of which he can assist the retailer to lay in such stocks as will make his trade more profitable. He becomes, after calling upon the trade for any length of time, intimately acquainted with the requirements of the various districts, and he can give the retailer valuable advice and sell him stocks which are specially suited both to his purse and trade. Giving the retailer value for his money is something to which the salesman cannot devote too much attention. In the United States, during the past year, a factor has come into play in this connection which is of much significance, namely, trade-marking of lumber. At the bottom of this idea is the fact that a mill which is proud enough of its output to place a trade-mark upon it by which the consumer will know where it comes from, must be turning out something of superior quality which the purchaser can depend upon being maintained in future shipments.

A good line of lumber bearing a trade-mark would invariably appeal more to a retailer and to a consumer than some other line of equally high quality which does not bear any trade-mark. It is human nature to prefer an article in which the manufacturer has such confidence as to identify it with a definite mark. This plan of trade-marking lumber has not yet come into existence in Canada to any extent, if at all. But it has such advantages in its favor that we believe the success of the idea in the United States will lead to its adoption in Canada to a greater or less extent in the near future. After all, the man whom it is more important to please than all others is the one who is going to use the lumber, and the surest way of pleasing him is to sell him a line which serves his purpose well and which he can depend upon obtaining again when he needs a new supply. Even without a trade-mark it has always been in exact proportion to the certainty with which a salesman can guarantee his goods and furnish repeat shipments of equal quality, that his business has flourished. In other words the man who can deliver just what the purchaser desires, both now and in the future is the one who will get and keep his trade, and in reaching this conclusion we come back to the fact which we put forward in starting this article; that the surest way to enlist the sympathy of a retailer is to get at his personal side, by talking over trade with him and endeavoring to make him, not only a customer, but a personal and intimate trade acquaintance, who will buy your goods and co-operate with you in the exchange of useful information about the many important interests which you both have in common. Co-operation means increased trade for both parties.

Creosoted Blocks the Ideal Pavement

The only complaint against creosote blocks for wood paving has been overcome, it is reported, through a process developed at the Forest Products Laboratory maintained by the United States Government at Madison, Wis. The opponents of wood paving have used in their arguments the fact that with certain conditions of treatment the pavement is liable to "bleed" during hot weather. By this term is meant that the oil oozes from the blocks and forms a black, sticky mass over the entire street. This is of course annoying to residents along such streets and the Forest Products Laboratory has been investigating the problem with a view to preventing "bleeding." A process has been perfected whereby blocks treated with creosote and exposed to the direct rays of the sun on some of the warmest days or even when placed in an oven where a temperature of 212 degrees Fahrenheit is maintained, remain perfectly dry. It is expected that this process will be adopted generally.

Creosoted wood blocks, already extensively used as paving material for city streets, have been coming into use as flooring for the last four or five years, according to the Forest Service. Its durability, noiselessness under heavy traffic, and sanitary properties are its chief advantages for paving and also give it special value for making floors, especially for use where heavy trucking, the moving of heavy machinery, or other severe use makes the maintenance of floors a serious problem. Its rather high cost is its chief disadvantage.

Wood block is now widely used for flooring in factories, warehouses, machine shops, foundries, various types of platforms, wharves and docks, and for such miscellaneous purposes as hotel kitchens, hospitals, laundries, and slaughter houses. Possibly one of the oddest of these uses is for the floors of wild animal cages and runways. Notwithstanding the recent increase in the use of wood block for these purposes, it is believed that the growth of this industry will be even more rapid in the future. These floors are well liked by the workmen because they are easy on the feet.

Most of the blocks for these floors are now made of southern yellow pine. Hemlock, larch, Douglas fir, black gum, beech and maple are also used. The blocks are sawed from long sticks of timber and are treated in huge steel cylinders from 6 to 7 feet in diameter and 100 feet or more in length. Creosote oil is run into the cylinders and pressure is then applied to force it into the wood. The oil is a product obtained in the manufactuer of coke from coal and its purpose is to prevent decay of the wood, and also to prevent shrinking and swelling of the floor after it is laid.

The blocks are laid with the grain vertical, so that the most wear-resistant surface is exposed, and usually on a concrete foundation. The joints or cracks between the blocks are then filled with hot paving pitch or asphalt which binds the many separate pieces into one continuous surface. According to the experts, the cost of creosoted wood-block floors averages about $1.50 per square yard for the blocks alone and about $2.40 per square yard for the completed floor.

For best results these floors should be laid under competent supervision, for unless certain fundamental rules are followed trouble is very liable to ensue. Most of the trouble is caused by the swelling or the shrinking of the wood, due to changes in content of moisture, difficulties which may be guarded against, however, by carefully following the most approved methods.

A war against currants and gooseberries where they are found in the vicinity of white pine, has been declared by forestry and agricultural experts. These bushes have been found to be the most vulnerable point of attack of the latest tree disease, the white pine blister rust, which has been imported to America from Europe, where it has made the growing of white pine impossible. The United States Senate has already taken up the problem of this plague, with the introduction by Senator Gallinger of a bill giving the Secretary of Agriculture funds and authority to combat this disease. This disease, first found within the last few years, is certain to become a most dangerous tree disease unless steps are quickly taken to control it, and the peculiar nature of the disease is in its being spread by the currant and gooseberry. The disease cannot spread from one pine to another, but can spread from a pine to currant or gooseberry bushes, and from them back to the pines, which it will kill, even when the trees are thirty years old. The disease was imported to this country on nursery stock of white pine, and plantations from such stock in the states of New York, Pennsylvania, New Hampshire, Vermont, Massachusetts and Connecticut have been found to be infected. Plantations in other states have been found to be infected. The governmental authorities declare that where this disease is found, the safe thing to do is to kill all infected pines, and all currant or gooseberry bushes in the vicinity. The disease attacks several varieties of white pine, including the sugar pine of the Pacific coast. The federal government is asked to make an appropriation of $50,000 for the fight against the pest. Massachusetts has asked its legislature for $10,000 for the war against the blight, and other states where the plantations are already infected are to be asked to aid in the fight.

A pamphlet has been issued describing the course in lumbering which is being given at Harvard University for the purpose of training men for the lumber business. The course is offered by the Harvard School of Business Administration in co-operation with the Department of Forestry. The pamphlet describes the various courses of instruction which relate directly to lumbering. An indication is also given of the extensive attention that is given to business subjects. The course is a very thorough one and will be of great advantage to young men who intend to go into the lumber business in any of its forms.

Lieut. Jas. M. Cane Wounded

Lieut. Jas. M. Cane

Lieut. Jas. M. Cane, son of Mr. J. G. Cane, the well known Toronto wholesale lumber dealer was reported wounded recently in France. Word to this effect was received by Mr. Cane, 97 Delaware Avenue, Toronto, on April 13th. Lieut. James M. Cane was for a time engaged in journalistic work in Toronto before leaving for the Front. Besides having occupied positions with important Toronto daily newspapers, he was at one time an assistant on the staff of the Canada Lumberman, and was well known in this capacity to the lumber trade in Toronto. It is now over a year since Lieut. Cane enlisted with the 4th Canadian Mounted Rifles. He was transferred to the 37th Battalion and went to England last November. For some time he was stationed at Shorncliffe camp as infantry instructor, but about five or six weeks ago was sent to France with a draft of officers from the base.

The last letter his father received from him was written some eight weeks ago and stated that he expected to be sent to France. Mr. Cane has received no further word regarding his son's injuries, but is hoping to receive a communication soon. A brother of Lieut. Cane, Pte. Chas. M. Cane is in France with the 58th Battalion, having enlisted over a year ago and having been sent to France from England in the early part of March.

Equipment of the Forestry Battalion

When the 224th Overseas Battalion paraded recently in Ottawa, for inspection by his Royal Highness the Governor-General, the equipment carried by the members of the battalion created considerable discussion among lumbermen in Ottawa and elsewhere. We have heard several lumbermen discussing this matter and in order to explain the affair we have made enquiry of the Officer Commanding. It will be recalled that, upon that occasion, the Forestry Battalion paraded with various implements, among which were broad-axes. As broad-axes are used for squaring timber, and as the Forestry Battalion will probably be employed chiefly in the felling of timber and have little or no squaring to do, there was some criticism about this equipment, a few lumbermen going so far as to intimate that the carrying of broad-axes laid the battalion open to ridicule.

The Officer Commanding, referring to this subject, says:—"Your information as to part of the implements which our battalion carried during this parade in quite correct, but they carried also peavies, camp-dogs, cross-cut saws, etc. This parade was not intended to show what implements they should carry, but merely for inspection by his Royal Highness the Governor-General. Our equipment altogether will be that used in the lumber industry in Canada and therefore, this parade cannot be taken as affording any example of the equipment we will carry abroad."

The 224th Forestry Battalion has made quite a record in recruiting, having, in about one month secured some 1,800 men.

Broken Boom Creates Excitement at Ottawa

A large boom of logs near Lemieux Island on the Ottawa River, which broke loose recently, caused much excitement when they reached the Chaudiere Falls at Ottawa. The falls took on quite an old time appearance when over 2,000 of these logs came rushing down the river. A dam would form below the Chaudiere Bridge and this would be broken as a fresh lot of logs would strike down. The real danger, however, was above the falls at the new dam, where the logs, in getting through the narrow sluices, would pile up in dangerous fashion. Only skilful and prompt work on the part of the men in charge of the dam prevented the logs from forming a dam right across the falls which would have resulted in flooding some of the E. B. Eddy mills. The logs are owned by J. R. Booth and the Shepard & Morse Lumber Company. A somewhat similar occurrence took place about the same time on the Gatineau River where some thousands of logs boomed at the Cascades broke adrift and swept down the river piling up in a jam nearly 50 feet high at the government boom at Gatineau point. A gang of men were put to work upon the boom and managed to strengthen it so that it held until the water receded from its high level and the danger was past.

Captain W. B. Bartram Joins 80th Battalion

Captain W. B. Bartram.

Captain W. B. Bartram, president and manager of Bartram Bros. Ltd., Ottawa, and director and sales agent of the Devon Lumber Company Ltd., Ottawa, has accepted an appointment as Captain in the 80th Overseas Battalion, C. E. F. which has its headquarters at Belleville, Ont. It is expected that the Battalion will be leaving for Overseas in the very near future. Captain Bartram is well known to the lumber trade in Eastern Canada and in the United States. He has been identified continuously for 25 years with the lumber business, having worked through all its branches in the woods, sawmill and planing mill, and made a special study of conditions in connection with the export trade. Under his management the business of Bartram Bros. Ltd., has grown rapidly until it is one of the most important in Eastern Canada, covering all the important centres of Quebec, Ontario, and the Eastern States.

During Captain Bartram's absence the business will be carried on by Mr. Colin M. Bartram and Mr. E. M. Ball, both able and experienced lumbermen.

Details of Port Nelson Timber Shipments

The quantities and varieties of timber, and their prices, which have been used in connection with Port Nelson Harbor works by the Dominion Government were reported in the House of Commons recently by Hon. Mr. Reid, in reply to a question. In connection with the Port Nelson works 4,391,619 feet B. M. of long leaf yellow pine wharf and heavy crib timber have been purchased from the United States, also 168,018 feet B. M. of oak, hard pine and Oregon pine for clam shell dredge hulls and spuds, nearly all of which was dressed timber. The cost of the above was $109,395.80. The amount which has already actually been put into the Port Nelson works is as follows:—long leaf pine 1,447,619 feet B. M. The quantity in stock at Port Nelson is 2,163,000 feet. 761,000 feet B. M. was lost in a fire on the steamship Alette, 20,000 feet B. M. was lost from a deck load in transit. There has also been used for clam shell dredge hulls the full amount of oak, etc., mentioned above. The portions of this timber purchased in Toronto were secured through representatives of B. C. lumber companies amounted to 1,245,160 feet B. M. of B. C. fir wharf and crib timber, and 75,691 feet B. M. of B. C. fir in select dressed scow timber. This stock was transported by steamer after the opening of the Panama Canal. The Toronto orders also included 4 octagonal pieces 29 in. x 29 in. x 72 ft. long, dredge spuds; one piece 16 in. x 16 in. by 76 ft. long, dredge spuds; one piece 14 in. x 14 in. x 84 ft. long, derrick boom.

In addition to the above Toronto orders, about 4,250,000 feet B. M. of other Canadian native timber was purchased for building construction, interior of cribs and other purposes for which it was suitable.

In reply to a question as to the total cost of timber landed at Port Nelson the Minister said that separate costs for each commodity had not been kept. In general, the average cost of transporting freight of all kinds to Port Nelson was $56.65 per ton in 1913, $13.59 per ton in 1914 and $9.62 per ton in 1915. The direct lightering charge at Port Nelson was $2.75 per ton in 1914 and $2.50 per ton in 1915.

Pitprops for the United Kingdom

An inquiry has been addressed to the Department of Trade and Commerce, Ottawa, from a British house of timber importers desiring to get into touch with parties in Canada in a position to supply pitprops. This firm, who have been large importers into all the principal ports in the United Kingdom for the last fifty years, have hitherto been getting their supplies from the Baltic but owing to the cutting off of the customary sources of supply due to the war, a portion of their orders has been filled in Newfoundland. It is stated that, provided prices were right, almost unlimited quantities could be taken every year, full cargoes at a time. The name and address of the firm making the inquiry may be obtained on application to the Department of Trade and Commerce, Ottawa. (Refer File No. A-976.)

Loggers' Rights on Ontario Rivers

Important Judgment in a Case Involving Regulation of Flow by Construction of a Dam

An important and interesting judgment regarding the rights of loggers upon rivers and streams in Ontario was delivered recently by Chancellor Sir John Boyd in the case of Hunt v. Beck. The defendants in this case had acquired timber rights from the Crown by the purchase of limits in an unsurveyed territory owned by the Crown, in which were found the Western sources of the Thessalon river, a floatable stream. They began operations in 1913, and constructed a series of dams upon that river, which were essential for taking away their timber. The plaintiffs had no particular status upon the river, but during the season of 1914 were driving logs down it from a tributary of the river which joins it below the confluencee of its two branches, and about 15 miles below the defendants' operations on the western branch of the river. The plaintiffs complained that the defendants had deprived them of water sufficient for the purpose of floating their logs in the river.

The case before Chancellor Sir John Boyd was an appeal from the report of the local judge who found in favor of the plaintiffs upon their claim to recover from the defendants damages for wrongfully depriving the plaintiffs of water sufficient to float their logs down the Thessalon river; as well as a motion by the defendants for judgment on their counterclaim.

Chancellor Sir John Boyd held that as to the flotation of logs in the river, the plaintiffs and defendants had equal rights under the Rivers and Streams Act, but that as to the user of the water above where the defendants had made improvements, they had preferential rights as statutory licenses. "They were the first and the only occupants of these head waters of the Thessalon river, and as to their various works to facilitate the driving of logs to the market they were statutory licensees. The statutory license, implemented by the erection of works, did by necessary implication give them superior rights in regard to the use and control of these improvements, as between them and the plaintiffs operating on the river at Wood's creek. As a matter of natural justice, the timber licensee who had the right to further his operations by the construction of dams, etc., had also the right to put them to the most beneficial and profitable use for his own undertaking primarily, and was not called on, to his own prejudice, to make his reserves of water subservient to the needs of a lower operator. If any detriment arises from the proper and reasonable use of the dams to facilitate the transmission of the defendants' logs (and nothing to the contrary of this is proved), then the plaintiffs have to submit to the disadvantage as a necessary consequence of their position. This water so stored was essential to the defendants' use; were they to suffer by its release that the plaintiffs might benefit thereby? Briefly, there has been no diversion or diminution of the water, no interference with the natural, ordinary flow of the stream; and the rightful retention of the water by the defendants cannot be turned into an illegal detention from the plaintiffs.

"After carefully reading and considering the voluminous evidence, I am compelled to the conclusion that in all aspects of the case, whether of fact or of law, the plaintiffs have not established a claim for damages. The judgment given in the primary court is to be reversed, and the action stands dismissed with costs. The amount agreed upon as to the defendants' counterclaim should be paid by the plaintiffs—with without costs."

Embargo Problems Drive Shippers to Extremes

As showing the shifts to which consumers of lumber are at times driven with the railroads maintaining an embargo upon many commodities at certain points, due to a car shortage and the need of a better system of per diem charge, it is stated that the Brandywine box factory of the Du Pont Powder Company, at Carney's Point, New Jersey, several days ago arranged for the shipment by express of not less than ten carloads of lumber to be used for making boxes in which exports of powder are made. Because of the embargo it became necessary to adopt some means other than the regular one of securing the lumber for the boxes in time, and the express idea was adopted. The shipment is said to have cost not less than $6,000, and to have come from Maine. At the present time the box factory is being called on to supply some 8,000 air and moisture-proof boxes, about the size of a steamer trunk, daily, to meet the demand of the powder company. Into these wooden boxes are fitted metal cases of zinc, containing the powder. The box factory is required to work night and day without stopping to keep up with the needs of the powder works, some 800,000 pounds of powder being turned out there every 24 hours.

Good driving conditions are reported upon the Nashwaak River, N. B.

Should We Stop Recruiting in Ontario?

To the Britisher, to the Canadian, there is something repulsive about the word "conscription." Voluntary service has been so long recognized throughout the British Empire as the ideal form of military law that we do not take kindly to the thought of being compelled to shoulder arms. But in the face of what is happening in Canada, if we look right at the facts we cannot but feel that there is much to be said in favor of conscription.

What is the situation in Ontario? Recruiting has been carried on to such an extent and in such a haphazard manner that our industries are crippled, production is at low ebb, labor for the factory is unobtainable, and contracts which rightly belong to us are going to the United States. Ontario is suffering as the result of her activity in recruiting, a statement which cannot be made of certain other provinces of the Dominion. Conscription would remedy this inequality.

This war is a business and should be conducted in a businesslike way. Have we not recruited beyond the requirements? If we have not, why are battalions which were in camp at Niagara last year preparing to return there this summer? The time necessary to train a soldier is surely not a satisfactory answer—and all the time our industries crying for men.

Sir Robert Borden offered to send 500,000 men if required, but it would seem that the Minister of Militia's call for the second 250,000 has not yet been justified.

If we are recruiting more men than are required, it means a loss to the country and to the Empire. Every man's time should, in this crisis, be employed where it will be most effective.

The scarcity of labor is serious. The suggestion has been made that women take the place of men in the banks and offices and other business places, and that the men thus replaced who do not join the colors go to the farms. Yet in the face of this situation we find the Government appropriating $100,000 for a campaign in the daily newspapers to encourage increased production and thrift on the farm, where the supply of labor is already totally inadequate. There are grave economic problems before us. Can they be satisfactorily worked out under the present system of recruiting? What are the opinions of our readers?

St. John River Logs Well in Hand

A jam of logs which formed at Grand Falls an the St. John River, N. B., broke on April 17th and the logs commenced to run freely. It was then feared that the St. John River Log Driving Company would not be able to have their booms at Fredericton swung in time to catch the logs coming down the river. Special efforts, however, were made, and the Mitchell boom was closed on the morning of April 19th, thus sealing the river and catching the logs. The Sugar Island boom was closed the same afternon. Lumbermen estimate that the jam at Grand Falls contained about 1,500,000 feet.

Reports received from Fredericton, N. B., under date of April 22nd state that all the drives on the Upper St. John River had then started, and water conditions were favorable. About 50 million feet will be driven from the Upper St. John this season for the boom at Fredericton. John A. Morrison, Fredericton, will drive about 12 million feet this season. W. J. Noble will drive about 7 million feet. J. Kilburn has about 6 million feet of old logs to come out. The first bank logs arrived at Springhill on April 21. They were for Fraser Ltd., having been contracted for previously. Present indications are that the price of bank logs this year will be as high as last year, if not somewhat higher.

The Partington Company's drives on the Nashwaak River and the Nappadoggan started on April 17th. Between 12 million and 15 million feet will be driven on these streams this season.

On the Oromocto River the drives came along rapidly and were all out about April 17th. About 6 million feet will be driven on the Oromocto and other streams in Sunbury County this season.

Drivers are being paid higher wages than a year ago, owing to the scarcity of men. Last season the wages ranged from $2.25 to $2.50. This year the men are receiving from $2.50 to $3 per day, and in some cases even more.

Infomation which we received from private sources on the Miramichi River in New Brunswick about the 22nd of April was to the effect that the outlook for stream driving operations was not very encouraging at that time.

Three Quebec lumber contractors from the eastern townships were recently found guilty, at Concord, N. H., in the Federal Court, of violating the Alien Contract Labor Law by taking men from Canada to the State of New Hampshire to work in lumber camps there. One man was fined $100 and costs, the second man $1,000 and costs and the third man $500 and costs. Twenty-two other Canadians who had been detained as witnesses were ordered to be deported.

Direct Results from the Retail Yard

Stocks Disposed of by Bright Advertising, Backed up by Energetic Sales Work

By H. J. Cooke

You all remember how business was, or rather wasn't, in the spring of 1915. Everyone was very much more interested in the war, and when it was going to end, than they were in building; no one seemed to have any money and the lumber business absolutely ceased. Our company had a lot of perfectly good lumber yards, well managed, and the only criticism we had of them was that they were not selling anything, and when business dropped off with us to a point where we were confronted with the proposition of either selling lumber or turning our yards over to the local cemetery associations for burial, we decided to try the startling and revolutionary idea of spending more money for advertising. In other words, go on the novel theory that a lumber yard was a mercantile establishment, and what was good for the dry goods, grocery, automobile and even the saloon business couldn't hurt a lumber yard very much. So as an experiment at two of our most defunct points we put in a complete stock of serviceable but low priced lumber, and then commenced to write ads. This was something new to us. Don't misunderstand me—we thought we had written advertisements before—lots of them. They usually consisted of a space about three inches high and four wide, containing such classic and standard phrases as "Let us figure your bill," "Headquarters for all kinds of building material," "Best lumber for least money," and the rest of the phrases that precedent had taught us were the real and regular stuff in lumber yards advertising and that anything else was socialistic. Then, too, I was once in the wholesale business and advertised then. When they asked for the copy we wanted run, I just gave them a letter head and told them to run that; consequently we advertised very extensively who the officers of the company were, our capitalization, and a lot of other facts of no interest in the world to anyone but ourselves. I mention all these things to show that we knew a lot about advertising, but this time we changed our methods somewhat, and instead of seeing how small a space we could get out on, we endeavored to get as much space as we could and still leave the editor room for letters from his country correspondents. We took pages and half pages and told people in big black-faced type an inch high that could be read across the street that we had certain items of lumber which we would sell them at certain prices, and suggested in these advertisements uses to which this material could be put. In other words, we were trying for a chance, merchandizing instead of "running a lumber yard." And I verily believe that if we hadn't done this advertising at our yards at that time we would not have sold enough to pay salaries, as nearly 90 per cent. of the goods we sold were the heavily advertised items. We have introduced this heavy advertising at all our yards, and it has shown us results at every point right from the jump; not weeks after or months after, but as soon as the papers containing the ads were out. I am not going to give you a lot of dry figures as to what advertising has done at certain yards, because statistics are very uninteresting things, and then, too, that would be telling; but when I say that some of our yards have shown an increase in sales of as much as $20,000 a year from $600 per year spent in advertising, and have shown profits in line with the increased sales, I believe I am saying something that is interesting, and that we got results. It is about the most fascinating business proposition I ever had anything to do with to advertise certain items of lumber, say, on Monday, and on Tuesday see on your sales sheets where they are hauling those advertised items out of the yard. I believe that one reason why this advertising has been so effective is that it has been a step in the direction—just a short step—of dispelling somewhat the cloud of mystery which to the average consumer surrounds the purchase of a bill of lumber, because it offers him a definite article at a definite price. A banker and merchant, a man of affairs in a small town, told me a few weeks ago that he never had bought a bill of lumber in his life that he didn't feel he had been skinned in the transaction somewhere because he couldn't check up the deal. A farmer drives in your yard and tells you he wants 12 pieces of 1x12—16 boxing, 12 pieces OG batterns, eight scantling 20 feet, five pieces lathing 12 feet, and about 15 pounds of nails. You ask him what grade he wants (instead of finding out for what purpose he wants the stuff and then you telling him what he ought to have). You load his wagon; he asks you how much it is. You say, "Wait a minute; I've got to figure this." Then you get a big piece of paper, and pencil and to him make a lot of mysterious figures for awhile then go back over the figures and finally tell him he owes you $12.80. As he is paying the money, Mr. Customer wants to show some interest in the trade so he asks what you charged him for the boxing and you say $32.50 per thousand. He doesn't realize or think that he only got 192 feet of boxing that cost him $6.25, but that $32.50 a thouasnd sticks in his mind and he tells you how he remembers when he was a boy that "Paw got better lumber than that at the mills for $12, and that lumber sure is higher." The only part of it he remembers is that thirty-two fifty and when his neighbor comes over to see what he is building, he asks "What did you have to pay for that lumber?" he tells him $32.50, and friend Neighbor thinks to himself, "I can't afford to do any building; lumber is too high." The 15 pounds of nails is the only item where he is sure he got what he paid for, as he saw you put 15 pounds on the scales and he can figure that 15 pounds of nails at a nickle a pound is 75 cents. Wouldn't the average lumberman feel rather confused if he went in to buy a couple of collars and on asking the price was told that collars were $18 per gross? He would have to figure what part of a gross he bought or else trust that the clerk was figuring correctly. It's much more simple to be told they are two for a quarter, and I believe that some day lumber is going to be sold by the piece, and when a man comes in your place of business and wants a price on 1x12—16 you will tell him 52 cents each, and if he puts ten on his wagon, he knows as well as you do that he owes you $5.20. Here is a price list gotten out by a very active lumber mail order house. Do they say this lumber will cost so much per thousand? No, you bet they don't. They say that a 2x4—18 No. 1 will cost 34 cents each, a number two 31 cents, and 6x6—12 96 cents each, and so on right down the line. And when the consumer sees those prices he feels more at home because he knows he can check the transaction as well as the man he is buying from.

But to get back to my subject: Retail lumber yard advertising to get results should be based on the theory that there are on deposit in the banks thousands of idle dollars and the advertising if properly handled will put a lot of them into improvements. A man living on the eighth floor of a steam heated apartment house in the city doubtless has very little use for lumber, but did you ever drive out to a friend's house on Sunday afternoon, and when he was showing you his garden, or his Rhode Island Reds that he didn't finally start in and tell you where he was going to build a sleeping porch, or an ell on his house and show you where he was going to bring it to? Every man who owns a home has these building ideas in his mind. Indefinite perhaps, but there, and when that man is confronted all the time with lumber and building material advertisements he is going to decide finally to have that work done, and advertising should have just that idea in mind.

A great many of you gentlemen, mostly the manufacturers, have automobiles. Do you think you would have bought your car if the automobile people had waited until you found you had to have one and then courteously waited until you got good and ready and asked each dealer for a bid, and then bought it where it was cheapest? Yet that is the way lumber is sold. How many houses in your town have been built as a result of salesmanship or where the lumber dealer had anything to do with encouraging the owner to build it? Alone in his solitude the prospective builder is allowed to ponder on his ideas, no lumber salesman being impolite enough to hurry him, until finally he decides that it is no use waiting any longer, that his family has outgrown the old place and a new one is necessary. I sometimes wonder where the lumber business would be without nature. Nature grows the trees from which lumber is made and then increases families so that there is a demand for it in the finished state. I know that demand can be created for lumber, because a man who bought several tenant houses from us told me that he would have built them sooner, but he thought lumber too high until he read our advertisements. One man came to our yard and took a load of advertised flooring and stored it under the house until he could use it for fear the bargain would get away from him. Right around the first of the year, when we were busy with inventories and statements, we did not give our advertising the attention it should have had and our business slipped off. We started the campaign again with renewed vigor and almost instantly we could see increased sales. Really, it looks like some kind of magic, and another thing—it is not your competitor's business you are taking, but business you have procured. Any advertising that has as its motive the taking of business from your competitor is, in my opinion, money thrown away.

In conclusion I want to say that I know from experience that the lumberman who is willing to invest a few hundred dollars in printer's ink in any kind of well thought out advertising, shove out his money and take a chance on the returns, who doesn't expect to harvest his crop until he has planted it, and hoed it, or in other words get results before he invests; who will give advertising the same consideration as he does other vital parts of his business, as the mail order houses do,

and will then back up his advertising to the letter with the goods and the service, and use reasonable business judgment, cannot help but increase his sales and his profits, be a factor in improving the community in which he lives, and make a success out of his business. He may accomplish all these things without advertising, but every dollar he spends for advertising can be considered as just so much money paid out as insurance that he will.

Buying Special Order Millwork

Once I furnished the millwork for a nice little residence that was being built without any scale drawings, from a rough sketch which the owner had made on letter paper. The prospective residents wanted plenty of light in their home and the sketch indicated the wrong proportions of wall space. After the building was under roof they discovered that there was no place to set the piano except in front of a window. That would not do at all, so they decided to close up the window. The house was of hollow tile construction and the total cost of that alteration would have more than paid for a good set of plans. The stairs on this job were left to the skill of the carpenter, and he built them on the cut and try system, by guess, etc. The result was a flight of stairs that was not at all bad, but the way that carpenter did cut and slash that nice oak finish at $100 a thousand would make any millwork salesman smile in his sleep. And the length of time he took to do it was doubtless a fine thing for him, but where did the poor owner get off? It is quite possible that he would take the position that he had his house the way he wanted it, and that in building he had not been tied up to any set of plans that had to be followed. But has he got it the way he wants it? He has not. He has it the way the carpenter wanted it. He may "kid himself along" with the idea that it suits him, but the fact is that he has a house that was built for a carpenter with no family and a very commonplace idea of artistic design.

Some people have an idea that plans present some terrible difficulties, and are only meant for the use of mechanics and other persons directly connected with the work which they represent, and that outsiders are better off if they leave them alone. Just why this is so I have never been able to understand, unless it is that certain architects and others connected with the building industry have the idea that it is better for their business to keep their clients in ignorance. As a matter of fact plans are only pictures drawn without perspective and in exact proportions, and details are only larger pictures of parts of plans. Specifications are descriptions of, and directions for, the construction that can not be indicated on the drawings. If a man is too foolish to be able to know after a careful study of a set of plans whether or not be able to know after a careful study ofa set of plans whether or not the completed house is going to suit him, he does not need a house anyway, and if he does the State will probably provide it.

The usual reason for not using plans in building is the expense, but if you or your customers could know of the hundreds of real cases similar to the one cited that have come under my observation you would know better. I do not believe any man ever saved a dollar in building by not having and following a good set of plans. I will admit that there are poor plans that are worse than nothing, and that good plans not followed are likely to prove a nuisance, but these things should go without saying. Nothing that is poor is economical, and any good thing can be abused.

I am not all for the architects either, but there are so many "dub" architects puttering around that the uninitiated public is frequently deceived. Some of these "dubs" get large contracts and are able to "point with pride" to their accomplishments. A certain government building that I know cost $5,000,000 and reminds the average observer of a rough-neck washerwoman in a new calico dress, but I would rather "point with pride," if I could, at the staircase in the old library down on Randolph Street in Chicago than at that gay washerwoman Government building. I know where there is a millionaire's country home designed by an architect of national reputation, that has an imported, hand carved, Venetian marble mantel of exquisite design and workmanship, costing a small fortune, planted right down in a great living room of massive colonial architecture, with beamed ceiling, heavy cap trim and heavy pilaster casings, all of California redwood, rough finish. What do you know about that? The mantel is a dream, and the colonial trim is all right, in its way, but I can not just grasp that architect's idea of harmony. On this same job the two inch thick pilaster casings make it impossible to open any door wider than straight out into the room. Perhaps that architect deserves his reputation. I do not know. I leave it to you.

To employ a really good architect would be a privilege, and were I able to do that when I build I would just tell him how much to spend and then I would go off to Europe and stay a year, and then come back and move in.

But all that requires more of those hard iron men than most of us have, and we lumber dealers build more common, little, modest homes than we do of mansions, and under those circumstances the best way for a builder to do is to get from the local dealer one of those books of designs which all live wire dealers have for free distribution, and to study it carefully till a selection can be made. The plans which accompany these books are usually along fairly good architectural lines and many of them are as good as any one would want. One of the finest homes I have ever been in was built from plans selected from one of these books and specifications filled in by the lumber dealer on stereotyped blanks. In truth, many of the designs given are copies of houses actually built and in use, so that there is no guesswork about the correctness of the drawings or the appearance of the buildings when completed. There are so many different systems of this kind for the dealer to select from that there is really no excuse for being without at least one, and more would be better according to the extent of his business. Some dealers charge for the plans and make a profit on them. Some prefer to use them as an advertising stunt and present the plans as an inducement to buying the material. These things must be worked out according to local conditions and to the ideas of the dealer.

There are several methods of buying plan-work, differing according to the ability and the aggressiveness of the dealer. The best way but doubtless the one requiring the most work is for the buyer to take from the plans a list of the material he wants to buy and submit several copies to millwork houses for estimate. In making up these lists he should omit such items as he has in stock and should accompany each list with details and descriptions complete enough to give a thorough understanding of what is wanted. If there are any items which can be changed to conform to the stock of the house to which the inquiry goes, such possibilities should be noted so that each list will be particularly suited to the firm to which it is sent. This would of course make the lists differ somewhat from each other but when the material is finally received there will not be difference enough to amount to anything and the saving in dollars and cents will more than pay for the extra work.

The other way, and by far the most popular, is to send the plans to a millwork house and let the man there do the work. In this case the wholesale estimator either makes up a blanket bid covering the general items he wishes to furnish, or he makes a detailed list which is more or less complete and which is the extent of his responsibility at the price named. When blanket bids are made the estimator usually adds 10 or 15 percent to cover omissions and errors, and in the case of detailed lists it is very necessary for the buyers to check same very carefully to be sure that everything is included. In either case the number of estimates that can be obtained is evidently limited to the number of plans that are available and it is hardly possible for the dealer to omit material that he has in stock. Mistakes and misunderstandings occur that are hard to erase, and the dealer gets disgusted with the millwork end of his business and is indifferent when the mail-order houses begin to work inroads in his trade. Sending plans away for estimate is certainly the easiest way to handle plan-work but it is far the most expensive and quite likely to be unsatisfactory. There may be large and particular jobs where it might possibly seem to be the best way on account of the necessity of following the details closely, but even at that, details are easily traced and specifications are easily copied, so that in my experience I have never found a case where I did not think it worth while to make my own lists.

One thing I must suggest in connection with the above is that while plans are undoubtedly made to be followed and severe changes in them tend to destroy much of their usefulness, yet slight changes in details to allow the use of stock designs of moldings, etc. can not work any harm whatever to the owner and may possibly give him the greater value than to conform absolutely to the details as indicated by the architect. For example, I have been required to figure special veneered doors on account of a certain little quirk or cove in the sticking which if changed by the merest trifle would have permitted the use of a stock door. And seasoned stock doors are always better than special order doors that have not been in existence long enough for any one to know what they are going to do when hung. Oh, I know that idea is directly contrary to what most of you have fondly believed for years, and that most architects and contractors pass out the idea that a veneered door must be made to order to be any good, but if you think about it reasonably a little you will know better.

We all have our ideas about architects and we also know that the profession includes the good, bad and indifferent. Many of our old stock designs are patterned after the Greek and Roman styles of architecture and if properly and consistently used are as suitable today as they ever were. The condemning by architects of stock moldings, cap trim, collonades, door sticking, etc., just because they are stock designs, should be discouraged as well as the indiscriminate jumbling together of various styles of architecture by others.

In concluding let me drive home the thought that any community that has the plan habit in its building will build better, more attractively, more harmoniously and with less expense or friction than the community that has the cut and try habit and builds by the guesswork of its jack-knife carpenters. And it is the duty and to the advantage of the local lumber dealer to encourage the use of plans in every possible way.—American Lumberman.

Canadian Timber Trade in South Africa

Conditions Which Restrict Its Use—Market for Dressed Lumber, Sash and Doors, Mouldings, Handles, Etc.*

By H. R. MacMillan

The three important classes of dressed lumber imported are flooring, ceiling and shelving.

Flooring

Throughout the country in all classes of buildings Scandinavian flooring is used, about one-third from Norway and two-thirds from Sweden. It is imported ready manufactured in one grade, known as colonial firsts, which is really a mixture of first, seconds and thirds, in two important sizes, 6-inch by ⅞-inch and 6-inch by 1⅛-inch. Small quantities of 4-inch and 4½-inch widths in the above thickness are also imported. The usual lengths are 6 feet and up odd and even lengths to 24 feet. All flooring is planed, tongued and grooved; the machine work is excellent. All Scandinavian flooring is full of hard black tight knots ½-inch to 1½-inch in diameter. The flooring when laid is usually covered with linoleum or carpet.

The price of Scandinavian flooring in normal times is $32 to $34 per thousand feet board measure, when sold wholesale in large quantities at a South African port. It is imported at $29 to $31 c.i.f.

Eastern Canadian manufacturers should in normal times be able to compete with these prices, particularly as flooring is dutiable, and they have the advantage of a 3 per cent. preference. The flooring does not consist of carefully selected lumber, but is simply sound redwood (Pinus sylvestris) free from checks or loose knots, run through a flooring machine and well manufactured.

Douglas Fir for Flooring

Douglas fir flooring has been extensively used in South Africa in schools, halls, Government buildings and to a certain extent in better class residences. So far as wear is concerned edge grain flooring gave excellent satisfaction. Several serious cases of dry rot occurring in Government buildings have led to an embargo being placed against its use by certain public works engineers in important districts. This is unfortunate as the Government was by far the most important purchaser and their action will influence others. Architects now hesitate to recommend it for dwellings because of dry rot. A representative case of dry rot in Douglas fir flooring occurred in the new Government Museum, Pretoria. The flooring used was edge-grain 4½-inch by 1¼-inch Douglas fir. It was laid on a cement foundation with an air space under the floor. It cost when laid $14.40 per 100 square feet. Within one year 2,000 lineal feet had to be removed because of dry rot. The remainder was given two coats of carbolineum and after three years now appears sound.

The flooring is evidently affected by dry rot when shipped in the same cargo with wet timbers. Unless some means can be discovered of preventing dry rot the market for Douglas fir flooring is likely to be small in the future. On the other hand, the market will be excellent if it can be demonstrated that dry rot is overcome.

Attempts have been made to manufacture Douglas fir flooring in South Africa by re-sawing and machining selected merchantable deals and timbers. Flooring so manufactured has not been as well manufactured as the imported and has contained 20 per cent. or more flat-grained boards. Flooring domestically manufactured will not compete with the imported.

The Public Works Department estimates 4½-inch by 1¼-inch Douglas fir flooring to cost when laid $14.40 per 100 square feet, and 4-inch by 1⅛-inch Scandinavian flooring to cost $12 per square. The Scandinavian floor is full of knots.

Teak and other hardwood floors are used in very costly residences.

Swedish flooring is extensively used by the Railway Department in lining freight cars.

Ceilings

Nearly all ceilings in South Africa are varnished wood, even in plaster finished houses. There are very few pressed steel, plaster or other ceilings. The standard ceilings are Scandinavian colonial firsts, Baltic redwood, planed, tongued, grooved and double beaded, 6-inch by ½-inch, with a very small proportion of 4-inch by ⅝-inch. No "V" joint ceiling is imported. Scandinavian ceiling is made from the same class of timber as Scandinavian flooring and costs c.i.f. about $2 more per thousand feet board measure.

Whereas for Government buildings and better class residences there was a demand for Douglas fir flooring, there has never been a good demand for Douglas fir ceiling. It has always retailed about 2 cents per foot superficial more than Scandinavian ceiling and the price has killed it. Douglas fir ceiling shipments have also suffered severaly from dry rot.

The Public Works Department estimate that ⅝-inch by 4-inch Douglas fir ceiling costs them $9.60 per square when in place, as compared with $8.40 for Scandinavian.

Eastern Canadian manufacturers should be able to compete in South Africa with ceiling as well as with flooring.

Shelving

The shelving trade in South Africa is apart from the lumber business. Shelving is the general name given to 1-inch by 12-inch to 16-inch by 12 feet to 16 feet dressed boards, number one or two, preferably white pine, but sometimes spruce, Western balsam or larch, Russian yellow pine, or Douglas fir, carried in stock throughout the country by general merchants and hardware dealers and sold for shop fittings, household carpentry, shelving or coffins. The demand is for a wood that is free from checks or loose knots, is smooth, easy to work, will hold paint and not split easily. The shelving imported for the interior is rough to save freight charges, the remainder is dressed to ⅞-inch.

It is a curious development of the trade that lumber for carpentry work may be bought more easily in the South African town than in the Canadian town. In South Africa a small stock of shelving is carried by every hardware store, along with nails, paint and other woodworking materials. This undoubtedly leads to an increased use of this class of lumber.

Quebec pine formerly held this trade, but has in late years become too high in price. Western white pine is now the chief shelving lumber imported.

The greater part of the shelving imported is purchased by commission houses in South Africa who forward their inquiries to New York buying agents. A list of these buying agents is in the hands of the Commissioner of Commerce. Small quantities are purchased with lumber cargoes shipped from the Pacific coast. The purchases made through New York are shipped overland by rail from as far west as Idaho and British Columbia and forwarded to South Africa by liner.

Shelving an Important Trade

The trade is an important one. Several wholesale hardware firms handle 5,000 boards a month and many bulders and general merchants import in carload lots. The prices for Western white pine shelving have been $22 per thousand f.o.b. mill and $38 per thousand feet f.o.b. New York.

The bulk of the importing for this trade is now in the hands of the American commission houses mentioned. Many South African dealers would buy from Canadian shippers and benefit by the preferential duty if they could get in touch with Canadian exporters who could be relied upon to send forward a satisfactory article. There is an opportunity here for Montreal or Vancouver lumber brokers. Lists of reliable shelving importers may be secured from the Canadian Trade Commissioner at Cape Town. Western yellow pine and spruce will both be found suitable for shelving.

An energetic Canadian brokerage firm taking this business up should be able to secure a large proportion of the trade, shipping Quebec pine when cheap enough to Montreal or New York, and Western white pine, Western yellow pine or spruce by rail to Montreal, Vancouver or New York. The American commission offices handling this as a side line with other trades have branch offices in South Africa. Other American houses having no branches in South Africa send a representative out at intervals of two years or so to keep the trade alive.

With the shelving trade could be handled a trade in clears and interior finish.

Other Woods Imported

Fairly large quantities of clear white pine, sugar pine, Western larch, redwood, Siberian yellow pine are consumed in South Africa yearly. The chief uses are for pattern making, shop fittings, cabinet work and joinery. The very best qualities obtainable are desired, and the c.i.f. prices vary from $52.50 per thousand feet c.i.f. on a 60 shilling freight rate for Western larch, which is the cheapest clear lumber imported, to $110 per thousand c.i.f. for clear white and sugar pine. The sizes usually purchased are 1-inch, 1½-inch, 2-inch, 3-inch by 12-inch to 18-inch by 18 feet to 24 feet.

It has been found recently that perfectly clear white pine, resembling Quebec white pine, but a little yellower in color and shorter in grain, can be purchased in unlimited quantities in Vladivostok. A full sailer cargo recently arrived in Durban. The first, second and third grades were free from knots or any defects and would grade as firsts in Canada. The cargo was nearly all clears and consisted chiefly of 2-inch, 3-inch and 4-inch by 8-inch to 24-inch in 16 feet to

* Continued from April 1st issue.

24 feet length. This Siberian white pine appears superior in grading and working qualities to any other clear timber imported into South Africa and is believed to be cheaper in price. It is imported at a c.i.f. price in the neighborhood of $70 per thousand under war freight rates. If there are large quantities of it tributary to Siberian ports Canadian exporters of clear lumber may expect to meet some keen competition. The manufacture is excellent, equal to the best Swedish.

Interior Trim

There is a demand in South Africa for a wood for interior finish that will come between the Scandinavian woods used in cheap buildings and the teak at $2.50 a cubic foot and the mahogany at 16 to 20 cents a square foot used in the most costly business offices and dwellings. Redwood is used for this purpose now at a cost of $1.35 per cubic foot c.i.f. Those who have used Douglas fir for this purpose have found it satisfactory for interior finish, stairs, panelling and furniture manufacture. There are yet a large number of builders and architects who have not seen it used and who do not believe it satisfactory.

The greater part of the clear Douglas fir used in South Africa is re-sawn from merchantable timbers. Naturally the best quality of clears cannot be secured in this manner, and the reputation of the timber suffers accordingly. Further, if a shipper is so unfortunate as to send forward a merchantable cargo that will not produce a fair proportion of clears for the importer there is a complaint.

Advertising Necessary

Douglas fir has been found satisfactory for joinery and interior finish. The quantity used for these purposes can be greatly increased by intelligent advertising amongst architects and builders. The aim of the advertising should be to point out the proper grade to use for best results, to make known the results that may be obtained by various methods of finishing, and to show how the wood should be used to prevent splitting or checking. Such advertising should not be carried on at long range, but by a man on the ground.

The samples exhibited before architects in South Africa surprised them. They had not known the possibilities of the timber. The flashy slash grained effects are not so popular as is the close grained quiet finish. Few of the merchants importing Douglas fir know the possibilities for interior finish. The head office of one timber importer finished in pitch-pine was pointed out by the owner as something quite beyond the possibilities of Douglas fir.

An opening exists for three-ply for panelling and for manufacture in South Africa into special lines of doors. Sugar pine three-ply is now imported for that purpose.

Any company desirous of shipping clear fir or three-ply to South Africa should make arrangements through the Canadian Trade Commissioner to have reputable firms in the different cities handle their goods.

Mouldings

The mouldings used in South Africa are practically all made in the country from Scandinavian red deals. Such goods as are imported are from Sweden and Norway. Small quantities of white pine facias, balustrades and verandah brackets, blinds and finials are imported from the United States which could be supplied from Eastern Canada. These goods are imported by the leading general merchandise and lumber companies. A list of wholesale moulding prices may be obtained from the Commissioner of Commerce.

Where Douglas fir is specified for interior joinery the moulding is usually made to order to special designs. There is but little prospect for a market in Douglas fir mouldings. The leading timber dealers, especially those who import Douglas fir by cargoes, operate planing mills and discourage the importation of manufactured goods.

The quantity and origin of the box shooks imported into South Africa in 1914 is shown below:—

Country	Value of Imports, 1914
Sweden	$61,935
Norway	11,982
United Kingdom	7,922
United States	1,205
Holland	863
Germany	731
Canada	23
Total	$84,661

The importation of box shooks increased steadily from $45,892 in 1909 to $95,022 in 1913. Whereas the importation of all other wood goods showed a decrease in the first eight months of 1915, box shooks were purchased in larger quantities than ever.

The importations credited to Great Britain represent transhipped shooks. The proportion supplied by Sweden has grown in eight years from one-half to three-quarters of the total.

The shooks imported into South Africa represent about half the total used. The remainder are manufactured in the country from imported Canadian short spruce deals.

South African purchasers desire to buy Canadian shooks, on which there is a tariff preference of three per cent. The Trade Commissioner has sent forward many trade inquiries and no business has resulted. There is an opening for an excellent export trade. The market available is the $409,000 now done each year with foreign countries, and the $400,000 now done by South African manufacturers who are working under the handicap of small factories and imported timber. The fruit and manufacturing industries of South Africa are developing rapidly, especially the former, and the demand for boxes will inevitably rapidly increase. There is no prospect that local wood will be suitable for anything but low grade boxes for many years. A well-organized factory in Eastern Canada properly located with reference to raw material and shipping facilities could do a big business in South Africa.

A large proportion of the box supply for South Africa is purchased by two London companies whose names may be secured from the Commissioner of Commerce.

Any company willing to export shooks to South Africa should, when communicating with agents or importers, send sample shooks to show the character of wood used and quality of manufacture.

It is possible that arrangements could be made to ship boxes from British Columbia with lumber cargoes. If this can be done orders can readily be secured. Such methods of shipments would suit the fruit industry, for which all the boxes are desired in September to November of each year and can be taken in one shipment. A trial shipment of apple boxes has been made from the Pacific coast and found satisfactory.

Inquiries and specifications for fruit boxes have been sent forward at different times (refer Trade Inquiry No. 65). Western manufacturers desirous of quoting on these for delivery fall of 1916 should secure them, together with a list of importers, from the Commissioner of Commerce.

Sashes and Doors

The imports given under houses and frames refer almost exclusively to sash and doors. The imports during 1914 and the countries of origin are given below:—

Country.	Value of Imports, 1914
United States	$20,677
United Kingdom	15,854
Sweden	12,942
Norway	1,612
Germany	640
Australia	84
Canada	35
Total	$51,844

The importations under this head have grown greatly from $29,095 in 1909, but have remained fairly constant in the past three years. The United States has held the lead for several years. The shipments credited to Great Britain represent re-exports.

The major part of the imports consists of doors. The sash, which were formerly imported, are now manufactured in the country, mostly from fourth grade Scandinavian deals, though small quantities for better houses are made from Siberian white pine or teak. Nearly all the doors used are imported. The only exceptions are the doors for costly private residences and public buildings, nearly all of which are manufactured in South Africa from teak and cost $1.75 to $2.50 per superficial square foot. The manufacture of Siberian pine doors in South Africa may be expected.

The Swedish doors are all manufactured with glued two-piece panels, which split. A one-piece panel is necessary to meet the requirements of the South African trade.

Sizes and Prices

The doors imported from the United States are white pine. The greater proportion of the doors imported are four-panel DM third grade. The chief sizes and prices are:—

Size.	Price each, f.o.b. Steamer, New York.
2 ft. 6 in. by 6 ft. 6 in. by 1¼ in.	$1.54
2 ft. 6 in. by 6 ft. 6 in. by 1½ in.	1.73
2 ft. 6 in. by 6 ft. 6 in. by 1¾ in.	2.25
2 ft. 8 in. by 6 ft. 8 in. by 1½ in.	2.85

These prices ruled in September, 1915, and are subject to a discount of 15 per cent. with a further discount of 2½ per cent. for cash. The door business is important in South Africa and will continue to be so. The doors imported from the United States come from New York and Michigan and are probably made from Canadian pine. It should be possible to make them in Canada.

Douglas fir doors have not been tried in South Africa excepting

a few made by local joiners, which have given good satisfaction. Those shown to the architects attracted faborable attention. The three-ply door is best adapted to the climate and is better manufactured than any door in use in the country. There is a market for a better looking door than Swedish that will sell for less than teak or mahogany. The three-ply Douglas fir doors fill those requirements. If arrangements were made with lumber dealers to carry small stocks in each city business would result. It is quite likely that the purchasers would paint Douglas fir doors, as except on teak and mahogany no natural finish is used. For this reason a cheap door might succeed better in the South African market than the clear door. Both should be tried.

Handles

The importations of handles into South Africa for 1914, and the countries supplying them are shown below:—

Country	Value of Imports, 1914
United States	$ 8,693
United Kingdom	5,066
Canada	782
Norway	296
Total	$14,837

The great mining industry of South Africa, the use of the hoe as the universal agricultural implement by the natives and the extensive public works have resulted in a large import trade in handles.

The demand has been for hickory, but as hickory is becoming increasingly difficult to get, maple is being accepted in small but increasing quantities for pick and hoe handles, the two most important lines.

Handles are imported in crated cases of 10 dozen. Many sizes are used, which may be obtained with wholesale prices from the Commissioner of Commerce.

Prices of Handles

The ruling price for hoe handles 54-inch by 2-inch is 85 cents per dozen f.o.b. steamer New York, less 2 per cent. Pick handles, "A" quality hickory, are purchased at $2.05 per dozen f.o.b. New York, less 50 per cent. discount. Drill hammer handles, hickory, cost f.o.b. New York, for 1¼-inch by 1-inch, 24-inch long, $1.60 per dozen, 1½-inch by 1-inch, 36-inch long, $3.53 per dozen, less 75 per cent. and 5 per cent. discount.

Handles are now being made in South Africa from native woods. The further use of native and planted woods may be expected to cause a decrease in importations.

Handles for this market must be well manufactured.

Staves

The staves used in South Africa are chiefly oak, imported from the United States for the liquor trade and do not offer a hopeful prospect for Canadian manufacturers. Staves and empty casks are imported to the value of about $18,120 yearly.

Shingles

Shingle roofs are very uncommon in South Africa. The only shingles used have been a few mine buildings, explosive works, a few of the better class houses and bungalows and a few seaside bungalows.

Galvanized iron is used for the reason that it can be laid quickly with the labor available, and is cheaper. On the Rand, the most populous centre in the Union, in normal times American cedar shingles 6 to 2, 18-inch, sell at 12s. 6d. ($3) per bundle. Galvanized iron sells at $67.20 per ton. The cost of a galvanized iron roof laid is $18 per square, including the rafters and plates. The cost of laying galvanized iron is $2.40 per square. The cost of a shingle roof, partly owing to the more expensive roof framing required, is $24 per square. The galvanized roof, if painted every two or three years with cheap red oxide, will last twenty years. The shingle roof to last twenty years must be painted regularly; the cost of painting shingles is greater than is the case with iron.

Tenders were called in Johannesburg recently for the construction of ten cottages each with sixteen squares of roof. The prices submitted for shingle roofs were $250 per cottage higher than for galvanized iron roof.

Shingle roofs were seen in Johnnesburg that were in excellent condition after eighteen years' service.

Because of the price, shingles have been used only for the best private residences. Tiles are now competing with shingles on this class of building. Excellent tiles are now made in South Africa, and a tile roof finished in Johannesburg costs $21 per square, as compared with shingles at $24. The tiles themselves cost $8.40 per square delivered on the job.

That shingles have given eighteen years' satisfactory service in the South African climate is a proof that they will stand any climate. This indication of durability is the only valuable feature of the shingle business in South Africa.

The match industry in South Africa has been dependent on supplies of Baltic alder. The possibility of a supply of timber from Canada has been taken up thoroughly by the Trade Commissioner at Cape Town, and both white birch from Quebec and alder from British Columbia have been tried. Both have been found satisfactory. The problem to be solved is the regular delivery of these timbers in a moist condition to factories at Durban and Cape Town. 400,000 cubic feet yearly are required of blocks 9-inch to 20-inch in diameter. The c.i.f. price should be, in normal times, about 35 cents per cubic foot.

Wood Paving

The mileage of paved streets in South Africa is very small (less than one mile). No increases are likely for some time. Labor is cheap and the tendency is to use macadam and rock base asphalt paving. The only wood block paving is in Cape Town, where a small quantity of creosoted Baltic pine has been used.

General Summary

There is a constant market in South Africa for three of the important forest products of Eastern Canada, red deals, box shooks and doors. The raw material for these manufactures is cheaper in Canada than in either the United States or Sweden, the two countries at present doing the bulk of the trade. It is only a question of organizing the manufacture on a competitive basis and seeking the business.

That there is any Douglas fir sold in South Africa is due entirely to the initiative of the South African merchants in seeking it, not to any selling efforts on the part of the producers of Douglas fir, who have committed here, as elsewhere, the fatal error of considering that their selling responsibilities have ended when they have finished competing with one another for the privilege of supplying lumber to a commission house. South Africa is a country importing $6,000,000 worth of timber a year. Douglas fir came into this market a new commodity a quarter of a century ago, unknown to purchasers, builders, architects, engineers or merchants. As with all new commodities there were prejudices against it. No one, not even the dealers, were interested in it. Douglas fir manufacturers, the only persons interested, were 13,000 miles away and had no direct representatives.

The result was just as might be expected. Instances have been quoted showing the unreasonable, almost incredible prejudices existing against the timber. These prejudices, which differ in every part of the country, have risen through ignorance of the timber. A cargo of flooring is affected by dry rot. No one is in the country to take the question up at once, and Douglas fir flooring is tabooed. Merchantable is used for car sills where select should be used; it is not satisfactory and the railroad goes back to pitch-pine or teak at twice the price. On the other hand, one mine, of one hundred on the Rand, uses Douglas fir and finds it satisfactory; no one finds it out and conducts a systematic campaign to educate the other mine managers. No one does these things because there is no one in South Africa whose business it is to do so. So long as timber is used the timber merchants are secure. The money which might have gone to removing these prejudices and developing the market has gone to the merchants, who charge four times as much profit on Douglas fir in South Africa as on Swedish timber. The profit on wholesaling Douglas fir in South Africa is greater than the total f.o.b. price in British Columbia.

Establishing of Sailings

The establishing of regular sailings even of small vessels once in two months, between British Columbia and South African ports would greatly increase the exports of Douglas fir. The purchase of cargoes, with accompanying heavy investment, the holding of cargoes in stock with interest charges accumulating and stock deteriorating one year or more would no longer be necessary. The importations would no longer be restricted to five or six merchants for the whole of South Africa. All persons engaged in the trade would import, and more energy would be shown in pushing the sale of the timber.

The elements of a great and successful market campaign exist in South Africa. Douglas fir is delivered to South Africa cheaper than any other timber.

About $5,000,000 worth of timber is now imported yearly for general building and construction purposes alone. The country is yet undeveloped. Even greater quantities of building and construction timber will be required in the future. Every producer of Douglas fir knows it is a construction timber, then why does Douglas fir represent only seven per cent. of the imports of building timber to South Africa? Because no one in South Africa is selling Douglas fir, and the moment it arrives in the country it is robbed of its one great advantage, its cheapness.

It is only necessary that the problem be treated on broad lines. The timber industry, if organized, is wealthy enough and strong enough to market lumber in the same manner as gasoline, tobacco or steel products are marketed. The cost of doing this in South Africa will be very small, and when it is done the exports will leap from insignificance to importance.

Relation of Retailer and Salesman

Mutual Interests Can Be Developed By Friendly Co-operation—How It Works Out

By J. C. Proctor

The relation of the retail lumberman to the wholesale lumber traveling man is a broad or narrow subject, as the one trying to discuss it may make it.

The retail lumberman, it would seem, is in a position to become, and should become, better acquainted with the salesmen in his line of business than the retail dealers in other lines do with the salesmen in those lines. The nature of the lumber business throughout makes it more or less active throughout the year. This causes buying at all times of the year, bringing buyer and seller together often. With the limited number of yards in a town the salesman has, as a usual thing, plenty of time at each yard. And if the dealer is not pressed for time, a few minutes talking results in good for both. In that way a more friendly feeling and a closer relationship should result. Both have what the other should want. Not only in actual merchandise, bought or sold, but in being of mutual help to each other. The dealer learns of conditions in other localities that may effect prices or prompt delivery. The salesman gets to know the grades and sizes of stock peculiar to each town and soon knows where any specials his firm may have can be disposed of to the best advantage. Such knowledge profits both.

There is a limit on both sides of doing favors and being kind and courteous to each other. It is with granting this limit that it would seem that a retailer would be short-sighted not to see that it is greatly to his advantage to stand well in the salesman's opinion. And the salesman must nowadays stand well in the retailer's, for the help that it is possible for either to give is not always given promiscuously.

Those Who Stand the Best Chance

The ones who have been proven to be thoughtful and square and have appealed to the respect and liking of either must stand a better chance of receiving whatever advantage or help the other has to offer. Very often time is a matter of much concern to both. More often, possibly, to the retailer; and consideration of this point by both means not unfrequently a touch of tact and friendliness that is often overlooked. The retailer who is well thought of is much more apt to have his needs in the particular kinds of material used in his locality looked after by the salesman than the one who has not always had this relationship in mind. A slip in courtesy or tact may lose a valuable help in times of rapidly rising prices; valuable suggestions in the way of a low price of short lengths. Number 3 boards, shiplap or center-matched may also assume unrealized points of quality and usefulness and entice him into a venture of purchasing articles that may answer where a better grade has been used before. This lower grade material, one might believe from all one hears, would almost cause a dealer to wonder why he never bought a better until he gets it—and then he knows why.

Substitute lines of lumber also have a way of creeping in to many yards for a few months on a rising market, until they have caught up and passed the regular lines. Would these changes in stock, with their accompanying saving in cost, occur as often if the relationship of the salesman and retailer were strictly on a business basis only? A salesman is going to sell all that he can to anyone that it is his business to sell, but if only a limited amount of material can be sold, he will naturally give the opportunity to the retailers that stand well with him and his house.

The Omnipotence of Price is Passing

The times have not passed, but it would seem that they were passing, when price is the only point that sells lumber. Price will always be the main point of a lumber "buy," but more and more it would seem that price alone will not make the sale. The difference in timber, grading, millwork and drying at the different mills are all being taken more and more into consideration. The dealer no longer wants anyone's No. 1, No. 2 or clear, but keeps tab on the mills that have shipped him the most satisfactory article in the grade he wants. Naturally all buyers want to do the best they can in price, granting they have found what they want in material and service. But isn't the price question between dealer and salesman just what each salesman makes it? A dealer will soon learn whether a salesman will cut his price or not, and the one that will cut his price will be expected to cut again, and maybe will soon learn to have his price so that he can afford to shade it by an advance to take care of a cut. The man that makes a price and knows no other, may lose some business now and then, but isn't he more apt to come out ahead in the end? His first price is very likely to be always the best he can do, and it would seem that this would soon count both in business secured and in the respect of the dealer. Prices may differ to the various dealers in the same territory on the same material, and there are plenty of arguments about this. To be or not to be is the question. The salesman who makes two prices will likely in time have the chance to quote only to the ones where he uses his best price. Possibly to those he quotes the higher prices he does not care very much to sell. Whether or not this may be so, the right relationship can hardly mean anything but his best price to all, other considerations being equal. This different price to different people on the same article probably exists in all kinds of business. It suits the one getting the low price, and cannot suit the one getting the other end of it.

The salesman may not be at fault on these differences in price; possibly his firm has had trouble in settlements, disputes over shortage or undergrade that may justify them in wishing to fight shy of the buisness or to take it only at a large profit. Trade-marking of lumber that has taken a start should be a matter of a great deal of interest to both retailer and salesman. It looks as if it would soon come into very general use. The mills that will go into it are the ones that must be taking particular pride in their timber, millwork, or methods of drying. Maybe in all of these points or in some of them at least, the trade-marked lumber should be an article that can be depended upon to run uniform all the time and something that repeat orders will bring dependable grade on always. Once started in handling and pushing a trade-marked article, the retailers would know better than they now do, the different grades in their yards. As it has been the retailer has been trying to get the best in the grade he wanted, but a No. 1 piece of dimension or a No. 2 board covers a multitude of sins often, and sometimes many points of quality.

He Doesn't Remember When He Should

On a rising market, or in a hurry at times to replace suddenly depleted piles, does the retailer always remember where he received the best grade, and does he not often still think that a No. 1 is a No. 1 no matter where it comes from, until the car gets in, and then he remembers too late? What he gets may be a grading-book No. 1, but far short of what he could have received if more care had been used in buying. With the quality part fixed in his mind, by the hammering of trade-marked lumber by the salesman and getting to know that it means something, the old grading rules will not bother him so much. He will, if he keeps it up soon, have a stock that he will be proud of, and the salesman will feel that he is selling something else than just lumber.

The red cedar shingle people, oak and maple flooring firms have been doing it for a long time. The yellow pine people—Cady, Kirby, Bogalusa, the Arkansas Soft Pine bunch and others—are already at it, as well as the cypress people. Doesn't this look as if it were going the old grades several better and would give both retailer and salesman something much more satisfactory to buy and to sell than the old way?

The retailer buys primarily from the salesman or firm that has shown him that he can rely on getting the grade and service he wants, but isn't it true that there are many firms that differ but little in these points? The one that gets the most business from a certain territory is the one that has been either wise or fortunate enough to have the right sort of representative there—a man who is certain of all facts that will lead to prompt shipment and proper care of all orders; one who knows from personal experience gained through either working at the mills or from frequent visits there, all of the grades his mill gets out; how one grade may be exceptionally good and others not so bad; how the lumber is milled, and how it is dried—in fact everything that should be known by both salesman and retailer.

Shouldn't Abandon the Order to the Office

Salesmen should not let the office tend to the order entirely after it is once written up; but the interest shown in keeping after the orders until they are shipped, and in wanting to see the material after it is in the yard, and taking pride in a good lot or admitting a fault when one exists—it would seem should help in gaining confidence in the salesman and his house. A salesman who takes interest in stock other than his own, praising a good grade another firm has shipped or showing a fault in another lot, surely cannot hurt his house or himself. Doesn't he leave the feeling that he is on to his work all the time and does not lose interest in the retailer and his order as soon as the order-book is closed, and that he is interested in the order from the time it is written until it is delivered, and in knowing that his mill has shipped what is right? Undoubtedly practically all of the salesmen know about the products of their mills and how the business is handled, but too few speak out about it.

Prior sales are often a cause of misunderstandings. It looks as if they should be regarded simply as a bet between dealers, as to whose order will reach the office first. But does the dealer always look at them in this light. The day or two that goes by before he learns whether his order has been accepted may have afforded him a chance to have made a like purchase without the string of a prior sale attached. It is not the fault of the house or the salesman that has made the sale that he has lost his bet, and he should accept the result with good grace.

Complaint as to undergrade stock is also a stumbling block on the road along which pleasant relationship travels. Undergrade in some

items often gives the dealer something his market does not use. To move it, a much lower price than the sales-office can understand is justifiably made. With extra work in sorting amounts up, as well as counting all fair costs and the necessary cut in price to move the material, doesn't it look as if this were the fair basis for all settlements? These things could be fixed up every time so that no ill-feeling could result to either side if reasonablesness is used by both. And this ill-feeling profits neither at almost any financial gain. There are many ways and many instances in which the salesman can make money for the retailer, and courtesy and fair treatment on the part of one will not only be returned in like measure but will often result in good to both parties. All personalities are not made to work together and misunderstandings will result at times. All salesmen do not appeal equally to all of the retailers nor do all retailers appeal alike to all of the salesmen. A fair average is all any one may expect, and the higher the average of all concerned the more pleasant will this relationship be.

Assets of a Successful Retailer

By J. C. Dionne

The old time dealer had only two assets—a stock of building material, and a knowledge regarding that stock. To the successful retail lumberman of the future, those two assets will be considered of nothing more than secondary importance—rather than all important.

First—your yard. Is it a good advertisement for a professional builder? Is it well painted, in good order, and does it reflect well upon the material from which it is built? If it isn't, make it so.

You wouldn't buy hair restorer from a bald headed barber, would you? Then why should a prospective builder accept advice from a building material man who doesn't use it himself?

How about your office? Is it a place in which you are proud to bring a lady who wants a home, and wants to look over your plans, pictures, and suggestions for home building? Then make it so.

Is there anything in your office to catch the eye of the building prospect when he or she enters, and to create an idea at once of an attractive home? Does your office bring the thought of a home, like the interior of an automobile store brings the idea of an auto? Then make it so.

How about the house you live in? Is it an inspiration to your fellow townsmen to have better looking homes? Then make it so. This does not mean that every retail lumberman should live in a mansion. Far from it. But see that your house is well and tastily painted, that there is a look of neatness and freshness about your place—even thought it is a $1,500 bungalow. That speaks well for your taste as a building expert.

Have you in your equipment a hundred or more pictures, plans, etc., of attractive homes, so that you can furnish the incentive to the eye of the man or woman who is considering home building? Then equip yourself.

How about your advertising? Do you run a card in your local paper now and then calling attention to the fact that you are headquarters for building material, and "When in the market let us figure with you?" If so—change your system quick. You must advertise, but what you are doing is not advertising. Or do you run a picture of your yard and declare it has splendid facilities? If you do, cancel the contract and save your money. You are throwing it away. You must advertise—but that means use brains, energy, and money. Advertise something specific. A bungalow—showing the price you will sell the material including the plans for; a barn, showing the same thing; or a garage, or a shed, or a sleeping porch, or any one of a score of things that your trade may be interested in. Advertise something specific and put a price on it, and keep on advertising, and don't be surprised if the local newspaper man has nerve enough to charge you for the space. Pay the bill and keep on advertising, and you will find in the end that you have made a good investment, and that the returns are manifold and real.

Do you keep closely in touch with your trade? Do you force them to know what you have to sell, and what you have to offer them specially? Have you the good will of your townspeople? Have you their respect as a building specialist? Are you working for the development of your community? Are you working to improve your salesmanship? Do they look on you as a live merchant?

Then get busy and achieve all these things and you will find enjoyment and profit both in watching your returns come in.

Are you a dreamer? Then be one. Use your imagination. Let it work full time. Don't try to put brakes on it. Don't be ashamed to dream. There never was a big man in this or any other country who was not a dreamer.

Dream that your town and community is the most beautiful in this broad land—then work to make it so. Imagine how it ought to look; how each building might be, study how that result could be brought about; get busy and make your dream come true.

Take the houses in your town, the stores, the barns, the fences that you see every day; take the vacant lots; take all of these things and consider their building possibilities.

Take Smith's house, for instance. What could—what should—Smith do to make that house more attractive, more comfortable, more enjoyable to his family? Does it need paint? a new roof? a new fence? sleeping porch; screens or anything?

Decide what, and talk to Smith about it. Have your figures ready. Tell him what it will cost. Show him plans of other houses like his, and what their improvements are. Sell these things to Smith first in your own mind, and then go sell them to Smith himself.

Don't wait for the people of your town and district to decide that they want to build. Shoot the idea into their minds. Cultivate it. Mature it. Sell them the material. Furnish them the plans.

It doesn't take even a full witted man to be able to sell lumber that the other fellow knows he needs. Make him see that he needs something, and then you will be creating something. Use your advertising, your imagination, your plans and helps, and create these needs of your customers. When you do that you'll never need to bother about competition. There will be none.

List every man in your community. Look over his property, his house, his barn, or his lack of these things. Have a reference at your office to show what you consider the possibilities of every man in your district to be in a building line. Then keep in behind them all. That's the big story.

When you do these things and do them right, no mail order man will ever bother you; the bank won't ask you for an indorsement when you want a loan to care for your increased business; you will have become a real retail lumber merchant.

I have had men say to me, "Your advice is all right in a city or where conditions are flourishing, but in my section right now there is very little money and few possibilities to work on." To the man who takes that attitude, all things are difficult. To the man who starts in by saying, "I can't," I have no hope to offer. He says "I can't" because it is something new that he has never tried, and he immediately pleads guilty in his own mind to business incompetency, and sentences himself to the jail of business depression.

Dream, plan, advertise, and act, and you will make two houses stand where one stood before—and both of them will be freshly painted and in good repair.

There is no town so dead that live men can't awaken it. Remember that it isn't the houses, stores, and other buildings that make a town. It is the men who live there. If you say "My town is dead," you are saying "I'm a dead one," for you and your town.

Railways Building Many Cars in U. S.

The shortage of freight cars, due partially to the freight embargo in the eastern states, has caused a rush of carbuilding, with the purchase of enormous quantities of lumber for use in the new rolling stock. The American Car and Foundry company, for instance, has closed contracts for 2,500,000 feet of Douglas fir for 500 automobile cars for the Burlington road. This is only one of several big contracts, closed or prospective.

Orders for material for the construction of 500 freight cars have been placed with a Portland company by the Great Northern railroad. The order calls for approximately 3,000,000 feet of fir. The business will be distributed among mills in the west coast district.

Inquiries have been issued by the Pittsburgh, Shawmut and Northern Railroad for 250 gondola cars, which will require the consumption of approximately 750,000 feet of lumber, either yellow pine or Douglas fir. Calls for fifty freight cars have been issued by the Cumberland and Pennsylvania Railroad, while the Warner Sugar Refining Company of New York is in the market for 50 to 125 freight cars. An inquiry has been issued by the Carnegie Steel Company for sixty gondola and eighteen flat cars.

Expansion of a Progressive Lumber Firm

Robert Bury and Company, lumber merchants and selling agents for The Dominion Mahogany and Veneer Co., Limited, have recently moved from 79 Spadina Avenue, Toronto, to larger and more commodious premises at 455 King St. W., occupying the entire ground floor of this building. The offices are located at the front and the rest of the ground floor is devoted to warehouse space. This has been especially fitted up for the carrying in stock full lines of veneers, kiln dried mahogany and walnut lumber. Over half a million feet of mahogany is at present in stock besides full lines of all kinds of piano and furniture veneers. So that the company are in a position to fill all orders from stock at the shortest possible notice. In addition to this warehouse, large yards are maintained at the foot of Spadina Avenue, with direct railway connection on all lines. The company report business as splendid and are contemplating a big season's turn over.

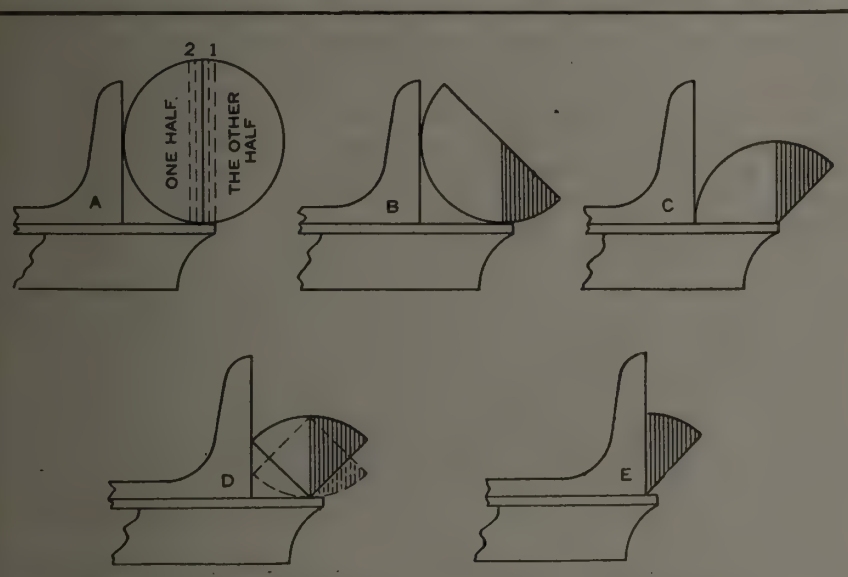
Quarter Sawing in a Nutshell

In a recent issue some one asked regarding the special difference between red and white quarter-cut oak, also red and white plain oak. There should be no difference in the method of cutting quarter-sawed lumber if the object is to display figure, as in sawing the oaks, sycamore, beech, etc., or any wood having the hard or horny medullary "rays"—which is the "figure." To display this figure the lines must necessarily be more or less parallel with these rays; the nearer this parallel, the larger the figure shows. Red gum is quarter-sawed primarily to prevent warping in seasoning, also to show the mottled or color figure. Yellow or hard pine is "rift" or edge-grain sawed, to make it more durable, as in flooring, and to prevent splintering or "scaling;" and it also places the structure of the wood in the strongest or stiffer position.

Methods of plain sawing are about the same for oak and all other hardwoods—that is, sawing the log with the growth rings. Special methods for producing lumber for special purposes vary according to the object sought to be attained.

The sketch herewith shows what I think is the best method of quarter-sawing oak. First split the log as at A, cut one-eighth into boards as at B, then one-eighth into boards as at C, and one-eighth into boards as at D. At E is shown one-half of the log finished; cut the other half the same way.

Some sawyers split the log at line 1, sketch A, and cut lines through the log to 2, but there is no advantage whatever in making these lines, either in width, quality or time; in fact, it wastes time, as these lines must necessarily be cut slowly, and with a chance of an untrue line occasionally. It is obvious that the widest quarter-sawed piece



This method of quarter-sawing will produce eight pieces full width from heart to bark.

can only be one-half the diameter of the log in width, and the unsound heart must come off in either case.

This method of quarter-sawing will produce eight pieces full width from heart to bark. No other method will do more and show good figure.—The Wood-Worker, Indianapolis.

The Commercial Uses of Willow

Willow ordinarily is not classed among the important commercial woods and it can hardly be said to take that rank. It is about the only wood whose marketable sizes range from the full grown tree down to the long, slender twigs or sprouts less than one-fourth inch in diameter.

Until about eight or ten years ago willow had not won a separate identity in the lumber markets, being sold almost entirely as cottonwood, coming as it does in the form of lumber chiefly from the cottonwood producing districts. Its first introduction in the North, was an experiment and these first shipments brought only $10 to $12. At the present time the price is about $16 a thousand, mill run, and clear lumber for furniture purposes brings $24 to $25.

While select logs of cottonwood will run 40 per cent. firsts and seconds, the average for that wood is about 18 per cent. The black willow of the southern Mississippi Valley runs more evenly, as its average in this grade is 20 per cent. and select logs produce 30 per cent.

The chief production of lumber is from the black willow of the district indicated. There are, however, several other varieties of willow native to the U. S. and one or two have been introduced from abroad.

High grade willow lumber is used mostly in the North for furniture drawers and backing, while the poorer grades of willow are used close to the place of manufacture in the South for box material. It is interesting to note that willow was once used for many purposes from which it was crowded out by the greater supply and the then relatively low cost of basswood, poplar and cottonwood. At the present time willow is back on the market at a lower price than these woods and bids fair again to gain favor.

Willow is a wood which may be dented and bruised without splintering and, as is well known, has been used to some extent along with ash in the manufacture of baseball bats. It is also suitable for boat building, for oars and paddles, the wooden parts of water wheels, etc., as well as for barrel bottoms. It is especially desirable for cutting boards and tables on account of its spongy softness. The wood is not warped or split by intense heat and is therefore suitable for ironing boards and for wheelbarrow bodies, for handling hot material such as ashes or for work around hot furnaces. With other softwoods it is a favorite for the manufacture of wooden toys and novelties, especially those which are not to be finished in white. It is also used to some extent for select cooperage, chiefly in the vicinity of North New Orleans, the No. 1 cooperage being used for sugar rice and asphalt and No. 2 for oysters, garden truck and vegetables. It is also used to considerable extent for the manufacture of excelsior at southern points, being confined, however, to the medium and coarse grades, the wood not being suitable for the finest comb, or wood wool. Willow excelsior is very largely used in mixture, of course, must be peeled and the trees are therefore largely cut in the growing season when the bark may be easily stripped.

The charcoal used for manufacturing certain kinds of gunpowder is willow charcoal, which produces a very pure carbon. The native willow has been largely cut out near such powder mills and they are going farther for the product and also inducing nearby farmers to set out willow plantations.

For paper making willow produces a rather short fibered pulp but this booklet states that it would be very useful for mixing with the longer pulp of longleaf pine.

One of the most important uses for willow is in the manufacture of artificial limbs, a large number of orders for export have been secured by American manufacturers as a result of the European war. The modern artificial limb as distinguished from the ordinary wooden peg is said to have been first made in London in the early part of the nineteenth century by a man named Cork, and derived the popular nickname of cork leg from this fact, although some people believe that cork is often used for this purpose. Willow, however, combines something of the lightness of cork with a superior strength.

Willow for this purpose, however, must meet certain rather rigid requirements. It will not do to manufacture an artificial limb block from a small tree containing the heart in the center of the piece, because of the greater liability to checking. A tree of twelve inches diameter or over is therefore required, although occasionally smaller trees are utilized. Only the straight clear portion of the trunk is usable, which often means less than ten feet of merchantable material from the ordinary tree. The logs are usually split into quarters as soon as cut in order to avoid possibility of checks in drying. Sometimes the ends of the sticks are painted to prevent too rapid seasoning or a hole is bored in the end of the piece, which tends to prevent end checking by distributing the seasoning process farther back into the piece from the end. Most manufacturers of artificial limbs believe that wood should be cut in the winter. Most of them consider it necessary to season the wood two or three years. One manufacturer, however, claims that willow blocks cut in July and properly handled were found as good as any which he had used.

Willow has been used to a considerable extent for fence posts; although not a particularly durable wood in untreated condition, in dry soil a well seasoned willow post will often last five to seven years, but in locations which are alternately dry and wet or where much freezing and thawing occurs their life is of course shorter. Willow is, however, a desirable wood for treatment and treated willow posts can well replace red cedar posts. Where the latter cost 40 cents or more, first class willow posts can be grown at a cost of 12 cents and second class posts for 8 cents. At a cost for treatment of 10 cents a post and a cost of 3 cents each for peeling (this author's figure, which appears to be somewhat high) the ultimate cost is 21 to 25 cents for a post that will last twelve to twenty years. Willow should be seasoned eight or ten weeks before being creosoted. Thorough seasoning greatly adds to the durability of untreated willow posts.

Willow is used abroad for the manufacture of tannin, the bark containing 12 to 14 percent of that substance. It has never been used for that purpose in this country, but the peelings from excelsior bolts and basket willows could well be utilized at a low cost. Willow tannin combined with birch tar or oil gives to Russia leather its well known scent, being used in Russia for the tanning of the finest product.

Bee keepers often plant out willows for the sake of the honey secured from the flowers, although the female or staminate tree should be used for this purpose. Willow is one of the few woods in which the staminate and pistillate varieties are represented by separate individuals.

Query and Comment

What Are Canadian "Good Sides"

Will you kindly send us a carefully worded description of the grade of white pine known as Canadian "good sides"? We wish to know particularly the following points:—

1. Will "Good Sides" allow No. 1 Dressing boards. If so, what percentage?
2. Will this grade allow No. 1 Cuts, if so what percentage?
3. Will this grade allow No. 2 Cuts, if so what percentage?
4. Will this grade allow Shaky Clear, if so what percentage?
5. What is the narrowest width that 4/4 "Good Sides" will allow?
6. What is the narrowest width that 5/4, 6/4 and 8/4 will allow?
7. In a representative grade of "Good Sides" what percentage of the stock would consist of Fine common, Selects and Uppers?—U. S. Reader.

Enquiry made by the Canada Lumberman from several well posted lumbermen in Toronto shows that the general conception of the term "Good Sides" in connection with Canadian white pine is that this grade is usually put up for export in thicknesses of 1¼in. and wider, and 8 in. and wider, usually 8 in. and wider. This grade is the cream of the log according to our information, and includes usually what are known as "selects", "picks", and "uppers" and some times "fine dressing." "Good Sides" will not include No. 1 dressing boards. As to whether No. 1 cuts may be included, this will depend upon the arrangement made at the time of the sale, frequently the No. 1 cuts are put in. No. 2 cuts are not allowed. "Shaky clear" is not allowed. As to the percentage of fine common, selects and uppers in "Good Sides,", this will depend upon the arrangement made at the time of the sale. If the arrangement is to include No. 1 cuts and better the further question will arise as to how much of the No. 1 cuts may be put in.

Logging Railroads in Eastern Operations

Editor Canada Lumberman:— Badger Brook, Nfld.

As the question of logging railroads has come up for discussion here I am writing you hoping that you may be able to give me some information as to the cost of equipment, conditions under which they will work, cost of operating, etc. Also I would be glad to know whether gasoline or kerosene can be used in place of wood or coal. In addition I would appreciate the names and addresses of some companies who manufactue the necessary equipment.

Enquiry which we have made of several users of logging railroads in eastern Canada has brought out information which is of a rather variable nature. Some firms are meeting with decided success in this method of logging, while others find various difficulties of a more or less serious nature. The situation is summed up in information sent us by a prominent operator in Quebec province, who says:—"Generally speaking our conclusion is that where there are drivable streams railroad operating should not be considered. In railroad operating, cars have to be loaded either by team or steam. To keep a mill of 75,000 feet per ten hour day capacity in operation will require two locomotives, depending on the distance of haul. This will hold good up to about 25 miles. Also one steam log loader will be required. In regard to the use of fuel oil, etc., the chief point to consider is the condition of the right of way in regard to fire possibilities. A 'safety first' policy would make the fuel oil the best to use, then coal and then wood, but when considering cost alone, the order would be exactly the reverse.

"Locomotive drivers, firemen and brakemen are a very important factor in logging by railroad. Incompetent men neglect the boilers and under their management the tubes and the fire box are short-lived. The same thing applies to a smaller extent in regard to the machinery of the locomotive. This all furnishes a source of inestimable expense.

"The type of locomotive is very important, as well as the type of logging cars. These matters will depend to a very great extent upon the locality. In regard to track construction there is only one thing necessary and that is to make the track as nearly standard as possible. The cheaply laid track is a source of heavy and continual expense for up-keep, and it causes great wear and tear to machinery. Moreover, it is a dangerous source of accidents. Roughly speaking, $5,000 per mile should be the cost for clearing, grading, ties, and tie and rail laying. To this must be added the current cost of rails.

"In districts where there is a considerable snowfall, a wind plough and flanger are necessary, and even with the best possible equipment it is a very difficult undertaking to keep things going.

"The writer has logged with almost every kind of equipment, both in the east and on the Pacific Coast, and has good reason for asserting that logging by rail is the court of last resort, in the east."

Navigation Opens on the Great Lakes

On May 1 navigation on the Great Lakes comes into full swing and it is now stated that the congestion of freight waiting to be moved at the opening of lake navigation has brought about a situation unparalleled in inland water history. According to a statement issued by the Lake Carriers' Association the volume of grain and iron ore freight under contract has now reached 100,000,000 tons. Ships that have been idle for years are being hurriedly made ready to enter trade again, giving employment to additional thousands of seamen. The lumber shipping interests on the Great Lakes are greatly agitated over present difficulties in chartering lumber cargoes. The sale of several boats recently has taken them out of the lumber-carrying trade and charter prices have increased considerably over a year ago. A freight rate increase from the head of Lake Superior to Lake Michigan and Lake Erie ports applies in both soft woods and hardwoods from 50 to 75 cents a thousand feet.

What per Cent. Are You Efficient?

By R. J. Tolson

In these days of efficiency the values of men, measures and materials are all determined by superlative tests of merit, from which the world adopts its standards.

With materials the standard represents the best, strongest or purest elements which can be combined into a finished article.

With measures, the standard is that principle which produces the greatest universal good.

With man, the standard is the climax of efficiency reached by him who has mastered and put into execution the component essentials of his chosen vocation; therefore, the rule to determine the value of man is nothing more than a simple analysis of the attributes of his character and mental efficiency; but, here we have a stumbling block, because none of us can analyze a man's brain until after he is dead, and we can only judge him by what we see and by the results he obtains; just as we cannot determine the character of work that a machine, which is new to us, will turn out until we have watched or seen it in operation.

But there is one thing we can do, and that is, we can, to some extent, analyze ourselves. We can by self analysis take an inventory of ourselves, so to speak, and determine to a reasonable degree of accuracy, provided we are honest in our values, our true measure of efficiency in the vocation which we follow.

The ideal man, in any line of business, is one hundred per cent. efficient. The hundred per cent. efficient man possesses every element which produces success, therefore every man's success or failure, in his chosen vocation, may be traced directly, or indirectly, to the degree or percentage of efficiency which he has acquired and put into execution.

To be "efficient" does not mean that a man must have the wisdom of Solomon, the genius of Edison, the poetic inspiration of Shakespeare, the financial insight and ability of Rockefeller, or the learning of Jefferson, but each of these were, perhaps, near one hundred per cent efficient in their respective vocations. A bootblack can be, as a bootblack, one hundred per cent. efficient in his particular trade, without being able to read or write. A peanut vender can be one hundred per cent. efficient in his line of business, and the chances are, if he is one hundred per cent. efficient, he will, in time, be the largest wholesale peanut merchant in the world. A mechanic may be one hundred per cent. efficient in the operation, construction or repair of certain kinds of machinery, but if he is, it will not be long before he either owns the business or has been delegated to the management of same. Likewise a retail yard man may be one hundred per cent. efficient in the capacity of assistant at a lumber yard, and if he is, somebody will be sure to know that fact, and he will not have to work in that capacity very long. On the other hand, if he is only fifty per cent. efficient he may work in his same old job until he is as gray as a bat and then wonder why Fate is against him and Fortune never came his way. The trouble with many men is they think they are the efficient when they are not. This is oftentimes due to self-conceit or egotism, which can only be cured by a series of failures and disappointments, or by an honest self analysis or inventory of their qualities of mind and store of knowledge pertaining to the particular line of business in which they are engaged.

Essential Qualifications in Lumber Business

This particular article being intended for those who are in the lumber business, it may be interesting to note some of those essential qualifications which are generally conceded to be necessary to acquire one hundred per cent. efficiency in that vocation.

Right here, let it be said, a retail lumberman cannot be efficient with the limited amount of general knowledge or mental requirements which might be sufficient for one hundred per cent. efficiency in individuals engaged in many other vocations. Retail lumbermen are in a class to themselves and must possess just a bit more general know-

ledge, a degree of higher intelligence than is required by many other ordinary mercantile pursuits.

In the judgment of the writer the essential qualifications for one hundred per cent. efficiency in a retail lumberman can be enumerated as follows:

1. Good health.
2. Honesty and integrity.
3. A thorough knowledge of the grades of lumber.
4. Estimating materials; that is, the ability to make up and figure the value and quantities of material used in the construction of all kinds of buildings.
5. Estimating costs; that is, the ability to estimate the costs of labor for the construction of all kinds of buildings.
6. Architecture; a reasonable amount of ability to draw plans and sketches of dwellings, barns, small store buildings, etc.
7. Salesmanship.
8. Law; that is, a general knowledge of the laws relating to liens, mortgages, judgments, executions, attachments, bankruptcy, exemptions, etc.
9. Industry and energy.
10. Sobriety.
11. Judgment; which relates especially to judgment in extending credits and methods of collection of accounts, etc., which also implies a good judgment of human nature and values.
12. Courtesy.
13. Tact; which includes the ability to handle doubtful or delicate business propositions with success, which faculty includes discretion.
14. —System; and sense of order, which implies a knowledge of the value of appearances.
15. A knowledge of bookeeping.
16. Economy; which pertains to expenses, investments, etc.

How to Arrive at Grade

From the above, it appears that there are sixteen essential qualifications or component parts to make up a first-class retail lumberman; therefore, to be one hundred per cent. efficient, as a retail lumberman, the man must grade one hundred per cent. perfect in each of the sixteen essentials above listed. In other words, if the lumberman is only ten per cent. efficient in one essential, twenty-five per cent. in another, and seventy-five per cent. good in another, and so on, through the entire list of essentials, the chances are that he will not grade out over fifty or sixty per cent. efficient on the general average test. If such is the case, this man is not a thoroughly first-class lumberman, even though he might grade one hundred per cent. efficient in his knowledge of lumber and several other essentials, because his shortcomings in the remaining essentials cuts down his average percentage of efficiency.

The question, therefore arises, what per cent. are you efficient as a retail lumberman? Are you only twenty-five per cent. a good lumberman? Or are you ninety-nine per cent. pure stuff? Let's see.

Now for the sake of determining whether or not you are worth the amount of salary you are drawing, and as to whether you are worthy of a bigger or better job, just try to be honest with yourself a few minutes and fill out the blank efficiency test which follows and show to yourself by a mathematical calculation how good a lumberman you are, and how far you fall below the one hundred per cent. mark.

In explanation, take essential No. 1, good health. If your health is perfect, then put 100 in the blank column under the word "Per Cent."

Essential No. 2 is honesty. If you know you are strictly honest, then put 100 in the same "Per cent" column, showing that your are 100 per cent. honest.

Essential No. 3 is knowledge of grades of lumber. If you consider you know all the grading rules, and can tell the difference between a No. 3 board and a piece of finish, then put another 100 in the "Per Cent" column.

Essential No. 4 is estimating materials necessary to construct any kind of building. Here is where you will doubtless have to discount yourself a little; any way, if you think you can get up a correct estimate of the material necessary to build seventy-five per cent. of all the buildings you sell material for, then you are entitled to 75 per cent. in the "Per Cent" column. Remember, this does not mean ability only to figure up the estimate itself, but the ability to make up the estimate of materials.

The next essential, No. 5, is a hard one for the average retail lumberman to get a high mark of efficiency, as very few know very much about estimating costs of construction, yet to eliminate losses on contracts, the knowledge is very essential. You are the best judge of what you know, therefore put down whatever per cent. will most nearly represent your knowledge of that essential. If you conclude that you know only about ten per cent. of what you ought to know about estimating construction labor costs, then put 10 in the "Per Cent" column, and so on down the line, making analysis of your knowledge and possession of each of the sixteen essentials and place your grade opposite each in the "Per Cent" column, after which add it up and divide the total by sixteen (16). The answer will be your percentage in efficiency as a retail lumberman. Try it on the table below.

The Sixteen Essentials for a One Hundred Per Cent. Efficient Retail Lumberman—Self-Analysis Test Table.

1.	Good health	.....
2.	Honesty and integrity	.....
3.	Knowledge of grades of lumber	.....
4.	Estimating materials	.....
5.	Estimating construction costs	.....
6.	Architecture	.....
7.	Salesmanship	.....
8.	Law	.....
9.	Industry and energy	.....
10.	Sobriety	.....
11.	Judgment	.....
12.	Courtesy	.....
13.	Tact	.....
14.	System	.....
15.	Bookkeeping	.....
16.	Economy	.....
	Total	.....

Now divide the total by "16"—the answer will show your percentage of efficiency, which is your proper grade as a retail lumberman.

A Good Word for Canadian Birch

Editor Canada Lumberman:—

Sometime ago I sent you an item on the desirability of Canadians using more of their native woods, and less of the imported woods, and at that time referred particularly to the many good qualities of Birch, not only for finishing purposes, but also for general purposes, where heavy oak and ash are used at the present time. I am enclosing you two newspaper clippings which refer particularly to the qualities of birch. One in reference to the fine finish which can be given it, and another to the fact that birch shrinks and swells very little under any conditions.

Birch makes beautiful furniture and beautiful interior finish for residences, offices and other public buildings, and it seems as though the attention of the architects should be called to this beautiful wood which they are overlooking and for which they specify substitutes that lack the good qualities of birch.

Not only is this doing an injustice to Canadian products, but it has a further effect of taking good money out of Canada to pay for these substitutes that should remain there to build up the country. At present this is a very important feature to be considered.—U. S. Wholesaler.

The first of the items referred to by the writer of the above letter is as follows:—

"A writer in the Furniture Manufacturer and Artisan discusses interestingly the finishing of birch as a high grade cabinet wood. He contends that it should be filled in order to secure the best finish, although very often in the past the filling coat has been omitted. Where used in conjunction with mahogany it should be treated in the finishing precisely as mahogany except that it requires a stronger stain. If the birch parts are first coated with a stain 50 per cent. darker than that used on the mahogany, and if when dry the whole case is then coated with a mahogany stain and the two woods are then treated alike in the finishing, the two will have much the same appearance. This writer, however, contends that birch finished natural or in a light brown shade deserves high rank as a cabinet wood and would receive it if it were an imported rather than a domestic wood."

The second item is as follows:—

"High prices and the increasing scarcity of black walnut lumber have resulted in attempts to substitute other species for the manufacture of gun stocks. The Forest Products Laboratory has received numerous requests for information on possible substitutes and many samples of rough stocks from other species have been submitted to the laboratory for testing. To be suitable for gun stocks the wood must be easily worked; it must be subject to very slight shrinkage and swelling under outdoor weather conditions, and it must be capable of taking a good finish. Of the substitutes being tried birch has probably received more attention and orders have already been placed for this material."

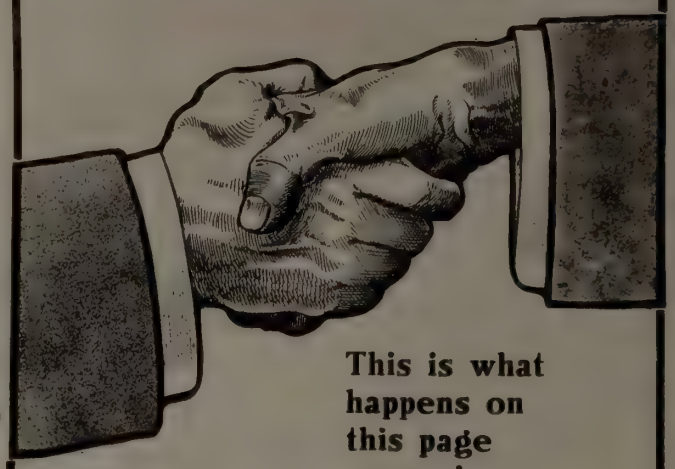
Death of Col. A. D. Davidson

Col. Andrew D. Davidson, who was closely associated with Messrs. MacKenzie & Mann in their C. N. R. enterprises, and in their various lumber manufacturing interests, died on April 22nd at Rochester, Minn., at the age of 63. The late Mr. Davidson held the offices of president of the Canadian Western Lumber Company, Fraser Mills, B. C.; president of the Columbia River Lumber Company Ltd., Golden, B.C., and president of the Big River Lumber Company, Prince Albert, Sask., as well as important positions in a number of other large manufacturing concerns in Western Canada.

The Master of Ceremonies

Mr. Buyer

Are you in the market for a special bill of lumber? Would you like to pick up a real good second-hand planer or perhaps some logging equipment? Have you a vacancy in your plant for a filer or other employee? If you answer "Yes" to any of these, advertise on this page. It is the "Master of Ceremonies" and will introduce you to the man you want.



This is what happens on this page every issue

Mr. Seller

You are looking for the man who is looking for you—you have for sale what he wants. All that is needed is an "Ad" on this page to bring you together. Appeal to this "Master of Ceremonies" and send us a small ad. today. What can we sell for you—or perhaps we can find you a job.

Send along your ad.

WANTED & FOR SALE DEPARTMENT

PUBLISHER'S NOTICE

Advertisements other than "Employment Wanted" or "Employees Wanted" will be inserted in this department at the rate of 15 cents per agate line (14 agate lines make one inch.) ($2.10 per inch. each insertion, payable in advance. Space measured from rule to rule. When four or more consecutive insertions of the same advertisement are ordered a discount of 25 per cent. will be allowed.

Advertisements of "Wanted Employment" will be inserted at the rate of one cent a word, net. Cash must accompany order. If Canada Lumberman box number is used, enclose ten cents extra for postage in forwarding replies. Minimum charge 25 cents.

Advertisements of "Wanted Employees" will be inserted at the rate of two cents a word, net. Cash must accompany the order. Minimum charge 50 cents.

Advertisements must be received not later than the 10th and 26th of each month to insure insertion in the subsequent issue.

Wanted-Lumber

Sawdust Wanted

Wanted to contract for sawdust. Apply M. Brennen & Sons, Hamilton, Ont. 9-10

Maple and Hickory

Wanted, Maple and Hickory Axles, dry. Jackson Wagon Co., St. George, Ont. 8-11

Basswood Wanted

No. 2 Common and Mill Cull. Winter cut preferred. Apply Firstbrook Brothers, Ltd., Toronto, Ont. 8-t.f.

Cedar Wanted

Good cedar for boat building. Best prices paid for the right material. Write for particulars. The Peterborough Canoe Company, Limited, Peterborough, Ontario. 6-9

Wanted to Buy

750,000 ft. 2 in., 2½ in., 3 in. and 4 in. log run Birch. Terms 75 per cent. cash on shipment, balance on arrival. Apply P. O. Box 643, Montreal, Que. 9-12

Wanted

We are in the market for a large quantity of 2-in. Spruce Plank 4 in. and up wide, 8 feet and up long. Good merchantable stock. Kindly write us your lowest price. Box 334, Canada Lumberman, Toronto, Ont. 5-t.f.

Wanted

Several cars 16/4 Birch, No. 2 common and better grade. Must be dry and ready for immediate shipment. Write us your lowest price and full particulars. Box 333, Canada Lumberman, Toronto, Ont. 5-t.f.

For Sale-Lumber

Logs for Sale

500,000 Western Ontario White Pine Logs. Can be sawn to your order. Those interested please write Hall Brothers, 174 Mutual St., Toronto, Ont. 9-12

Hemlock Ties

FOR SALE—Considerable quantity of hemlock ties suitable for Electric Railways, Sidings, etc., ready for immediate shipment. Monteith Bros., Rosseau, Ont. 6-10

Lumber For Sale

200 Pieces 1 x 15 and up 22 ft. Cypress.
375 Pieces 1 x 15 and up 24 ft. Cypress.
Clear for boat building, in stock at Montreal

GEO. C. GOODFELLOW,
Montreal, Que.

For Sale

65,000 Feet GOOD DRY B. C. FIR

2½ to 5 in. thick by 6 to 12 in. wide. 60 ft. to 78 ft. long. Immediate delivery. George Kersley, 224 St. James Street, Montreal. 7-10

For Sale-Machinery

Portable Sawmill

Portable Saw Mill for sale in first-class condition. Capacity 10 M. feet per day. Double edger and everything necessary. Box 388, Canada Lumberman, Toronto, Ont. 8-9

Producer Gas Engine

For sale, second hand 45 H.P. Producer Gas Engine with gas producer, air pump for starting, blower, and small gasoline engine complete and in good condition. Burns pea coal, could be operated at a cost of about $1 per day. Will be sold at a very low price. Canadian-Warren Axe & Tool Company, Ltd., 7-10 St. Catharines, Ont.

For Sale

About 200 9/16 in. Boom Chains, and about 600 ½ in. Boom Chains. 1 set Pine Storage Booms of about 100 pieces, with ¾ in. shackle chains, and 1 set Pine Storage Booms of about 100 pieces with ⅞ in. shackle chains. Also a quantity of White Pine and Hemlock Booms. Box 379, Canada Lumberman, Toronto, Ont. 9-9

Machinery For Sale

A small "Ad" under this heading, telling of what machinery you have for sale, will immediately put you in touch with buyers. Send us a list of machinery items and we will quote you on a small "Ad." Send the list now, before you forget about it. 1-t.f.

Machine For Sale

Two second-hand McGregor-Gourlay O. Y. Planers and Matchers, one 9-in., one 15-in. wide; in good condition, ran every day till October, when fast feed Matcher was installed. Located in Saskatchewan. Box 384, Canada Lumberman, Toronto, Ont. 8-11

For Sale

Stationary Sawmill Machinery, including Engine and Boiler. Capacity 15,000 feet per day. Also Cowan Stroke Mortiser and Fisher Belt Sander. Must be sold at once to make room for extension to sash and door factory. Apply to P. W. Gardiner & Son, Box 209, Galt, Ont. 9-9

Machinery for Sale

Cowan No. 204 Planer and Matcher, 15 x 6 in.
Cowan No. 236 Chain Saw and Mortiser, ⅝-in., 5/16-in., 7/16-in.
Cowan No. 224 Tenoner.
Cowan No. 152 12-in. four side Moulder.
Ballantyne 8-in. three side Moulder.
Ballantyne End Matcher.
Ballantyne Door Cramp, 4 ft. by 8 ft.
McEachren Dry Kiln Heater, 1,000 ft. coil, 36-in. Fan.

Will consider 8-in. four side Moulder in an exchange. All machines are good, in first-class condition, recently new, and some have numerous extra attachments which will be thrown in. We are quitting planing mill business to engage in another line. These machines are in our way and no reasonable offer will be refused.

GALBRAITH & COMPANY, LTD.,
9-9 Owen Sound, Ont.

Wanted-Employment

Advertisements under this heading one cent a word per insertion. Box No. 10 cents extra. Minimum charge 25 cents

BAND SAWYER wants position, left hand mill. Good references. Box 335, Canada Lumberman, Toronto, Ont. 9-9

SAW FILER of 22 years' experience, wants position. Can do any kind of filing or hammering. Box 396, Canada Lumberman, Toronto, Ont. 9-9

Manager Complete Plant wants position, woods, railroad, saw mill. Big proposition wanted, no matter how difficult. Box 389, Canada Lumberman, Toronto, Ont. 8-9

BAND SAW FILER of long experience wants position. Box 398, Canada Lumberman, Toronto, Ont. 9-9

BAND, RESAW OR ROTARY SAWYER wants position. Six years' experience; sober and good references. Box 353, Canada Lumberman, Toronto, Ont. 6-9

BAND SAW FILER wants position, double or single cut. Twelve years' experience, first class references. Box 317, Canada Lumberman, Toronto, Ont. 4-9

DOUBLE BAND SAW FILER wants position, first-class references.

BAND MILL FOREMAN wants position, first-class millwright, and can handle men to good advantage. Box 359, Canada Lumberman, Toronto, Ont. 6-11

Experienced married man, fifteen years' experience, thorough knowledge shipping, inspecting, estimating, travelling, etc. Open for engagement, any time, best references; at present employed, desirous of change. Box 385, Canada Lumberman, Toronto, Ont. 8-9

Wanted-Employees

Advertisements under this heading two cents a word per insertion. Minimum charge 50 cents.

INSPECTOR WANTED—A man capable of inspecting both hardwood and softwood, and shipping same. State references, experience and salary expected. Box 394, Canada Lumberman, Toronto, Ont. 9-12

SALESMAN WANTED—One with good connection amongst consumers of Canadian Hardwood Lumber through Ontario and the United States. Good opening for the right man. Must be experienced. Address Box 48, Canada Lumberman, 119 Board of Trade, Montreal, Que. 9-9

Business Chances

Sawing Contracts To Let

We are prepared to let contracts at once for two or three portable or semi-portable saw mills to cut hemlock, hardwood and some pine on McKenzie Township near Parry Sound. Jobs will run from one million feet up, amounting in all to about fifty million feet. Would like to include some manufacturing and lath and shingles. Write at once, giving full particulars and experience and references.

HOLT TIMBER COMPANY, LTD.,
8-9 c/o Canada Lumberman, Toronto, Ont.

Business Opportunity

Make your opportunity knock at the door of every Lumberman in Canada by placing a small "Ad" about it in this column. Our rate is $2.10 per inch per issue. Now is a time when monied men are seeking good bargains. What have you to offer? 1-t.f.

Miscellaneous

Timber Limits For Sale

Berths No. 2 and No. 4 Nipissing, and Berth No. 4 Cook. Hemlock, Birch, Pine and Spruce. Would sell berths separately. Close to Lake Nipissing. Great opportunity for jobbers on Nipissing berths. For particulars address Box 381, Canada Lumberman, Toronto, Ont. 7-10

30 Replies

are often received to "Wanted" and "For Sale" ads. on this page. Even 50 replies are not an uncommon return from the investment of the small amount a condensed ad. costs. And isn't that good business—to get right into close touch with so many people interested in what you have to buy or sell? For you can be sure their transactions with you will not end when they have closed the business your single ad. announced.

Woods Used for Specialties

The making of toy furniture is a line that has been growing fast during the past few years. Some special machinery has been devised to turn this work out and it means much work to make the things which mean play for the children. Nail-driving machines are used and the articles are dipped in a vat and not hand painted. They are decorated by hand and thoroughly inspected. Most of these are made in the New England states.

Most of the bamboo broom handles used in the United States come from Amsterdam, N.Y., and are imported from Japan. When they were first brought here they proved unsatisfactory, as they cracked and split. The newer methods prevent this. George H. Maus, of Amsterdam, imports most of them and he has started a hardwood broom handle factory in Japan.

The writer has been through several of the pencil slat factories, used to make pencils and it is a big industry. Trade has been cut off from Germany and Austria and there is a good deal of secrecy about the work after it reaches the pencil slat condition. Most of the wood used is red cedar from the South, some incense cedar from California and for cheap pencils white pine and basswood. The United States exports more pencils than it imports. There are eleven pencil factories in the United States and a new one in Toledo to be built, to cost $200,000. About 200,000,000 lead pencils are made in the United States each year.

Apple wood has been used considerably in the making of briar wood pipes.

The making of sporting articles of wood is carried on to a large extent. Base ball bats are made of ash, maple and hickory. Elm goes into gymnasium goods and red oak into horizontal bars. White cedar and white pine are used for fish net floats, polo sticks and hockey sticks of white oak. ash and hickory. English beech was once used for the heads of golf sticks, but now they are made mostly of dogwood and persimmon. Yellow poplar and chestnut are used much for billiard and pool table tops. Hickory is used for ladder rungs and spring boards; sugar maple for tenpins, lignum vitae for bowling balls, and dogwood is sometimes used for the latter. The legs of billiard tables are made of red oak. The billiard and pool table racks are of white and red oak, cushion rails of oak and ash. Bowling alleys consume shortleaf pine, also a lot of sugar pine, hemlock and spruce.

The inside frame work of billiard and pool tables is elm, white pine, spruce, chestnut, yellow poplar and basswood. The billiard cues are made of sugar maple, rosewood, Circassion walnut, black walnut and ebony. In some sections beech, ironwood and willow are used for cheaper baseball bats. The triangle used to set pool balls is made of cherry. White ash is used for polo and hockey sticks and tennis racket frames and hammock frames of birch, and black walnut for gun stocks.

For woodbending the wood was once immersed in hot water vats, but now it is steamed under high pressure in retorts. It is used largely for rims, shafts, wheels, etc., and must reduce breakage to a minimum.

For bicycle rims maple is genenarally used, and it has advanced considerably in price. It is resilient and adds to the life of the tire.

Large quantities of canes, umbrella and parasol handles are made in Pennsylvania and New York. For the shanks sugar and soft maple are generally used, and beech for the handles. The crooked sticks are straightened by placing in hot sand. Many high priced canes are made of malacca wood, some selling as high as $100. Beech, mahogany and ebony are also used for the umbrella handles and many imported woods are used for these lines.

Woodenware such as pails, buckets, snow shovels, traps, etc., are getting to be quite a line of work. The mouse traps are made of beech, maple, red gum, white elm and yellow poplar. Bowls, dishes, butter cups, tubs, plates, rolling pins and spoons are made of red spruce, white pine, balsam fir and hemlock, also some mahogany, black walnut, cherry, sycamore, white ash and white oak. Sugar maple, beech and paper birch are used much for plates and dishes. Breadboards are made of basswood, cottonwood, white cedar, maple and birch. Elm is used in some of these lines.

Review of Current Trade Conditions

Ontario

Weather conditions and holidays have been rather against trade activity in the lumber business during the past fortnight. The Easter holiday invariably creates something of a lull for a few days preceding and following the Easter season. This has been strongly marked during the present year. Weather conditions have been unfavorable in connection with the country demand for lumber. Backward weather has prevented the farmers from coming into the market with their lumber requirements and it is likely now, that farmers will be too busy at their ploughing and seeding to give much time to buying lumber or putting up buildings and improvements. Travellers who have been visiting Ontario districts report that this condition is pretty general and that most of the farmers are away behind in their work. There are no features of definite interest in connection with the trade in soft woods in Ontario. The demand from country retailers is quiet and in the cities there is practically nothing going on in the way of building operations. It is expected, however, that when fine weather has become permanent the city trade will show some improvement. At present, however, there is really not as much enquiry for stocks as there was a few weeks ago. A curious situation in connection with general trade conditions in Ontario today, is the fact that, although building operations are so greatly reduced, some other lines of trade are quite active, for instance the piano trade is enjoying an excellent volume of business. Apparently people are buying pianos now who would scarcely have been considered prospective purchasers a few months ago. Evidently there is a good deal of money in circulation, but it does not seem to be headed very strongly towards the lumber trade. A case of rather similar interest is that of the jewellery trade. We are told that retail jewellers are doing a very satisfactory business today. Possibly this situation may be accounted for by the fact that many wage earners who formerly were only employed for a portion of the year are now enjoying steady employment at increased wages and are spending money on such articles of luxury. A fair sized movement of stock is still in progress in connection with the shell box business, which is about the only active line in the softwood market in Ontario.

In the hardwood trade, conditions are very different from those in the softwood trade. Orders are somewhat mixed, but quite plentiful, and many hardwood firms find that they have had the best four months' trade this year that they have had since the commencement of the war. Piano factories are very busy and furniture factories are buying to a fair extent. The wagon factories generally seem to be quite busy. The trade in hardwoods on the other side of the boundary line is remarkably active. The greatest difficulty in connection with hardwoods today is in getting stocks. Dry stocks are almost out of existence. The cut of hardwoods in Ontario is expected to be about 25 per cent. less than formerly. One of the best lines on the market today is 2 in. and 3 in. soft elm which is used for a variety of purposes, an important use being for the uprights for piano frames. There is a very strong demand for this line and stocks are scarce. The demand for 1¼ in. birch is strong. These are the only features, but the rest of the hardwood market continues active and strong, with very light stocks. Much of the present buying movement in connection with hardwoods is accounted for by the fact that for some time the manufacturers using hardwoods have been allowing their stocks to run down. In fact there has not been such buying activity since before the war.

Eastern Canada

The St. John market shows very little change so far as Trans-Atlantic markets are concerned. Practically all of the trade now going on is with the Allies and their orders are much sought after. The shipping situation continues to show record prices for tonnage. Charters have been made at 360 shillings, which is an advance of 60 shillings during the past few weeks. English deal prices remain unchanged.

The American market continues to improve. Railway companies have recently raised their embargo and helped the trade greatly. A base price of $28 for spruce at Boston is now frequently quoted and $30 does not seem unlikely in the near future. Lath are also higher and selling at $3 to $3.25 on the wharf at St. John. Shingles are quiet. The driving situation is encouraging. Although a large jam of logs developed at Grand Falls on the St. John River about the middle of the month and subsequently broke, the St. John River Log Driving Company managed to gather them all in without any loss, as they floated down the river.

At Montreal, there is a good demand for U. S. account. Local trade is quiet, but the country trade is a little better. The export situation is still uncertain on account of vessel shortage and it is expected that the high freight rates will reduce the volume of shipments.

The market for spruce at Boston has been strengthened considerably by the removal of the last railroad embargo effective against lumber of the New England line. The base price of spruce frames has advanced and is firm, at $28. Many of the largest spruce mills are very busy. There are plenty of important enquiries in hand and the outlook generally is promising. Random also is firmer. Prices now range as follows:—2x3, $21.50 to $22; 2x4, $22.50 to $23; 2x5 and 2x6, $21.50 to $22; 2x8, $25 to $25.50; 2x10, $26.50 to $27; 2x12, $27.50 to $28. At New York, the spruce market continues strong in all sizes and grades. There is a fair demand for hemlock at Boston. The removal of the railroad embargo has also helped this wood. Some manufacturers are refusing anything under $23 for dry hemlock boards. The price, however, seems to be from $22 to $23. Warmer weather is bringing out the demand for shingles at Boston and prices are firmer. White cedar extras are bringing up to $3.50 for the best. Clears are selling at $3.10 to $3.20. Red cedars are at $3.68 for fair extras to $3.88 for the best. Lath are in good demand and the price tendency is upward. For 1 5/8 in. the price is $4.20, or perhaps a shade less, for some lines, but some manufacturers are asking $4.25. For 1½ in. the lowest price is $4.

Great Britain

A fairly active trade is reported on the spot market in London, in spite of all the difficulties attending it. Values continue to advance, as the cost of new arrivals is greater than was expected because of increased freight rates and the difference in exchange. Hand-to-mouth business is the only kind in progress. Statistics of the London dock stocks, showing conditions just before the opening of navigation, are interesting. European deals and battens, rough boards and prepared boards show increases as compared with last year. Decreases are shown in Canadian pine goods and increased in spruce battens. At Churchill & Sim's recent auction sale a lot of 3 x 8 in. second, red pine, from Montreal, 10/26 ft. brought £29 5 shillings. Red pine from St. John, 3 x 8 in., 11/19 ft., 2nd and 3rd brought £26 5 shillings.

At Liverpool, trade is characterized by absence of offerings, rather than lack of demand. The result, however, is comparative inactivity. During the past three months, the price of tonnage from Canadian ports to Liverpool has increased from 170 shillings to at least 330 shillings, with every possibility of 350 shillings in the near future. Steamer tonnage has been very short all along and it is feared that the large quantities of sailing vessels which assisted last season will not come forward to such a great extent this year. This idea is held in Liverpool, although there is apparently no very definite basis for it as yet. The tonnage question will be the crux of all future business, and still higher prices seem inevitable.

At Glasgow, trade has been quiet during the past fortnight, conditions being similar to those at Liverpool, with meagre imports and a good demand. One or two small parcels of spruce which arrived recently created fresh records in the way of prices. There is practically no possibility of a reduction in price so long as supplies come forward on the present modest scale. Birch planks have met with rather more enquiry. It is understood that a few contracts for Quebec birch logs have recently been completed.

United States

During the past fortnight, the lumber trade in the United States along with practically every other line of industrial activity has been in an uncertain state on account of the overhanging possibility of war with Germany. There has not been any noticeable change in the volume of trade, but business men have all been discussing freely the possibility of war being declared and the results which it will have upon business conditions. At present, however, the chief point of importance in connection with the whole business situation in the United States is the fact that since the commencement of the war in Europe its trade balance has been increasing rapidly in its favor, as a result of its great crops and of the assistance given by bankers in the United States, and by large financial corporations, in financing the production and shipment of goods required by foreign trade. Current trade of all kinds in the United States was never better than it is today and there is good prospect of the volume continuing on its enormous scale for months to come.

In the lumber industry, the indications are strong that during the

SARNIA, ONTARIO

B. P. Bole, Pres. F. H. Goff, Vice-Pres. E. C. Barre, Gen. Mgr. W. A. Saurwein, Ass't. Mgr.

next few months there will be a heavy demand. The steel business which has been exceptionally prosperous, is even growing more so. Railroads never had heavier traffic to handle. Farmers generally are prosperous and are likely to be in funds for some time to come. Workmen throughout the country are receiving good wages. Money for building purposes can be obtained easily and reports from the large and small cities and communities show that extensive building will be done this year. The present material prosperity means an enormous demand for lumber. The Southern pine situation shows no important change. The outlook is for an extensive demand and continued difficulty in making shipments on account of car shortage. For the week ending April 22nd, 159 Southern pine mills reported orders on hand for 27,570 cars, or 550,848,600 feet. Shipments during the week amounted to 5,023 cars or 100,359,540 feet, leaving a balance of orders on hand of 22,547 cars or 450,898,060 feet.

The car situation continues to affect the hardwood trade considerably. A slight reduction in sales is reported of late, due almost entirely to difficulty in making delivery. Northern hardwoods have also been a little less active, but this is said to be the result of lack of mill stocks. Maple and basswood are strong.

The market for Northern pine is quiet. Buyers are reported to have good stocks on hand and are waiting for developments. Northern pine prices remain firm. A slight stiffening in price is reported for hemlock on some items and the difference between hemlock and yellow pine prices is narrower than it has been for some time.

Market Correspondence

SPECIAL REPORTS ON CONDITIONS AT HOME AND ABROAD

St. John Trade—American Market Improved

St. John, N. B., April 25th (Special to the Canada Lumberman) :—Very little change has taken place in the St. John market in respect to the shipment of lumber. It goes steadily onward, but if the price of lumber only advanced as do freights, the lumber manufacturers would become so wealthy they would not know where or how to invest their riches. But this is not the case. Prices remain the same, while today some charters have been made at 360 shillings, an advance of 60 shillings during the past two weeks, and though it is said that even higher rates will be paid, no one is capable of judging. English deal prices remain the same, about $18 to $19 per M., but it seems as if the buyers are afraid to venture, and parties having deals to sell today are unable to find purchasers. What the future months may bring forward remains to be seen. Really the only buyers today are the Allies, and their orders are much sought after by all the shippers.

The American market shows a further better tone during the last two weeks, especially since the lifting of the embargoes on the railways, which allows the purchaser to place his order and then feel reasonably sure of getting shipment. Twenty-eight dollars is now a much spoken of base at Boston and one would not be surprised if $30 were the base before long. All the widths have moved up in conjunction with the base price, if the embargoes on the railways should be kept off, a good market should prevail for American sizes.

Laths also have moved up, in keeping with long lumber prices, and are well sold here at $3.00 to $3.25 on the wharves.

The shingle market is not like the rest but still remains dull and dead, with evidently nothing ahead to show any improvement.

The river from Fredericton to Grand Falls is free of ice, having run out early last week. This makes a clear river for two hundred miles, from St. John up. The St. John River Log Driving Company have completed setting their booms and have been very fortunate in catching the many logs which were scattered from the Grand Falls to St. John, supposed to total three to four million feet. If these had escaped it would have meant a serious loss to everyone concerned. Bank logs are now beginning to come into St. John and are bringing about $14 per M. for spruce deal logs, $10 for spruce 8 in. to 10 in. butts, $8.00 for spruce pulp wood and fir. These are about last year's prices.

Montreal Reports Good U. S. Demand

Montreal, April 26th (Special to the Canada Lumberman) :—The most important feature in the Montreal trade today, is the good demand for United States account. Orders have substantially increased of late, and prices obtained are said to be satisfactory. Some shipments are delayed, owing to a shortage of cars. Local business is quiet, the building trade showing no signs of activity so far as the city is concerned. Reports from the country districts, however, are more favorable, although the work is not as a rule of individual importance.

Apart from the firms making shell boxes, trade in the box section is dull. The Dominion Box and Package Company has obtained an order for 30,000 shell boxes.

The outlook for export is still uncertain, with the chances in favor of a considerable reduction in the shipments. Shipping companies have no further space to offer, at present, and when the season opens it is likely that rates will advance further. It is probable that if the goods are urgently required on the other side the Government will have to arrange for boats, as the regular liners hold out no hope of any large amount of space being available for lumber.

The sulphite pulp market continues in a very strong position, with prices still higher. Indications point to a further shortage in European supplies, owing to difficulty in procuring coal and in shipping production. Enquiries from the United States are still numerous. The ground wood situation is better, due to the heavier consumption. Newsprint is also in good demand.

The Railway Companies recently gave notice of an increase in rates on wood pulp from certain Canadian pulp points to United States paper mill points. The average increase was 6½ per cent., the contention being that the railways were following a corresponding increase made over the border. The companies interested protested, and the Railway Commission have suspended the order from going into effect on May 1st, as proposed by the railway companies, and have promised a hearing to the pulp companies.

Glasgow Quarterly Report

Edmiston & Mitchells, Glasgow, Scotland, in their Quarterly Timber Circular, say in part:—The opening quarter of the year has witnessed considerable activity in the Timber Trade of the Clyde, though it is a matter for regret that it is mainly to be attributed to war requirements, and to that extent may be deemed unsatisfactory. The belief that there might be a shortage of supplies, and that in view of the scarcity and dearness of freights higher prices were almost inevitable, encouraged a certain amount of speculative buying, which helped to convey the impression that business was more active than was actually warranted by the ordinary legitimate trade requirements of the market. The outstanding feature, so far as the year has gone, is a steady inflation of values which embraced all varieties of timber, and is due more than anything else to constantly advancing freights, which in many instances represent two or three times the free-on-board value of the cargo. A further factor influencing values was the action of the Government in prohibiting imports from 1st March, except under special permit, of mahogany, black walnut, poplar, gum, basswood, maple, and from 31st March of oak, elm, birch and beach. Licenses will only be granted for these if a guarantee be produced that they are to be used in the execution of Government orders, but there will be the difficulty of securing guarantee, and even then it is to be feared that the giving out of permits will be a slow process, so that there is bound to be a serious restriction in such imports for the duration of the war.

Shipbuilders, who are still mostly engaged on Government work, have shown more disposition to buy of late, doubtless due to the fact that they are now able to devote some little attention to mercantile work, but it is improbable that the consumption in this direction will undergo any decided improvement over the duration of the war. Boxmakers have been very busy, chiefly on Government work, and there is a large consumption of white pine to record. Wagon-builders are well employed, although their endeavors at present are centered to a large extent on war work. There is no improvement in housebuilding, nor is there likely to be until the costs of labor and material return to a more normal level. Cabinetmakers have experienced moderate trade, but with the import of furniture woods now prohibited, the outlook for this industry has assumed a darkening aspect.

As regards the statistical statement, the imports are in excess of the same period last year by about 12 per cent., but are rather less than the first three months in 1914. The total consumption shows the remarkable increase of about 30 per cent. as compared with that for the corresponding period in either of the two preceding years, and is chiefly due to the large movement which has taken place in white pine; but notable increases are also recorded in the case of pitch pine, clear spruce, teak, and in whitewood, oak, and gum leather. With regard to the stocks remaining on hand at this date, while they are nearly 20 per cent. over the figures for this time last year, this is brought about by the great increase in the holding of white pine, nearly all other items showing a decrease. It is perhaps more interesting to note that

Manufacturers of Lumber

Extensive New Brunswick and Quebec timber limits, abundant with Virgin Spruce, Pine and Hardwoods.

Twenty years' experience in Milling and Manufacturing, together with a practical knowledge of Building and Architecture, is why our Customers tell us that the Dressing, Grading, and Manufacture of our Stock is just a little better than they expected.

Large stocks of 1 in. Spruce Lumber always on hand.

Try a car of our Air-dried Dressed Spruce.

We also make a Specialty of Kiln Dried Stock.

Our personal attention given to every detail.

Write, wire or phone us for quotations.

Established 1894 ***Incorporated 1908***

Campbellton, New Brunswick

there has been a shrinkage in stocks since 31st December last of about 25,000 loads, or 25 per cent.

The output of tonnage on the Clyde for the first quarter of the year is only five vessels of 17,580 tons, against last year's figures for the same period of 104,000. This at first sight would appear to imply that local shipbuilders are not busy, which is far from being the case, the explanation being that no figures are allowed to be published of war vessels, which form the bulk of those launched.

Imports from British North America.

Yellow pine logs—A few sales of first quality wood, mostly of deckwood sizes, were reported from stocks at prices which have ruled rather firmer, but a good deal of the buying was of a speculative nature and has not affected the actual consumption. Shipbuilding requirements are still inextensive, and the stock on hand seems ample to meet all demands for a long time yet.

Oak logs—A good demand has been in evidence for 1st class timber, and the small stock carried over from last year has now been exhausted. A few sales of 2nd class wood were reported, and there is now little even of this quality available in the market. Values have shown considerable appreciation. This wood has been placed on the Government list of prohibited imports.

Elm logs—First class rock elm of large average has met with good request, and high prices have been obtained for parcels of this description, the stock of which is now very light. The movement in other qualities and specifications was quiet, but values have fuled very firm. This wood has been placed on the Government list of prohibited imports.

Birch—Logs: With no stock in first hands, selling was purely of a retail nature. Some little contracting business has been done on a c.i.f. basis at firm prices. Lumber: Planks have met with demand, and sales were reported from stocks at much enhanced prices. This wood has been placed on the Government list of prohibited imports.

Yellow pine deals and sidings—The lower grades have met with good demand, the stock in first hands having been cleared out, and values on same have shown very considerable appreciation. First and second qualities have, however, proved more difficult of sale. Contracting has been on a small scale this year, buyers being disinclined to enter into commitments at the present high prices, and especially on the f.o.b. basis.

Spruce deals—The import was on a restricted scale and quite inadequate to meet the active demands which have existed and which have been maintained despite the steady and extensive rise in values. While the stocks on hand are shown at 11,000 standards, they are held almost entirely on account of merchants and consumers. A fair amount of contracting business has been transacted, chiefly on the f.o.b. basis, at high prices.

Liverpool Market Report

Smith & Tyrer Ltd., Liverpool, Eng., in their monthly market report say:—"The question of tonnage is still the dominating factor of the situation. Government action, which has embraced an extension of the list of prohibited wood goods, has not so far had any appreciable effect upon the problem of overseas space. It seems certain that we shall be faced by a shortage of tonnage throughout the coming season. Spruce deals have appreciated in value, and, owing to the difficulty in obtaining tonnage, and the meagre liner space allotted to the shippers, the quantity offering is small and it is readily sold. There is nothing in sight to presage any weakening in prices. Hemlock is readily placed. Birch, owing to the prohibition of the import, has risen rapidly in value. Pine is firmly held and sellers are having their own way. Pacific Coast woods are still hampered by the difficulties in getting stock forward."

London Market Report

Churchill & Sim in their Wood Circular, under date of London, April 5th, say: "The total deliveries for March from the Port of London correspond closely to the aggregate recorded in March, 1915, the returns being swelled owing to the heavier importation from the Southern Swedish ports, from which buyers for overside delivery have preferred to draw their supplies, coupled as the quotations have been with a definite rate of freight, and prompt delivery, rather than to commit themselves to what they consider to be the more uncertain conditions governing f.o.w. business from the Northern districts. The London market for available sawn stock has shown increased firmness, especially for deals of the lower grades of White Sea and Swedish productions, and for the thinner rough boards. Whitewood has been in good request, and the demand appears to be running upon stock suitable for case making than upon building timber. The heavy demand for floorings and scantlings which emanated from special requirements caused primarily by the war has been satisfied for the time being, and buyers have not been forced by any shortness of stock to look far ahead for their supplies up to the present, so that they are still disinclined to modify the terms upon which they are prepared to enter into wholesale transactions ahead.

"From the St. Lawrence there has been imported—Pine Deals, 2,000 pieces against nil pieces in 1915; Spruce Deals, 3,000 pieces against nil pieces in 1915; and from New Brunswick, etc.—Pine Deals, 2,000 pieces against nil pieces in 1915; Spruce Deals, 109,000 pieces against 543,000 pieces in 1915; Birch Planks 25,000 pieces against 1,000 pieces in 1915.

"Importations of spruce from the Lower Ports dropped off considerably during March owing to the great scarcity of freight room. The demand in the London district has run largely on white-wood, which has reduced the spruce stock at the docks, and for most sizes higher prices have been realised.

"The demand for pine deals has been intermittent, but third and fourth qualities in regular sizes are stronger, in sympathy with the current values of North of Europe stock. The demand for birch planks continued during March and prices were again higher."

B. C.'s Trade Diminishing for Lack of Vessels

In a special despatch to the Toronto Globe, from its correspondent Mr. Norman Lambert, under date of April 17th, mention is made of the great necessity for increased shipping facilities on the Pacific Coast. "The life of this port, before the declaration of the war in Europe," Mr. Lambert says, "was sustained mainly by the transpacific C. P. R. boats and by the many foreign freighters which used to call here on their voyages from one continent to another, or en route around the world. Nearly all the C. P. R. boats have been commandeered by the British Admiralty, and the foreign ships evidently have found more business elsewhere. Only four ships have visited Vancouver from Europe in the last six months. The trade in lumber, which British Columbia might be developing with such countries as France, is going to rival ports owing to the lack of ships. While there is idleness here, the business man in Vancouver can look across to Seattle, and see the harbor of that city bustling with commercial activity. At this moment, so the report states, in Vancouver, a French Government order for 200 million feet of lumber is being filled from the mills of the Puget Sound territory, just across the line. The Government of British Columbia, in conjunction with the Boards of Trade of New Westminster, Vancouver and Victoria, recently sent a man to the West Indies and to South America as a special commissioner to blaze new paths of trade for the products of this Province. This agent's work was found to be quite abortive at the present time through the absence of any adequate means of transporting goods from this port to those countries which he had visited."

The report concludes with a plea for the appointment of a Canadian Custom's officer at New York, so that the haul on shipments between western and eastern Canada by way of the Panama Canal may be shortened by entering the goods in bond at New York and shipping them over land.

Large Bond Issue Underwritten

The James D. Lacey Timber Company of Chicago has underwritten the entire Arkansas shortleaf yellow pine timber bond issue of the Ozan Graysonia Lumber Company, amounting to $675,000. The issue is of first and refunding mortgage 6 per cent. gold bonds in denominations of $1,000, $500 and $100, and these are selling at par and accrued interest.

The Ozan-Graysonia Lumber Company is a consolidation of the Ozan Lumber Company, of Prescott, Ark., and the Graysonia-Nashville Lumber Company, of Graysonia, Ark. Its president and general manager is W. N. Bemis, who has a long successful experience as shortleaf yellow pine operator in the South. Previous to the consolidation Mr. Bemis was president of the Ozan Lumber Company. The Graysonia-Nashville Lumber Company, a subsidiary of the Grayson-McLeod Lumber Company, is owned by the heirs of the late William Grayson and by N. W. McLeod, president of the German Savings Institution, of St. Louis, Mo.

The following are the officers of the company making the bond issue: W. N. Bemis, president and general manager; W. E. Grayson, vice-president; T. W. Rosborough, vice president and assistant general manager; Inghram Grayson, secretary and treasurer; directors—Henry S. Priest, St. Louis; W. N. Bemis, Prescott, Ark.; J. W. Bemis, St. Louis; W. E. Grayson, St. Louis; William Grayson, St. Louis; George H. Grayson, Graysonia, Ark,, and Duncan McRae, Prescott, Ark.

The security for the loan consists of 67,391.60 acres of timber lands of Clark, Pine, Howard and Montgomery Counties, Arkansas, (61,052.74 acres owned in fee—6,338.86 acres timber only), which it is estimated will cut 292,997,000 feet of Arkansas shortleaf yellow pine and 6,850,000 feet of white and red oak timber. Other details of the bond issue are being furnished the timber bond buying public by the James D. Lacey Timber Company, which has its office in the McCormick Building, Chicago.

The trustees of the bond issues are the Mississippi Valley Trust Company, St. Louis, Mo., and the Michigan Trust Company, of Grand Rapids, Mich.

Forest Products Exports Still Increasing

Canada's exports of forest products for 12 months ending January were valued as follows:—1916, $51,211,820; 1915, $41,523,344; 1914, $42,707,781; 1913, $42,873,710. Imports of wood and manufactures of wood for the 12 months ending January 1916 amounted in value to $8,406,841 which is only a little more than one half the total for the corresponding 12 months ending January, 1915, when the total was $16,373,044.

Details of the exports of wood and manufactures of wood for the 12 months ending January are as follows:—

Logging and Market Conditions in the West

The Pacific Coast Timber Bulletin, issued by James D. Lacey & Co., at Portland, Ore., under recent date, says in part:—Following a prolonged season of weather that made logging impracticable, lumbering operations are opening up very actively throughout the entire West. Orders and shipments exceed production and prices are holding steady or advancing. Many mills and factories have all the business they are willing to take on in the face of other conditions which make against the fullest activity. A log shortage has existed but it will be overcome as soon as the loggers have recovered from the damage done by severe and continued storms. At Portland there has been an excess of ten inches of railfall. Along the entire coast weather conditions have been so bad that woods operations are impossible in some localities and difficult everywhere. There is much speculation as to what the log situation will be a few weeks hence. Many camps are starting up and an over-supply may follow; but the demand will be determined by the ability of manufacturers to ship their output. Logs were advanced to $7, $10 and $13, but on Columbia River prices have now returned to $6, $9 and $12. On the Sound it is said that as high as $14 is bid for No. 1 fir logs. The car shortage is very serious, particularly on Puget Sound, where the side-tracks are filled with loaded cars awaiting vessels. On Columbia River lumber production is curtailed by car shortage at the terminals. Manufacturers and dealers are compelled to pass orders on account of uncertainty regarding shipments. The average selling price of lumber is now around $13.50 as against about $9.50 a few months ago. It may now be said that the cost of production is returned, plus a fair margin to apply against stumpage and plant depreciation. A very important part of the business received is coming from railroads as formerly. All kinds of supplies are sold at advanced prices. Donkey engines formerly sold for $4,800 now cost $6,000. Wire rope is high and scarce. Difficulty in securing steel products, and the high prices demanded, is turning builders back to wood construction.

In this connection it is very gratifying to note that the situation is shaping itself very favorably for wood. Unquestionably much wood has been displaced by steel and concrete because of apathy upon the part of lumber manufacturers and disregard for proper attention to the requirements of structural engineers. Through the helpful efforts of the lumbermen's associations co-operating with technical experts the possibilities of wood are being shown and developed and if the industry shall now apply itself to intelligent adaptation of its products to their best uses the business now offered through force of circumstances may be retained under all conditions. West Coast Lumbermen's Association is forcefully demonstrating the effectiveness of organized expert effort. Given the support of all who are concerned with the future of the forests of its territory it will pull the Douglas fir industry out of the hole into which it fell. It deserves the earnest support of every timber owner and operator. Although the highest degree of efficiency cannot be attained in the industry until it has been organized as other great industries are organized, association work is a long step in the direction of stable business.

Redwood operators in California have organized an association for the purpose of making known the merits of redwood. It should aid greatly in stabilizing the redwood industry. The shingle branch of West Coast Lumbermen's Association has inaugurated a forceful campaign in behalf of Western Red Cedar shingles. All of the faults of earlier manufacturing will be avoided in the association's branded "Rite-Grade" product and the displacement of shingles by inferior "patent" roofings will be halted.

British Columbia proposes to enact legislation by which 25 per cent. of all net profits of business over and above 7 per cent. interest will go to the Government. If enacted into law this measure will retard industrial development, particularly in lumbering which at best is a hazardous investment that is justly entitled to more than 7 per cent.

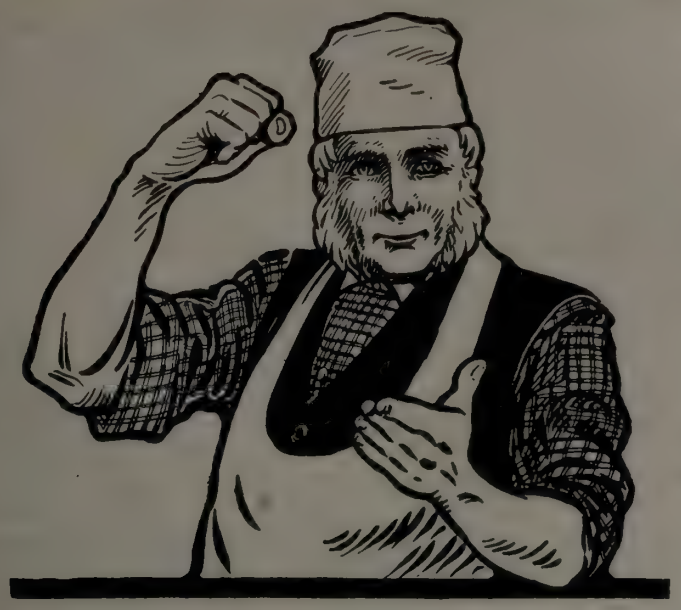
Shipbuilding Boom in Full Swing

Press reports which have recently appeared in many daily papers state that a shipbuilding boom is in progress throughout Canada and the United States, and that probably more vessels will be built during 1916 than in any year during the past 25 years. United States yards are said to have sufficient contracts on hand to keep them busy for three years. There are under construction in the United States at present 252 vessels of more than 1,000 tons each, exclusive of war ships. Shipbuilding activity on the Great Lakes is very pronounced. Cleveland claims 46 vessels under construction costing over $8,000,000, and 30 others under negotiation. Toledo has contracts for an aggregate tonnage of 30,000. Michigan yards will launch 100,000 tonnage during 1916. Chicago has a number of large freighters under construction. Eighty vessels of 500,000 tons have been sold on the Great Lakes this year. Cleveland at present is negotiating for the construction of twenty-eight 3,000 ton freighters. The excessive freight rates prevailing on the Atlantic have caused a revival in ship-building in the State of Maine.

Heavy Freight Movements to Prairie Points

W. B. Lanigan, assistant freight traffic manager for the Canadian Pacific Railway lines, west of the Great Lakes, who was recently in Nelson, B.C., stated that the records of his office showed a decided and steady increase in the quantity of freight being handled by the railway company. Apart from the great wheat crop, more freight was moving now than at the corresponding time previous to the war. The enormous increase in the movement of lumber, he said, was due to the large crops on the prairie provinces, and to the excellent work of the B. C. Forest Branch in advocating the use of B. C. lumber on the prairies. Yards on the prairies had depleted their stocks greatly, and he expected that B. C. manufacturers would be hard pressed to keep up with the demand. The C. P. R., he said, was making arrangements to supply many extra cars for the transportation of lumber to prairie points.

The late Donald Fraser Sr., Fredericton, N.B., made provision in his will for the construction of a modern new building to take the place of the Auld Kirke, which is now utilized as a Sunday School and Auditorium for church purposes by St. Paul's Presbyterian church at Fredericton. It is estimated that the new building will cost between $25,000 and $30,000. The late Mr. Fraser is also reported to have provided for the construction of an annex for Victoria hospital, Fredericton, at a cost of about $30,000.



You get a man's heart through his stomach

says ye olde miller

This is not a lesson in anatomy, but a truism. To earn the good-will of the men; to induce them to produce more and better work, give them good wholesome food. Let their bread be made of

Cream of the West Flour

the hard wheat flour that is guaranteed for bread

It will build them, nourish them as no other food possibly can.

Personal and Trade Notes

It is reported that the Chicoutimi Pulp Company contemplate the erection of a sulphite plant.

Mr. J. E. Levie of W. and J. Sharples, Quebec, sailed from England on April 22 to return to Canada via New York.

Hon. Jules Allard, Minister of Lands and Forests in the Quebec Government, has been appointed a member of the provincial Legislative Council.

Geo. H. Millen, president and manager of the E. B. Eddy Company Ltd., Hull, P. Q., completed fifty years of service with the company on April 14th.

Mr. John S. Bates, Ph.D., Director of the Forests Products Laboratories, Montreal, was recently married in New York to Miss Jeannette Ingraham, daughter of Mr. and Mrs. J. W. Ingraham, North Sydney, N. S.

The B. Jahn Shingle Mill recently started by a company composed of Hindus at Langley, B.C., is operating on a night and day shift and cutting an average of 75,000 shingles every 24 hours, with a good demand for its output.

Lieut. H. W. Racey, who was in charge of the Montreal section of the 224th Overseas Forestry Battalion, has been promoted to a captaincy. He was formerly connected with the St. Lawrence Pulp and Paper Corporation, Chandler, P. Q.

Specifications for several million feet of Douglas fir required by the South African Government have been received in British Columbia by officials of the Forest Branch. Owing to the scarcity of ships, however, it is difficult for B. C. lumbermen to effect delivery.

S. H. White & Co., Limited, of Sussex, N.B., will cut over 10,000,000 feet of spruce, with a small percentage of pine and hemlock this season. Their five mills will all be operated, located at Pollett River, Colis Island, Rockwell, Jeffries Corners, and New River, all in New Brunswick.

According to an amendment to the Forest Act which has been placed before the B. C. Legislature by the Government, power is to be given to the Lieut.-Governor-in-Council, under certain conditions, to permit the export of unmanufactured timber from the province, during the continuation of the war.

The 83rd Battalion, Canadian Expeditionary Force, which has headquartered at Toronto during the winter, left for overseas on April 25th. Major R. S. Wilson, of the Wilson Lumber Company, Toronto, is second in command of this Battalion. They expect to go into camp upon their arrival in Great Britain.

The River Ouelle Pulp & Lumber Co., St. Pacome, Que., will cut 20,000,000 ft. of spruce and 6,000 cords of pulpwood this season. They finished hauling to their River Manie mill with their gasoline tractor on April 5. With the gasoline tractor in operation this year they were able to run their mill all winter without shutting down.

The Gloucester Lumber and Trading Co., Limited, Bathurst, N.B., have recently made additions to their sawmill which will increase the capacity to over 70,000 ft. per day. A new Waterous 36 in. Opening Carriage was installed as well as a Slab Resaw made by the McLennan Foundry and Machine Works Limited, of Campbellton, N.B.

An interesting indication of the high price of wood goods in Great Britain is afforded by the fact that a Toronto importer of cotton goods from Manchester has received notice that in future he will be charged 11s. 6d. for each box. Formerly these boxes, which are about 3 ft. 6 in. square and made of a good grade of lumber, were furnished free by the exporters in Manchester.

Mills in the State of Washington have been asked to bid on furnishing 8 million feet of lumber of miscellaneous sizes for the Panama Canal Commission. The enquiry also includes 3,375,000 feet of rough fir lumber and flooring for the Phillipine Islands, to be delivered on Puget Sound, and 250,000 cedar ties for the Alaska Engineering Commission, to be delivered in Alaska.

A deputation of the Montreal Builders' Exchange recently inspected the Forests Products Laboratories, University Street, Montreal. They were particularly interested in the testing of lumber for strength and in the experimental plant for creosoting lumber. This visit and the lecture before the Chambre de Commerce are indications of a wider public appreciation of the work of the laboratories.

A report from Ogdensburg, N. Y., states that on account of the shortage of print paper and the great demand for the product from which it is made, many more cords of pulpwood will be handled at the Ogdensburg terminal this summer than ever before. Preparations are being made to take care of additional shipments by boat from Quebec ports and for the unloading of the vessels at the terminal west of the city.

The report of the West Coast Lumbermen's Association, Seattle, Wash., for the week ending April 15th, 1916, shows that shipments exceeded cut by 3,787,000 feet B. M., or 11.56 per cent.; orders exceeded cut by 2,762,000 feet B. M. or 9.13 per cent.; shipments exceeded orders by 1,025,000 feet B. M. or 3.13 per cent. These figures are compiled from reports received by 67 mills with a six day capacity of 44,630,000 feet B. M.

The Southwest Boom Company, operating on the southwest branch of the Miramichi River, N. B., recently applied to the Provincial Legislature for permission to increase their tolls for rafting from 55c to 65c per thousand feet. There was a spirited debate upon the application when the bill came up in committee, but it was finally agreed to by the committee without amendment and was expected to be passed by the Legislature.

Mr. C. D. McNabb, manager of the Baker Lumber Company, at Waldo, B. C., reports that his company has taken out a very large cut of logs, sufficient to keep the mill running during the whole of the 1916 season. One logging camp is being operated at present and a second will be opened early in the summer. Orders are coming in plentifully from the Prairie Provinces and the company's planing mill is running steadily on material to fill these orders.

The first of several auxiliary powered schooners constructed for Chas. R. McCormick & Company, has been launched at Portland, Ore., for the lumber carrying trade. This is said to be the largest vessel on the Pacific Coast and the largest single decker under the American flag. The length of the schooner is 290 feet and the beam 44 feet. She will have five masts. Two engines of 320 h. p. each will drive her twin screws. She will have a capacity for carrying 2,000,000 feet of lumber.

The Saw is King in the World of Tools

Do you know how a saw is made, or why it cuts? Have you ever given it any thought? Being so universally and extensively used for many years, the saw has become such a well known object that its very familiarity seems to have dulled the sense of its true value and importance.

As a matter of fact, the saw has ever been man's greatest helper in the march of civilization, his most powerful and efficient assistant in the making of progress, in providing comfort and conveniences. It is the agency by which the scope of achievement has been immeasurably widened, permitting the accomplishment of greater and more difficult tasks with a corresponding lessening of human effort and toil. It is king in the world of tools. The results of its work are seen on every hand, wherever you may go. Think of what the conditions would have been without the aid of the saw, and only then, will you begin to realize some degree of its real importance and the wonderful part it has played in the world's up-building.

Though a hand-saw consists of but few parts, and its making appears to be a simple matter, yet this is far from the actual fact. A full understanding and appreciation of the work involved in its manufacture can be gained only by a personal trip through the works, where, step by step, in gradual development from crude, raw material, changed and refined in furnaces, transformed under monster rolls, shaped and formed by expert mechanics of long experience, aided by many machines, there finally emerges a beautifully finished, efficient article.

To furnish a proper conception of the true value of the saw, the principal operations are explained at length in a booklet entitled "How a Disston Handsaw is Made," and in a recent production, a finely printed twelve page pamphlet, on "Why a Saw Cuts," this particular subject is specially illustrated and described, demonstrating that the cutting action of a saw is based on scientific principles, bringing out new and astounding facts which few ever before realized.

Both the above publications, well worth reading, will be sent free, on request, by Henry Disston & Sons, Incorporated, Keystone Saw, Tool & File Works, Philadelphia, Pa.

Arkansas Soft Pine Beautifully Described

The Arkansas Soft Pine Bureau, Little Rock, Ark., have issued a unique and very attractive home-builders book entitled "Not a House, but a Home," regarding their product. In addition to being an attractive example of the printers' art, the book contains many practical suggestions and formulae for securing fine finishes of Arkansas soft pine. An extensive section of the book is devoted to a number of designs for bungalows and houses which have been prepared by architects specially commissioned by the Bureau. This work represents a cost of well over a thousand dollars, but is sure to be money well spent as the book will unquestionably convince many readers of the advantages to be obtained by the use of Arkansas soft pine. The cover of the book is a very fine example of color work, representing an old Colonial house, set in an attractive landscape. The printing of the cover is done in several colors.

Ontario

Alex. Kippen, sash and door monufacturer, Perth, Ont., has been succeded by P. W. Clement.

The Pembroke Lumber Company Ltd., Pembroke Ont., expect to commence operations at their mill about May 10th.

H. H. Green is constructing a small sawmill at Fort Frances, Ont., which will be in operation during the coming summer.

The Colonial Lumber Company Ltd., Pembroke, Ont., expected to start their mill about May 1st and to operate day and night.

The Petawawa Lumber Company Ltd., Pembroke, Ont., expected to start their mill about May 1st and to operate day and night.

The Keewatin Lumber Company, Kenora, Ont., started operations for the present season on April 17th with a large stock of logs on hand. The company expect to operate steadily throughout the season.

The Rainy River Company have sold their boom on the American side, about four miles up the river from Rainy River to the E. A. Engler Lumber Company of Baudette, Minn., who will operate it in future.

G. A. Oldrieve is moving his sawmill from Wallacetown, Ont., to St. Thomas, Ont., as the timber in the former district has become exhausted. The mill was erected nearly 60 years ago and is the oldest sawmill in Elgin County.

Reeve Alfred Tier's planing mill at Fenelon Falls, Ont., was destroyed by fire on April 18th. There was no insurance. Since the outbreak of the war this factory has been continually working on extensive contracts for ammunition boxes.

Hodgson Bros. Chemical Company Ltd., has been incorporated with head office at Lindsay, Ont., and capital stock of $20,000 to carry on business as manufacturers of lumber, pulpwood and chemicals. Those interested are T. Hodgson, H. Lowry, I. Hartt and others.

The Mattagami Pulp & Paper Co. Ltd., Traders Bank Bldg., Toronto, have given the contract for the construction of their dam, power house and railway, at Smooth Rock Falls, Ont., to Morrow & Beatty Ltd., 415½ George Street, Peterboro, Ont. The contract for the mill building will probably be awarded shortly.

The Canada Box Board Company Ltd., have been incorporated with head office at Toronto and capital stock of $100,000 to carry on business as manufacturers of and dealers in paper and pulp, strawboard, wood, etc. Those interested are G. MacBeth, G. R. Sproat, F. M. McDowell, C. H. Kemp, and R. Sheppard, all of Toronto.

The Wilson Lumber Company, 1 Spadina Avenue, Toronto, who operate extensively in southern hardwoods, have recently added to their holdings by the purchase of a block of standing timber situated at Finney, Virginia. The timber consists chiefly of oak and poplar, and amounts to about 6,000,000 feet. They are putting in a circular mill to saw it out.

The Peterboro Lumber Company opened their sawmills at Burnham Point, Ont., for the present season on April 17th. They will give employment to between 90 and 100 men and are looking forward to a busy season. They are having good luck with their drives and count upon a continual supply of logs. The mill has been thoroughly overhauled and its equipment improved.

The Crowley Mfg. Company Ltd., have been granted letters patent with head office at Toronto, Ont., and capital stock of $100,000 to carry on business as manufacturers of and dealers in all kinds of wood products, lumber, furniture, wood novelties and a general woodworking business. Those interested are J. F. Coughlin, T. W. Pinnell, A. W. Gilmour, F. P. O'Hearn and J. L. Waggoner, all of Toronto.

Eastern Canada

J. P. Vincent, lumberman, Montreal, P. Q., has been registered.

Wm. M. Sullivan, Nelson, N.B., will build a new sawmill this summer. The plant will have a capacity of about 100,000 feet per day.

The Ha Ha Bay Sulphite Company Ltd., Chicoutimi, P. Q., has obtained a charter.

Isidore St. Onge, St. Edouard de Lotbiniere, P. Q., recently lost his sawmill by fire. The amount of the loss and insurance has not yet been stated.

P. H. Renaud, Agnes, P. Q., will build a new mill at Cookshire, P. Q., to prepare the large quantities of pulpwood which he will cut on his Emberton limits.

The Edward Partington Pulp & Paper Company, St. John, N. B., will erect a new mill this summer. They have not yet decided definitely as to the equipment of the mill, but it is expected that it will include a band mill.

Price Bros. & Co. Ltd., Kenogomi & 56 St. Peter Street, Quebec, P. Q., are contemplating an extension to their lumber mills at a cost of $200,000. Tenders will be called about June 1st. The building will probably be of concrete construction.

J. R. Walker & Company, 35 Common Street, Montreal, P.Q., will rebuild their paper mill at Sault au Recollet, P. Q., which was destroyed by fire last October. Work is about to start and will be done by the owners. The machinery is being purchased in the United States.

The Rosemont Lumber Company Ltd., have secured letters patent to carry on business in the province of Quebec as dealers in lumber, timber and other forest products, with head office at Montreal, P. Q., and capital stock of $15,000. Those interested are A. Sarrasin, E. Sarrasin, and J. A. Laferte, all of Montreal.

The General Lumber Company Ltd., has been incorporated with head

office at Sherbrooke, P. Q., and capital stock of $49,000 to carry on business as manufacturers of lumber, logs, etc., and to operate lumber mills. Those interested are J. D. Bush, R. H. Bartlett, W. R. Lacey, C. K. Bartlett, and T. J. Harrison, all of Sherbrooke, P. Q.

The Laurentide Sand & Gravel Limited have secured letters patent, with power among other things, to carry on business as manufacturers of timber, lumber, logs, pulp wood or any articles made of wood. The capital stock of the company is $49,500 and the head office is at Quebec, P. Q. Those interested are S. N. Parent, O. Lefebvre, of Montreal, and P. A. Galarneou of Quebec.

J. & A. Culligan, Benjamin River, N. B., advise us that they have purchased the property of the Prescott Lumber Company at that point. The purchase includes about 90 square miles of timber land, together with the stock of logs cut during the past winter, the freehold to the land, mills, buildings and movable property. They are making no changes to the equipment this spring, but intend, during next fall, to remodel the mill and extend the boomage. They expect to cut betwee 4 and 5 million feet annually from this property.

Western Canada

F. T. McDougall, lumberman, Nokomis, Sask., has been succeeded by the Dutton Wall Lumber Co. Ltd.

The Ladder Lake Lumber Company, Big River, Sask., expect to operate their mill day and night during the present season.

J. P. Carnduff, Napinka, Man., recently suffered a loss of about $6,000 by fire at his lumber yard. The loss is practically covered by insurance.

Thos. Leslie & Wm. Gardiner have purchased the stock of the Eburne Sawmills Lumber yards at Steveston, B. C., and have organized the Leslie Lumber Company.

The Elkhorn Trading Co., Elkhorn, Man., has been incorporated with capital stock of $45,000, to carry on business as manufacturers of sash and doors and to sell shingles.

The Prince Albert Lumber Company, Prince Albert, Sask., expect to be operating at full capacity early in May. They are looking for one of the busiest seasons they have ever had.

The B. C. Sulphite Fibre Company, Standard Bank Bldg., Vancouver, B. C., recently lost their shipping shed and drying kiln at Mill Creek, B. C. by fire. The amount of the loss was about $40,000, which is covered by insurance.

The Coquitlam Lumber Company at Como Lake, B. C., who suspended operations three years ago, have sold their mill and timber to Messrs. J. C. Wilson and G. H. Sterriker of Royal Oak, B. C. The mill has a capacity of 20,000 feet per day.

The Union Cedar Mills Ltd., have been incorporated with head office at Vancouver, B.C., and capital stock of $10,000 to carry on business as lumber and timber merchants, sawmill proprietors, and dealers in timber, lumber, shingles and wood of all kinds, etc.

The City Box Company Ltd., Winnipeg, Man., have been incorporated with capital stock of $5,000 to carry on business as manufacturers, buyers and sellers of all kinds of boxes, etc. The incorporators include W. Lane, A. Charette, M. Bryer, F. Parks and A. Monroe, all of Winnipeg.

The Brunette Saw Mills Company Ltd., New Westminster, B. C., recently lost their dry kiln by fire, the loss being estimated at over $10,000. The kiln was worth $5,000 and it contained 1,500,000 shingles. The storage sheds between the kiln and the tracks and platform were also practically destroyed.

The Direct Manufacturing Company Ltd., has been incorporated with head office at Vancouver, B. C. and capital stock of $25,000 to carry on the business of manufacturers and dealers in lumber of all kinds, including wood pulp paper, refuse from mills and cutting and getting out logs and timber.

Sealed tenders are being received by the Minister of Lands for B. C. until May 17, 1916, for the purchase of License X586, to cut 1,616,190 feet of Douglas fir, cedar and hemlock on an area adjoining lot 779, Forbes Bay, New Westminster District. Two years will be allowed for the removal of the timber.

Sealed tenders are being received by the Minister of Lands for B. C. until May 17, 1916, for the purchase of License X590, to cut 4,959,600 feet of yellow pine, Douglas fir, and spruce on an area adjoining Sub-lot 2, of Lot 2711, Okanagan Lake, Similkameen District. Two years will be allowed for the removal of the timber.

Sealed tenders are being received by the Minister of Lands for B. C. until May 17th, 1916, for the purchase of License X601, to cut 1,090,000 feet of cedar, hemlock, and balsam, and 360 cedar poles on an area adjoining lot 808, Drury Inlet Range 1, Coast District. Two years will be allowed for the removal of the timber.

M. M. Wall of the Buffalo Hardwood Lumber Company, Buffalo, N. Y., reports that he and a group of Buffalo business men who recently purchased three good tracts of timber in Lillooet, Yale and Cariboo districts, B. C., are contemplating the erection of a mill. They are now actively examining their B. C. timber with a view to starting an operation there soon.

J. Hanbury Company's dry kiln, at Vancouver, B. C. was recently damaged by fire to the extent of several hundred dollars. The flames were confined to the dry kiln, but it is estimated that between 100,000 and 150,000 shingles were also burnt. The loss was covered by insurance. The operation of the mill was not interfered with by the fire.

Among the recent victims of the submarine warfare was a tramp steamer which sailed from Halifax, and was carrying large quantities of Canadian ground wood and sulphite pulp. To replace a portion of this, other pulp will be shipped to England.

According to reports prepared by the Crown Lands Department of Nova Scotia, forest fires during 1915 burnt over a total of approximately 13,000 acres. On a considerable portion of this area no merchantable timber was destroyed.

China's Import of Softwood Lumber

Imports of softwood lumber into China are extensive and promise to increase rapidly. Unfortunately, Canada's share in this trade is practically nil. Figures for three years are as follows:—

	1912 Square feet	1913 Square feet	1914 Square feet
Total imports of softwood timber ..	78,912,408	161,375,117	199,703,533

In addition to the above recorded imports of lumber, which consisted of heavy timber, beams, planks, scantling and boards, it is now possible from recent returns received, to give the figures of railway sleepers furnished to China by other countries within recent years.

1912	842,529 pieces, valued at taels	721,068
1913	1,539,836 pieces, valued at taels	1,447,414
1914	2,933,897 pieces, valued at taels	2,998,300

Countries of Origin

Classification—	1912 Pieces	1913 Pieces	1914 Pieces
Japan	812,574	1,444,540	2,583,864
United States	3,500	14,621	190,559
Russia	862	25,372	5,733
All other countries	25,593	55,303	153,741
Total	842,529	1,539,836	2,933,897

From this it will be seen that the comparatively cheap Japanese wood is mostly drawn upon to furnish ties for Chinese railways. Comparing also the figures of cost with the quantities furnished it will be observed that this represents about tael 1 per piece. This would be approximately 60 to 67½ cents Canadian currency per piece in the different years.

Paper and Cardboard

The consumption of paper in China is very great. This country has been manufacturing paper for many hundreds of years, but the mills only produce the classes of paper which have been peculiar to the country for many generations. As yet they have not established paper mills having modern equipment, nor have they produced paper suitable for the present-day requirements of newspapers and books.

The figures of imports for three years follow, but these do not represent the limits of the trade. Many inquiries have been made in respect to paper during the year, but unfortunately possible orders could not be executed.

	1912	1913	1914
Total imports of paper ... ... Tls.	4,351,713	7,212,982	6,525,268

The increase of newspapers throughout the country has been phenomenal within the past few years, and now every town of much importance has one or more newspapers.

New Method of Creosoting Douglas Fir

At a meeting of the Forest Club, held at Vancouver, B. C., recently, Mr. O. P. M. Goss, of Seattle, Wash., described an important new method of creosoting Douglas fir, by means of which the timber is preserved without any loss of strength. It is believed that this process will result in a much increased demand for Douglas fir as a bridge material, also for ties, wharf construction, etc. Mr. Goss, who is consulting engineer for the West Coast Lumbermen's Association, Seattle, Wash., spoke extensively also of the work done by the Association in the way of developing the coast lumber trade. Formerly Mr. Goss was engaged in the timber testing laboratories of the United States Forest Service, and is a recognized authority on this subject. The creosote is injected into the timber, under the new system, at a low temperature and under a low vacuum. This is a slower process than the old one, but Mr. Goss states that the wood retains 99.7 per cent. of its original strength. In some of the individual tests the creosoted timber was stronger than the uncreosoted. In no case had it less than 95 per cent. of the strength of the original timber.

Washington Red Cedar

An attractive booklet entitled "Washington Red Cedar—America's Overcoat Lumber" has been published by the West Coast Lumber Manufacturers' Association of Tacoma, Wash. The booklet contains an interesting discussion of red cedar and its various uses, laying particular stress on the fact that it is one of the longest lived timbers known.

A new issue of the "Consumers' Register" of the National Hardwood Lumber Association has just been published. This register contains details of the lumber requirements per annum of approximately 500 responsible factory consumers of hardwoods in the United States and Canada; freshly collected, revised and tabulated, and representing a total yearly movement of over 1 billion feet of hardwood lumber.

John Kerr, a prominent contractor and lumber dealer of Petrolia, Ont., died recently, after a long illness, in his 74th year.

A Large Cypress Transaction

Announcement has been made at New Orleans, La., of the completion of one of the largest timber deals in recent Louisiana history, whereby the Lutcher & Moore Cypress Lumber Company, of Lutcher, La., acquires a large tract of virgin cypress timber, together with some cutover land, from the Ruddock-Orleans Cypress Company, of New Orleans. The price paid was $2,150,000, constituting what is said to be the highest price ever paid for standing timber in that state. The tract involved is situated in St. John the Baptist Parish and is described as one of the finest cypress tracts remaining in Louisiana.

The deal was handled by James D. Lacey & Co., of Chicago and New Orleans, and has been under negotiation for some time. The Lutcher & Moore company's directors decided upon the purchase during the early part of February.

The transfer does not involve the erection of a new plant, nor affect the present output of either of the companies. The purchasing company will manufacture the timber from its newly acquired tract at its big Lutcher plant, giving it a larger supply and correspondingly longer term of operation, while the Ruddock-Orleans company will log its huge New Orleans plant from other timber holdings. The latter company had begun logging operations in the tract, but will transfer its logging crews and outfit to other timber which it holds in St. John Parish.

British Columbia Western Larch

Timber Series Bulletin No. 16, entitled "British Columbia Western Larch," has been issued by the B. C. Forest Branch. Known variously as tamrack, red American larch, larch, Western tamarack and hackmatack, and much more durable than Eastern larch, the sterling qualities of this species are described in the bulletin for the information of lumber dealers and wood-users. The annual cut in British Columbia, of late years, has averaged sixty-two million feet board measure, the range of Western larch being between the Rockies and the Cascades, south of the main line of the C. P. R. Suitable for many uses, and in some unsurpassed, Western larch supplies material for dimension, poles, piles and posts, ties, framing, outside and interior finish, tanks, troughs, grain elevators, refrigerators, silo stock, wood-paving, telephone cross arms, fencing, etc. Copies will be mailed upon application to the Forest Branch, Victoria, B. C.

5000 Facts About Canada

The public will welcome the new issue for 1916 of "5,000 Facts About Canada," the popular and valuable cyclopedia of Canadian dates, compiled by Frank Yeigh of Toronto, the well-known writer and lecturer on the Dominion. No up-to-date and intelligent Canadian can afford to be without this "hardy annual," which is a revelation in concrete form of the wonderful growth of our country in a single year, despite war conditions; indeed, it circulates all over the world, and as such is a splendid advertisement. The chapter of "War Facts" is, by the way, both timely and illuminating. Fifty other chapters are devoted alphabetically to every phase of our national life, from Agriculture to the Yukon, while several sketch maps are of high value. Copies may be had from newsdealers or by sending 25c to the Canadian Facts Pub. Co., 588 Huron Street, Toronto, Canada.

California Redwood Described

"California Redwood" is the title of a splendidly gotten up booklet, describing this attractive wood, which has been issued by the Service Bureau of the California Redwood Association, San Francisco, Cal. The booklet is one of the finest that has ever come to our notice. It contains ten four-color reproductions, picturing redwood in its natural state, also a few colored illustrations giving an excellent conception of the appearance of redwood when finished in various colors. The illustrations and general press work of the booklet are very striking and will carry conviction to any reader who is at all interested in securing good results in wood. The booklet also contains directions for securing a number of fine and rare finishes on redwood.

Market for Douglas Fir in India

Lieut.-Col. Clarence Smith, secretary of the Montreal branch of the Patriotic Fund, states that it has been decided that the 224th Battalion, or the Forestry Battalion, will not be placed on the lists of the Patriotic Fund. As the men will cut lumber in England or Scotland, it is held they do not come under the same category as those who have volunteered for the front.

An initial dividend of 1½ per cent. on the common stocks has been declared by the directors of the Riordon Pulp and Paper Company—a significant indication of the revival in the pulp industry.

If It's a Tent

No matter how large or how small our facilities are equal to the emergency. Try us.

Smart-Woods Stable, Storage and Circus Marquee.

Smart-Woods Mosquito or Black Fly Proof Fronts.

Keeps tents free from flies, mosquitoes and other insects. End of tent may be left open even in the worst periods of the year and with careful attention this insect proof end will keep the inside habitable and a welcome place to sleep in. A necessity to every woodsman, lumberman or railroad contractor during the warm months. Write for quotations.

Jones Stokers Cut Your Coal Bill 99%

A saving of 99% in the coal bill of a pulp mill is the result of an installation of Jones Underfeed Stokers. They are used in conjunction with Dutch ovens for utilizing as fuel the mill's refuse. This is not a theoretical result but an actual reality which is taking place daily in the plant of the Minnesota and Ontario Power Company's mills.

Substantial savings can be made in your saw, planing or pulp mill.

Write us about your conditions and let us tell you of the economy that can be brought about by the installation of Jones Stokers.

Literature and full particulars gladly furnished upon request.

Dominion Timber Regulations

Licenses to cut timber on Dominion Lands in the Provinces of Manitoba, Saskatchewan, and Alberta, the Northwest Territories, within twenty miles on either side of the main line of the Canadian Pacific Railway in the Province of British Columbia, and in the tract of three and one-half million acres to be located by the Government in the Dominion in the Peace River district in the Province of British Columbia, lying east of the Rocky Mountains and adjoining the Province of Alberta, shall be disposed of by public auction at the office of the Dominion Timber Agent for the districts in which the berths are situated.

Before any parcel of timber is offered for sale it shall be surveyed by a duly qualified Dominion Land Surveyor into berths of an area not exceeding twenty-five square miles, and each of such berths shall then be thoroughly cruised by a duly qualified timber cruiser in the employ of the Dominion Government. The Minister shall then fix an upset price at which the berth shall be disposed of, and no berth shall be sold at less than the price so fixed.

Purchases to the amount of one thousand dollars or under shall be paid in cash at the time of sale. Purchases over one thousand dollars and not exceeding five thousand dollars shall be paid, one-half in cash at the time of sale, and a note or notes shall be given for the remaining half of the purchase price, payable in three months, with interest at the rate of five per cent. per annum. Purchases over five thousand dollars and not exceeding ten thousand dollars shall be paid one-third in cash at the time of sale, and notes shall be given for the remaining two-thirds of the purchase price, payable in three and six months, with interest at the rate of five per cent. per annum. Purchases exceeding ten thousand dollars shall be paid one-fourth in cash at time of sale, and notes shall be given for the remaining three-fourths of the purchase price, payable within three, six and nine months, with interest at the rate of five per cent. per annum. Notes shall be made payable at a bank in the city or town in which the sale is held or at a bank in the city of Ottawa. Cash payments must be made at the time of sale in legal tender or by an accepted cheque on a chartered bank, or by a draft issued by a chartered bank, payable to the order of the Deputy Minister of the Interior. If default is made in any payment required by this section the sale shall be forfeited and void.

The purchaser must also pay the cost or the estimated cost of the survey of the berth before a license is issued.

The licensee shall pay an annual ground rent of five dollars per square mile except for lands situated to the west of Yale, in the Province of British Columbia, in which case the yearly ground rent shall be five cents per acre.

The licensee shall pay the following dues on timber cut on his berth :—

Sawn lumber, 50 cents per thousand feet, board measure.

Railway ties, eight feet long, 1½ cents each.

Railway ties, nine feet long, 1¾ cents each.

Shingle bolts, 25 cents per cord.

And 5 per cent. on the sale of all other products of the berth.

Timber Permits

Yearly permits are granted to settlers, mine operators and others on application to the Dominion Timber Agents, from whom further information can be obtained.

W. W. Cory,

Deputy Minister.

Department of the Interior, Ottawa,
December 20th, 1912.

This Will Announce!

WE can make no more important announcement than to advise our readers that the **1916 Annual Number** of the "Canada Lumberman and Woodworker" will be published on May 15th.

The **1916 Annual Number** will be of exceptional interest because we are entering a new era of increasing consumption at home, and increased exportation of Canadian lumber and wood products.

The "Canada Lumberman and Woodworker" has proved its value to Canadian lumbermen and manufacturers of wood products by ably assisting them to improve their manufacturing efficiency and to increase their markets.

The "Canada Lumberman and Woodworker" has shown remarkable growth of circulation in recent years.

There is a tremendous buying power among the readers of this publication for any high grade product suitable for saw mills and lumber consuming factories. The excellent circulation of the paper among lumber dealers and factories, both at home and abroad, also makes it an excellent medium through which to reach lumber buyers.

The **Annual Number** of the "Canada Lumberman and Woodworker" is an established institution. Exceptional care has always been taken to select contributors with a specialized knowledge. This year's special contributors—over 25 in number—will furnish articles of real practical value for lumber dealers, factory superintendents and managers of saw mills.

There is business for you among the subscribers of the "Canada Lumberman and Woodworker," in Canada, the United States, Great Britain, France and other countries.

A page announcement in this **Annual Number** will appeal very directly to the buyers of your product. Let us have your order for a page.

Here's what we do for you!!

Our Traffic Engineers know from actual experience the Hauling Problems of every business. This knowledge is worth money to you—if you will use it. We maintain a staff of trained Traffic Engineers who will tackle your problems of Haulage and Delivery in a business-like way, and give you a report that will present in facts and figures the most economical method that you can adopt to get the most efficiency in the delivery end of your business.

NATIONAL Motor Trucks are made in four models — 1500 pounds, 2000 pounds, 4000 and 7000 pounds. Capacities that provide a truck for every line of business.

If you are as thorough in your investigation of the different makes of Trucks as we are in the construction of the NATIONAL you will own a NATIONAL Truck.

Conferring with us entails no obligation. Catalogue mailed upon request.

Conveyed More Than 700 ft. by Sturtevant Fans

Photograph shows part of a dust collecting and conveying system at the B. & M. R. R. Shops at North Billerica, Mass. At the right is the carpenter shop with collector on roof, and at left is the power house where storage bins and furnace feeders are installed. This system serves a large number of machines in the wood-working shops and a large number of Sturtevant Planing Mill Fans of different sizes handle the material.

The two great features of Sturtevant Planing Mill Fans are—(1) low power consumption, (2) dependability. In fact we have planing mill fans which have been running for thirty and thirty-five years, and the fans we make to-day are built with the same merit and with the same care as characterized our early product.

Send for catalogues and details.

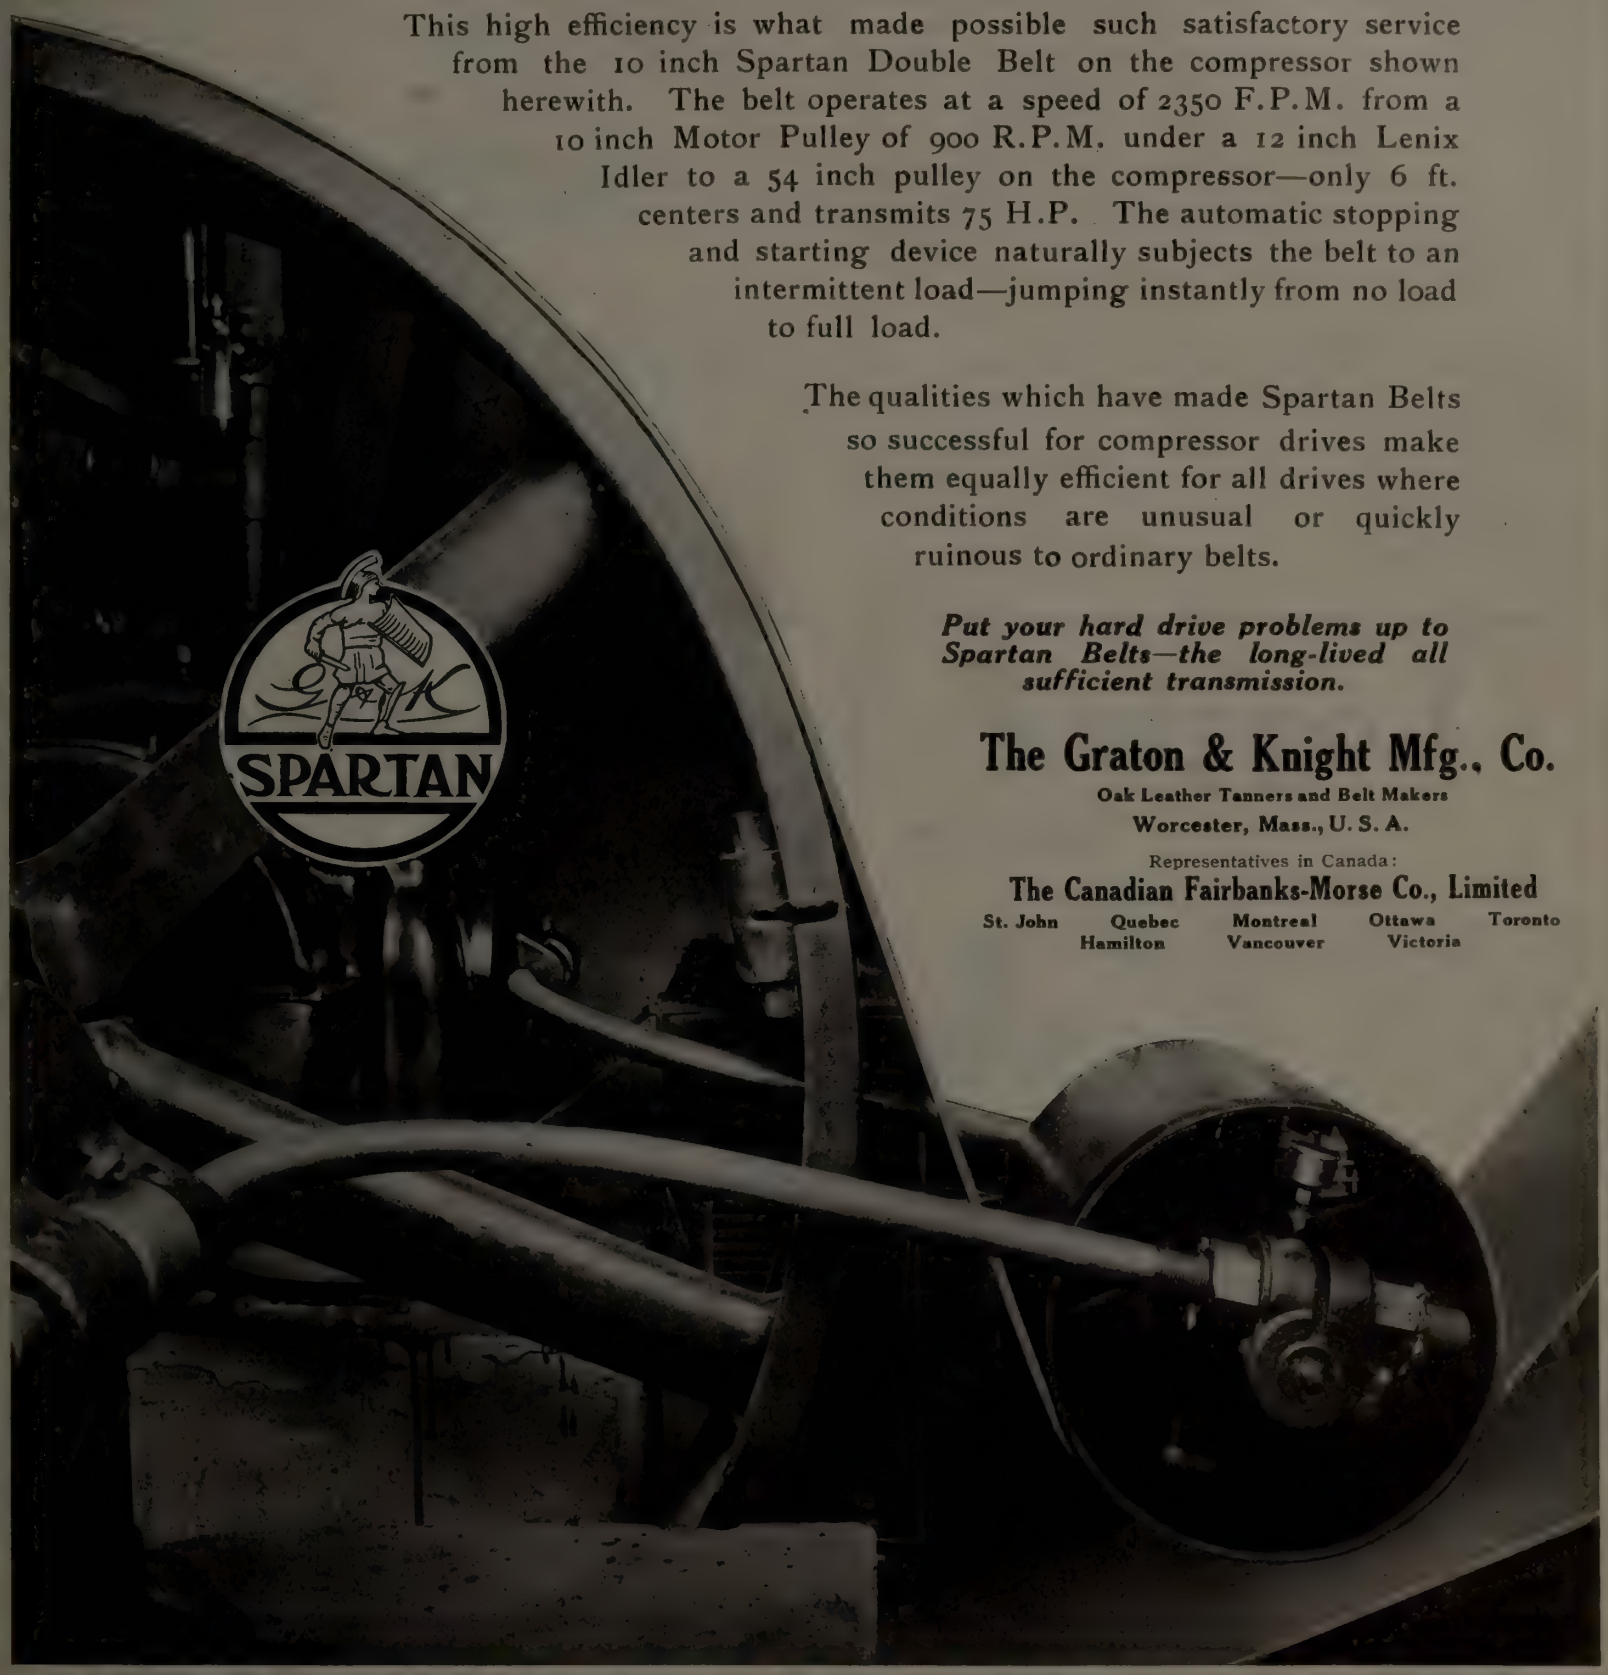
SPARTAN BELTS

for Compressors

STRENGTH, pliability, and power to resist abnormal physical conditions are the characteristic qualities which make Spartan Belts so highly efficient for compressor work.



This high efficiency is what made possible such satisfactory service from the 10 inch Spartan Double Belt on the compressor shown herewith. The belt operates at a speed of 2350 F.P.M. from a 10 inch Motor Pulley of 900 R.P.M. under a 12 inch Lenix Idler to a 54 inch pulley on the compressor—only 6 ft. centers and transmits 75 H.P. The automatic stopping and starting device naturally subjects the belt to an intermittent load—jumping instantly from no load to full load.

The qualities which have made Spartan Belts so successful for compressor drives make them equally efficient for all drives where conditions are unusual or quickly ruinous to ordinary belts.

Put your hard drive problems up to Spartan Belts—the long-lived all sufficient transmission.

Logging Locomotives
Made in Canada

Our fifty years' experience in the design and manufacture of logging locomotives is at your disposal. Many of the largest logging operators in Canada are using our "Canadian Made" locomotives.

Our logging models are as carefully designed and built as our 200 ton sizes—oil or coal burning.

MAY WE SEND YOU SPECIFICATIONS?

This engine is 13½ ins. x 18 ins. and weighs 35 tons.

LOGGING LOCOMOTIVES

The designs of our Logging locomotives are the result of wide experience, extending over a period of 80 years.

The material used in their construction is thoroughly tested and is the best of its kind.

All details are accurately finished to standard gauges and are absolutely interchangeable on all locomotives of the same class and size.

This cuts out long delays at critical times of the work, as parts liable to wear can be kept on hand or shipped promptly from our works.

"Wilson Bros." Hardwood Flooring

is the Flooring that is manufactured expressly to supply the demand for the best. It is made by modern machinery from carefully selected stock, and every precaution is taken throughout our entire system to make it fulfil the requirements in every particular. Write us for prices.

Wilson Bros., Limited - Collingwood, Ont.

When You Overhaul Your Mill

THERE are wet places in every saw and pulp mill where nothing but the highest class belting can "make good" It is for these wet places that we recommend what most mill-men swear by—our

"ACME WATERPROOF" BELT

This belt is especially made for a rough and trying service. It has less stretch than any other belt by 15 to 25 per cent.
When you are overhauling try a Goodhue "Acme Waterproof" belt. Other Goodhue belts are "Extra" and "Standard."

Prices and Particulars on Request.

LEVIATHAN OR ANACONDA

LEVIATHAN and ANACONDA have been sold on a "make good" basis for over thirty years. If they hadn't made good we would have been out of business long ago. The fact that our business is progressing rapidly is ample proof of the merit of this belting.

With every belt we guarantee full value in service, dollar for dollar, horsepower for horsepower, and just as we have figured our tables of horsepower for the best results, just so in making the above statement, we not only expect to give equal service, but BETTER SERVICE, AND MORE ECONOMICALLY.

A Leviathan Main Drive in constant service for four years at the plant of the Riviere du Loup Pulp Co.—24 in x 6 ply. No cost of up-keep; the belt has never been touched since the day it was installed.

Why not give us a trial order and let LEVIATHAN or ANACONDA prove itself?

ATKINS
BAND and RE-SAWS

We have achieved an enviable reputation for supplying SAWS which stand up to their work longer, with less re-fitting than any other SAWS in the world. If there is any doubt in your mind, we stand ready to prove it to you.

A Perfect Saw for Every Purpose

Send for our 248 page book on Saws. The most valuable and interesting Saw book ever published. Tells you just what you want to know about SAWS, MACHINE KNIVES and SAW FITTING TOOLS.

Put Yourself in His Place

Here is a man at a bench, filing.

The file is worn.

He makes three strokes where, with a sharp file, he need make but one.

It takes him three times as long to do the job.

When it is finished, he is not as well satisfied with it as he would have been if he had a proper file.

The foreman thinks the man is slow or lazy. The man's time sheet does not give him as good a record as the man who is working at the next bench with a sharp file. The man gets irritated. So does the foreman and the employer who pays the bills.

But, throw away that file the minute it reaches its "inefficient point" and what do you get?

The new file costs a few cents. The man does his work in one-third of the time. He is more satisfied with his job. The foreman is pleased with the man—and the employer has saved money on the time sheet.

See to it that the first condition of affairs described is not common in your factory. Instruct your foremen to educate their workmen to turn in files the moment they reach their "inefficient point." Your investment in new files will more than pay for itself.

Nicholson File Company
Port Hope (*Dealers Everywhere*) **Ontario**

This Plymouth Transmission Drive

has been in steady use for six years in a certain New Hampshire lumber mill. From each December to the following June or July it has been run night and day. There are 18 ropes. The sheaves are 11′ and 5′ 6″ diameter and their centers 72′ apart. The engine generates 700 H. P.

Plymouth Manila Transmission Rope gives service of this sort because it is made **correctly** from **fiber of superior quality.**

We also manufacture Plymouth Manila Rope for general lumbering use, Plymouth Manila Mill Carriage Rope and Plymouth Sisal Lathyarn—the most satisfactory and economical tie yarn on the market today.

Put your cordage problems up to us. We have specialized at this business since 1824.

FIRE BRICK

Differs in Quality and Variety

For instance, a certain quality or kind of brick that gives satisfaction when used in a Refuse Burner, may show up poorly if used in a Dutch Oven.

It all depends on getting the right kind and the right quality for your particular needs.

Just tell us what you want it for, and we'll send a firebrick that was made for that very purpose.

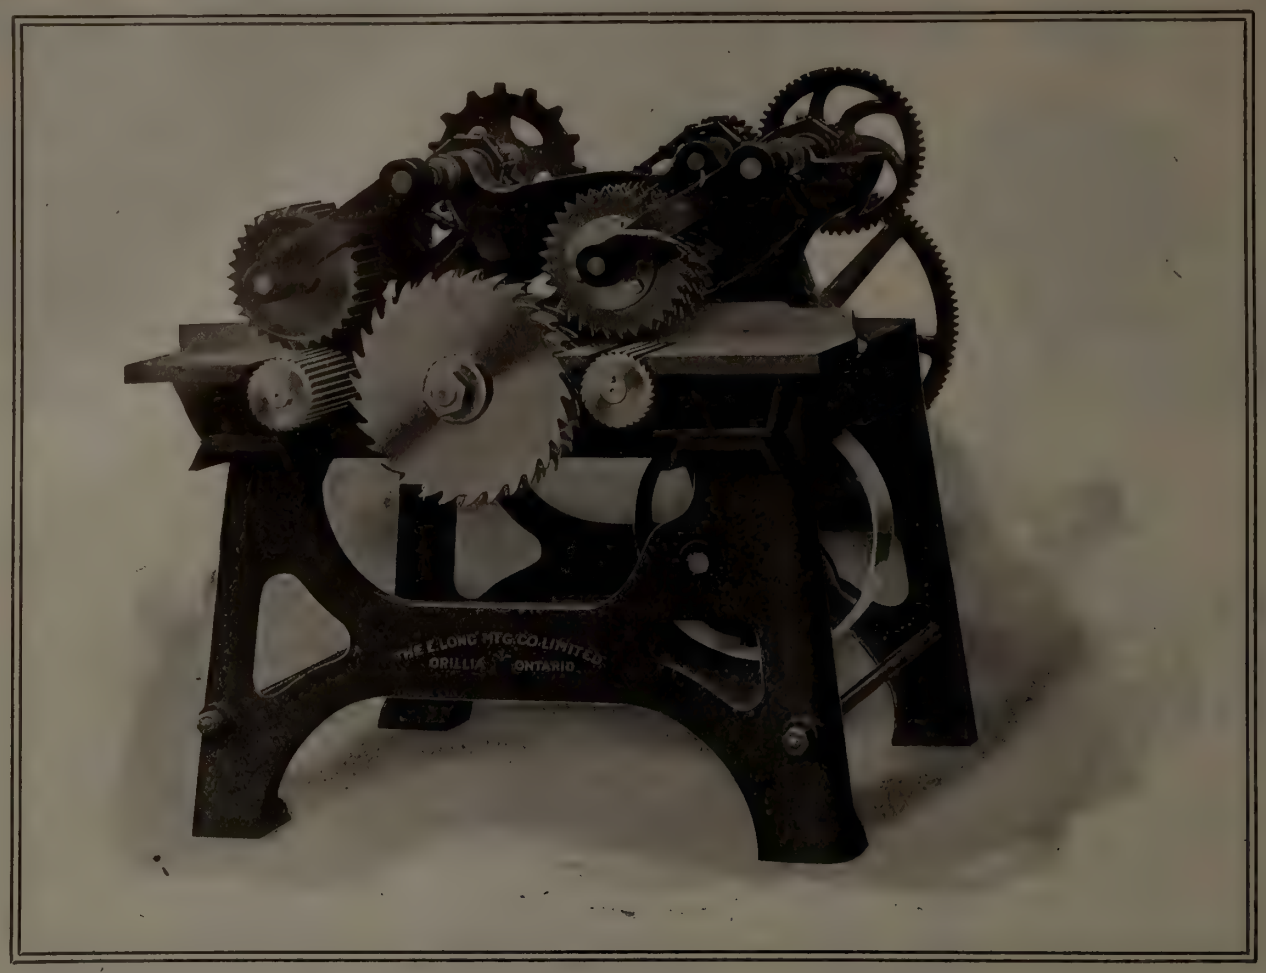
We Manufacture the Following Well Known Brands

"Elko," "Elk Steel," "St Marys," "Keystone" and "Rotex"

Write for a copy of our Catalog.

"Refractory Efficiency Engineering"

Elk Fire Brick Co. of Canada, Limited
HIGH GRADE FIRE BRICK and CLAY
Federal Life Bldg., Hamilton, Canada



This mark on your saw mill machinery is an indication that your lumber manufacturing equipment is the best and most economical money can buy.

No. 2 Bolter

This No. 2 Bolter is the ideal machine for the mill of medium production using a single band or circular. It will handle **all** the slabs from such a mill with ease.

The frame is of unit construction, the three saws are of 16 inches diameter adjustable for lath, pickets or slats and the feed rolls are power driven.

For a solid substantial machine of ample capacity you cannot beat our No. 2 Bolter.

Ask us for catalogue.

The E. Long Manufacturing Company, Limited

Orillia, - - - Ontario

A Steam Nigger for Medium Mills

One drawback of the ordinary Steam Nigger is the fact that it requires an expert to handle it. Only a slight skip on the part of the operator is sufficient to cause disastrous results.

Where the carriage is of medium weight, unless in the hands of an experienced man, the danger of wrecking the carriage is especially great.

The **Waterous Kendall Nigger** is practically *accident-proof.* While it possesses both the speed and power of the ordinary Steam Nigger, it is so designed that a green operator can do quick and effective work without endangering the carriage in any way.

WATEROUS KENDALL NIGGER

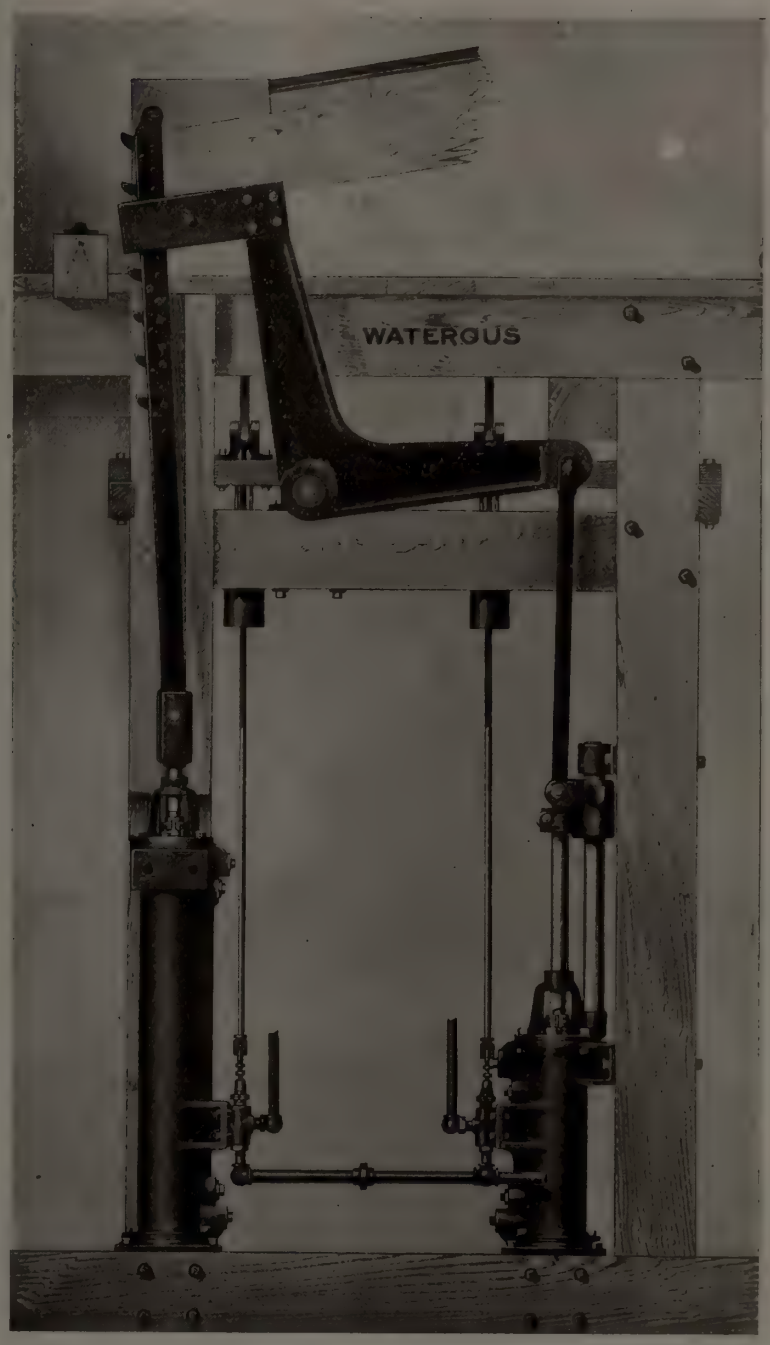
By attaching the Nigger Bar to *one* cylinder only, one motion of the operating lever turns the log and *a quite distinct and separate motion* is required to load it.

The stroke of the cylinder controlling the loading motion is made very short and thus further precludes the possibility of a serious mishap.

The **Kendall Nigger** is constructed to be powerful and rapid in action. The cylinders are 10 in. and 8 in. in diameter, pistons are steam cushioned at both ends of stroke, valves are adjustable to permit increase or decrease of operating speed without affecting the power of the machine.

Nigger Bar is of wrought iron, dogs are extra wide, top dog is winged, a steel roller is supplied. No Floor plate is necessary. All lever and crank connections are made short and direct, so that the machine gives instant response to the movements of the sawyer's lever.

A great many of these Niggers are already in use in mills, where speed and accuracy on the log deck are essential, but where a medium weight carriage is operated. If your conditions are similar the **Waterous Kendall Nigger** will give you unequalled satisfaction. ***Ask for details and descriptive catalogue No. 123.***



OUR LOG DECK EQUIPMENT INCLUDES:

Log Loaders	Oscillating Niggers
Kickers	Cant Trips
Flippers	Board Lifters
Stationary Niggers	Log Turners

"FROST KING" METAL

$5,000,000.00
worth of mixed metal sold annually.

Our thirty-five years experience in metal mixing enables us to place on the market a babbitt that we believe to be absolutely perfect. For high speed machinery and engine work it is without an equal. It is specially designed for saw-mills, planing mills, threshing engines, traction engines, pumps, rolling mills, pulp machinery, and all classes of stationary engines. It is a high grade metal made of the very best selected stock, and carefully compounded.

If your dealer does not stock FROST KING send us a money order for your requirements. Price **30c per lb.**, Fort William and East; West of Fort William **35c per lb.**, delivered nearest railway station; packed in 30 lb. and 60 lb. boxes.

For extra duty, such as over-hanging saws, our FAULTLESS BABBITT will stand where all other metals will fail. Price, Fort William and East, **40c per lb.**; West of Fort William, **45c**, delivered to your nearest railway station; packed in 30 lb. and 60 lb. boxes.

COSTS LESS PER DAY

AMPHIBIA BELTING

COSTS LESS PER DAY

Put Good Belting

on your

Good Machines

Your machines are expensive, and naturally you expect them to turn out the quality and quantity of work commensurate with their cost.

Then why harness them with belting which cannot begin to do them justice?

Use

"AMPHIBIA"

Planer Belting

and get the most work from your machines, in the quickest time, at the lowest cost per day of service.

Try a sample run of "AMPHIBIA" Planer and prove its merits.

"Leather like gold has no substitute."

FOR SALE: Machinery and Timber

The undersigned offer for sale, in large or small blocks all their remaining timber lands, mills and town property situated in the town of Parry Sound, Ont.

We have sold quite a number of timber parcels but still have some good bargains left in Townships of McDougall, Foley, McKellar, Monteith, Carling, Christie, Shawanaga, Burpee, McConkey, Mills, Allen, Secord, Falconbridge and Street.

Special bargains in the townships of Burpee, Falconbridge and Street for small mills.

We have the following Sawmill Machinery for sale:

1 8 ft. Double-cutting Telescope Band Mill, made by Waterous Engine Works.

1 3-block right hand steam feed carriage fitted with steam set works, made by Wm. Hamilton, Peterboro, with 10-in. steam feed cylinder.

1 Double cylinder steam nigger, right hand.

1 Log Loader for right hand mill.

1 8 ft. Double-cutting Telescope Band Mill, made by Waterous Engine Works.

1 10 in. Double-cylinder steam feed carriage, left hand, for cutting 24-ft. logs.

1 left-hand steam nigger.

1 Log-loader.

1 Endless chain jack ladder with two kickers complete for right and left hand mills.

2 Roger Gang Edgers for 8-in. cants and lumber.

1 Waterous double edger, 6 saws.

2 2-saw trimmers.

1 20-ft. Slash table.

1 16-ft. Revolving Slash Table.

1 Horizontal Slab Resaw with 5-ft. wheels, made by Diamond Iron Works.

1 70-ft. Transfer Chain for sorting lumber, with necessary levers, rolls and transfer chains to complete outfit.

1 Lath Mill with bolter.

2 Lath Trimming Saws.

FILING ROOM

1 Automatic Filing Machine for 12-in. D.C. band saws.

1 Automatic Grinding Machine for 8-in. S.C. band saws.

1 Hand Machine for cut-off saws.

1 Lap Grinder.

1 Set Band Saw Rollers and levelling blocks, with necessary swedges, a number of second-hand band, gang, edger and slash table saws.

POWER PLANT

2 Double Duplex, high pressure Water Pumps.

5 60-in. x 16-ft. Return Tubular Boilers, allowed 125 lbs. steam.

2 125 h.p. Water Wheels.

1 Upright Engine for sawdust conveyor.

1 10 h.p. Engine.

1 Mitts & Merrell Hog.

1 Wood Machine for 22-in. wood.

1 Edger for ripping dry lumber, installed.

1 Edger for ripping dry lumber, not installed.

1 30 h.p. Generator, 250 volt.

1 30 light arc generator.

There is also a large quantity of shafting, pulleys, hangers, belting, tram cars and turn-tables, particulars of which may be had on application.

All of the above open for inspection at Parry Sound.

The Parry Sound Lumber Co., Limited, 26 Ernest Ave. Toronto, Can.

ARKANSAS SOFT PINE
TRADE MARK

Do you require "A" Finishing Stock

for your interior trim trade—and do you experience any difficulty in securing it?

If so

ARKANSAS SOFT PINE

should command your immediate and close consideration.

The manufacturers of Arkansas Soft Pine—which is a Nationally Advertised, Trade Marked wood and therefore a product of standard excellence—can supply **immediately** an unsurpassed quality of "A" Finishing in every item of this classification as well as in Edge Grain flooring, ceiling, partition and drop or bevel siding.

Our finish makes perfect stained or enameled woodwork.

Our flooring makes mirror like, durable floors.

Our siding, being free from pitch, **holds** paint.

Our National Advertising, plus dependable grading, makes Arkansas Soft Pine easy to sell on the basis of specific use rather than on price

We can convince you, with one car load.

All stock bearing the Arkansas Soft Pine Trade Mark is manufactured and sold exclusively by the following companies:

Wisconsin & Arkansas Lumber Company, Malvern, Ark.
Arkansas Land & Lumber Company, Malvern, Ark.
Arkansas Lumber Company, Warren, Ark.
Cotton Belt Lumber Company, Bearden, Ark.
Crossett Lumber Company, Crossett, Ark.

Toronto

A Home Built of British Columbia Timber.

Are You Prepared to Supply the Inevitable Demands of Your Customers For This *Unsurpassed Canadian Product*?

British Columbia Douglas Fir

The Wood Which Ten Years Hence

Douglas Fir Tree.

Will Dominate the Canadian and American Lumber Markets

DOUGLAS FIR is the strongest wood in the world for its weight obtainable in commercial sizes and quantities.

It is unexcelled for the most exacting requirements of modern engineering practice, and the highest class of interior finish.

The combination of STRENGTH and LIGHTNESS which Douglas Fir possesses gives it a superiority shown by official tests here quoted:

Average Strength Values for Structural Timbers
Grade I. Tentative Grading Rules, U. S. Forest Service

GREEN

SPECIES.	Fiber Stress at Elastic Limit, lbs. per sq. in.	Modulus of Rupture, lbs. per sq. in.	Modulus of Elasticity, 1000 lbs. per sq. in.	Relative Strength Based on Modulus of Rupture, Douglas Fir, 100 p. c.
DOUGLAS FIR	4402	6919	1643	100.0
Longleaf Pine	3734	6140	1463	88.7
Loblolly Pine	3513	5898	1535	85.3
Shortleaf Pine	3318	5849	1525	84.5
Western Hemlock	3689	5615	1481	81.1
Tamarack	3151	5469	1276	79.0
Redwood	4031	4932	1097	71.3
Norway Pine	3082	4821	1373	69.6

Timbers of different species, in the above table, were graded by the same grading rule. Due to this fact, it is possible to get a fair comparison of the strength of each species.

To the Owner of Timber Lands

Far sighted owners of timber lands should take advantage of the times incident to the European wars, and prepare themselves for the day when the demand for timber is suddenly thrust upon them. This is certain to come at no distant day. Therefore cultivate a closer acquaintance with your holdings, and the best method of marketing them. Let us prepare the way for you. Remember, we not only report on the property, but assist in marketing the bond issue when necessary. Send for our booklet.

South Coast and Northern Lumber Co., Inc.

Saranac Lake, New York

Announcement

Murray & Gregory, Limited, have been established at St. John, N. B., since 1866, manufacturing Lumber principally for the British, West India and Home markets.

In connection with their business there, they have a Woodworking Factory and Glass Works and supply all wood and glass materials used in building.

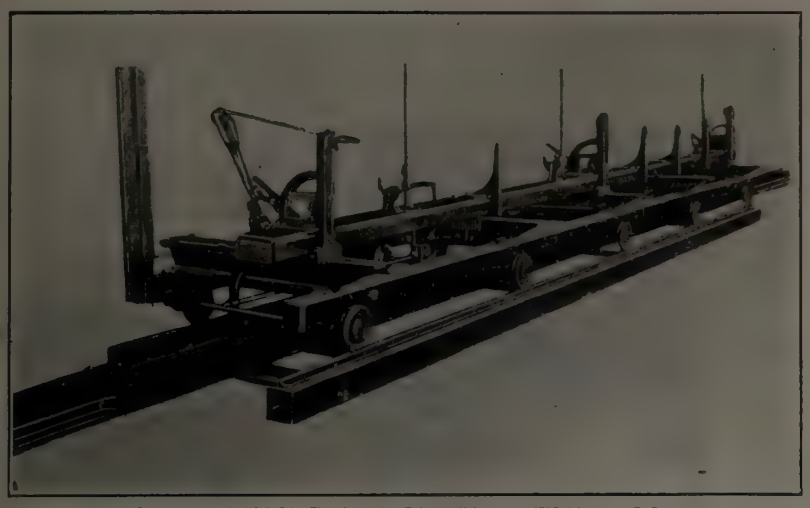
With the extension of the Chaudiere Branch of the Quebec Central Railway, during the past two years, into their Timber Limits in Quebec, they have built mills at St. Camille, Bellechasse Co., and Lake Frontier, Montmagny Co., where they are now manufacturing Spruce and Pine Lumber for the British and United States markets.

In Quebec, they are manufacturing and dealing in both Peeled and Rossed Pulpwood.

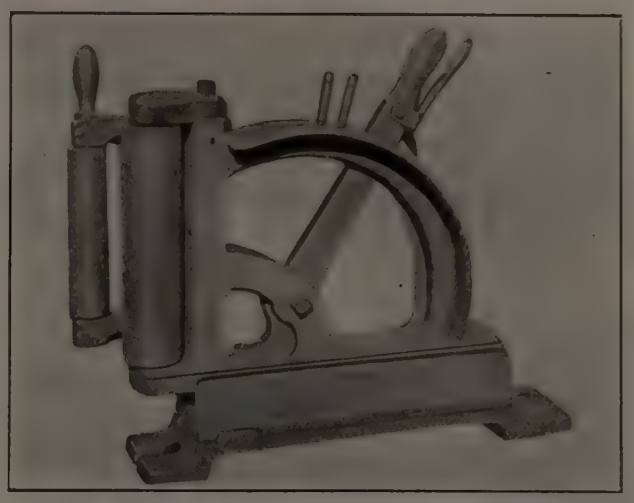
To individualize their Quebec products, they have adopted as their trade mark on Lumber, Logs and Pulpwood, a Trident which will stand always for "the best."

The Head Office of the Company is at St. John, N. B.
The Quebec Office at St. Camille, Bellechasse Co., P. Q.

The OXFORD Line
of Sawmill Machinery



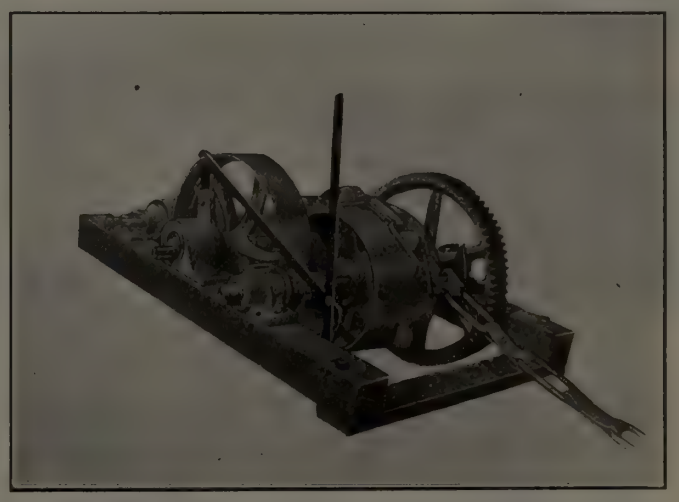
20 FOOT ORDINARY FRAME CARRIAGE, WITH 5 LOG SEATS, WITH 3 SLIDES—Built in many sizes to suit purchasers.



OXFORD BOARD AND DEAL GAUGE (RIGHT HAND)—We also make left hand for left hand carriages. Notice extra roll—when this is set to saw a board, to set for deal simply swing this roll back, so large roll comes in contact with deal, then with the lever you can set roller to saw any thickness in ¼-in. from 0 to 6 in. These gauges supplied on all our portable mills.

OXFORD TRAM ROAD ENGINE—Runs on sawn wood rail 4 x 4 Hardwood or 4 x 6 Softwood. In winter, put a set of creepers on wheels, these are furnished. Steamer is under the control of driver, gasoline has to be stopped to reverse. In steamer the reversing lever will almost instantly stop or reverse motion of car, no troublesome gearing. Customer who used both says: "Cost of fuel for the gasoline was over four times as much as for steamer."

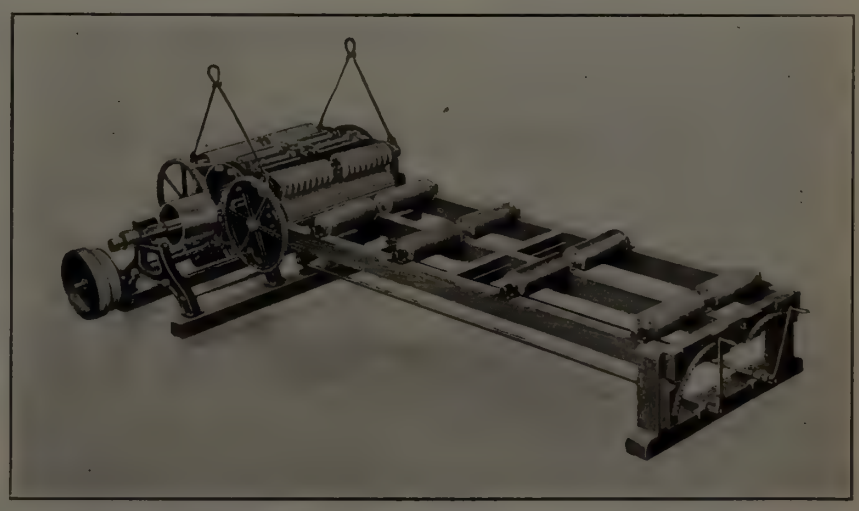
Machine weighs about eight tons. A machine of this kind has hauled 20 thousand sup. feet of lumber up 5 per cent. grade. 20 M. feet of lumber with eight trolleys would weigh about 35 tons.



ENDLESS HAUL UP; geared and friction with 30 inch by 4 inch face gear, 6 inch by 4 inch face pinion, 30 inch by 6 inch face cast iron friction, 6 inch leatherboard friction, pulley sprocket 21 inch by 14 inch with forged lugs, eccentric, box and iron lever, for use with our forged chain with steel or cast iron carriers.

Oxford New Model Horizontal Engine

Advantages:—Main bearing sets nearer vertical which brings adjustment now in line with the wear. Main bearings adjusted with taper key, and screws can be adjusted while engine is running. Balanced crank which permits of high speed without vibration. Main pulley has split hub, rim of wheel sits over bearing about 4 inches which brings strain of belt direct on bearing. Shaft and bearings are heavy enough to put trimmer pulley on with large pulley, thus getting trimmer belt out of fireman's way.



HEAVY DOUBLE EDGER—This Edger will edge for a gang on one side and rotary on the other, cutting any different thickness of stock on either side, and going through Edger at same time. Built with variable friction feed if required. Also resawing attachment.

TRADE MARK

Order a sample dozen, you will order more when you try them.

Campbell's XXX Single and Double Bit Axes

are made from the best material by skilled workmen who are paid an extra price for the best goods that can be produced.

Every axe is properly heated in forging, carefully tempered by an expert, ground true and thin to a keen edge, which it will retain.

This axe has been on the market for twelve years with increasing demand each season.

Lumbermen appreciate axes, which they can rely upon to stand up under all conditions.

Write us for prices and sample dozen. We know they will please you.

Campbell's XXX Hammer Poll Axe

Something New

Lumbermen find it difficult to get axes, which wil stand hard usage in driving saw wedges.

Our invention we guarantee for driving wedges, bolts, etc.

The poll is made from best cast steel V-shaped welded into poll of axe and cannot come apart or flatten out.

It is made to balance and will chop easier than light poll axes.

After using Campbell's Hammer Poll Axe you will discard striking hammers, mall or old style axes.

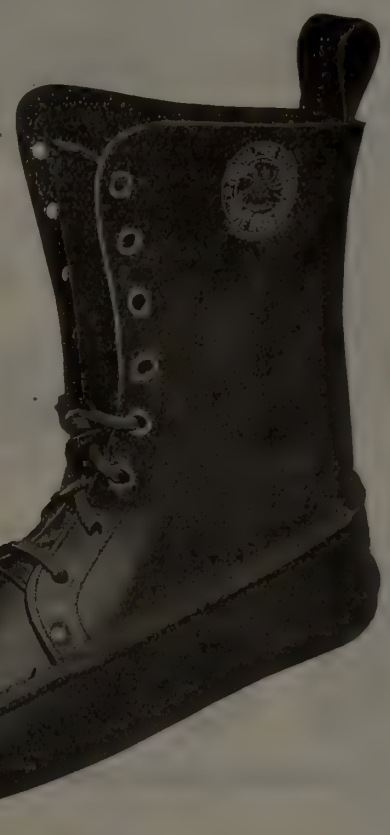
"Moose Head Brand" Oil Tanned Shoe Packs and Moccasins

No. 20

No. 20—Men's Skowhegan "Moose Head Brand" Waterproof Shoe Pack is made of the best skowhegan waterproof leather with heavy pliable bottoms. This is one of our leaders, and never fails to give satisfaction, also made by our Draw String non-rip non-leak process.

In every line of endeavour there is always a leader, and many imitators. Palmer's "Moose Head Brand" Waterproof Shoe Packs, Larrigans, Sporting Boots, etc., are not an exception. For forty years we have been making the famous "Moose Head Brand" Oil Tanned Footwear. In fact we are the first firm to manufacture this class of footwear in Canada. Our famous Skowhegan Waterproof leather from which these goods are made is tanned by our celebrated waterproof process in our tannery, from the best heavy packer steer hides procurable.



No. 101

No. 101—Palmer's "Moose Head Brand" Summer Pack, for men who work. These packs are also made three and eight eyelets high. Used in and around the mill, woods, on the farm, and any place where hard serviceable wear is required. Made on right and left comfortable easy fitting lasts. Light but strong and durable. Made from oil tanned skowhegan waterproof leather with full waterproofed sole leather sole and heel and solid insole.

No. 36

No. 36—Men's Skowhegan "Moose Head Brand" 10 in. Leg, Waterproof Shoe Pack, made by our Draw String non-rip non-leak process. This 10 in. Pack is one of the best sellers that we manufacture, particularly when made by the Draw String process.

Insist on getting Palmer's Oil Tans. Prices and catalogue will be sent on request.

Original "Dunbar" Machines

First in Quality, Workmanship, Performance

We are the original and the only makers of "Dunbar" Shingle Machines, Lath Machines, Clapboard Machines, Steam and Gasoline Logging Engines. Each is the best for its particular work. Are you using the best? Send for catalogues of any or all of these machines.

Lath Machine

From our many years of experience we evolved this "Dunbar" Original Lath Machine. Every improvement that could be suggested, every time-tested idea for the betterment of product and for greater speed, has been incorporated in this machine. We believe it has no equal, and there are a great number of mill men throughout Canada who share this belief with us. Carefully constructed of high grade materials and designed to work steadily under the hardest conditions.

Steam and Gasoline Logging Engines

Conditions in Canada necessitate an engine that will stand any amount of strain and hard work in the lumber industry. With this idea in mind we have brought out the "Dunbar" engines perhaps a little stronger than is really needed. They do their work easily and willingly, and stand a great amount of hard usage. Built entirely in Canada for the Canadian lumber trade.

Clapboard Machine

You will need no excuse for the quality of your product if you use the original "Dunbar" Clapboard Machine. Expert in every detail. This machine will give you the very best service under most trying conditions. It will turn out work without delays. It will need practically no repairs and will increase your output. We cannot recommend it too highly because it is giving this very service to lumbermen in all parts of this country.

Province of Quebec

TIMBER LANDS

Timber Lands

License or permission to cut timber on public lands in this Province is acquired at public auction, after due notice has been given, subject to a yearly ground rent of $5 per square mile, and is renewable annually, povided the licensee shall have complied with the regulations.

The timber cut in virtue of such license is subject to a tariff of dues fixed by order in council.

The present rate of ground rent and tariff dues shall not be increased until the 1st of September, 1920.

Licensees are fobidden to cut on Crown lands trees less than a fixed diameter.

The Regulations also provide that all timber cut on Crown lands must be manufactured in Canada.

In the event of a licensee wishing to transfer his rights, he is at liberty to do so under certain conditions, namely, the paying of a fee of $4 per square mile.

There are at present time about 75,000 square miles of forest lands under license and over 150,000 miles in the possession of the Crown.

WATER POWERS

Water Powers

To obtain authorization for the utilization of a Water-Power in the Province of Quebec, application should be made to the Honourable Minister of Lands and Forests.

Water-Falls capable of developing over 200 H.P. are granted under emphyteutic leases, the conditions of which are upon the following lines:

1.—Duration of the lease, from 25 to 99 years, according to the importance of the water-power and to the amount of capital required for its development.

2.—Payment of a yearly rental which does not vary during the term of the lease, for the land granted, counting from the date when the contract was signed.

3.—An additional yearly charge of from 10 to 35 cents per H.P. developed according to the geographical situation of the site of the water-power; such charge being payable from the time the power is produced.

4.—The above charge is subject to revision every 21 years counting from the signing of the contract.

5.—Delay of 2 years for beginning works and 2 further years fo producing power.

6.—The lessee to make a deposit in money or in securities as a guarantee of good faith of the carrying out of the contract. Such deposit may be forfeited if the conditions are not fulfilled; but it may be repaid after a certain time, in the contrary case.

7.—Lastly, the grantee must submit plans of his works, mills, etc., to the Department previous to their installation and when such installation is completed, he must keep the Department informed as to the quantity of power produced.

Link-Belt Chains
For Saw and Shingle Mills

Superior in design; workmanship; quality. Higher carbon steel pins.
Patterns full weight, full strength.

T-Head Rivets for "H" Class Chains

The chief cause of wear and elongation of pitch in an ordinary riveted chain is the rotating of the rivet in the eyes of the side bars.

In our Saw Mill Pintle Chains ("drive" chains) the rivet is prevented from rotating or rocking, by having the head notched at one side and engaged with a corresponding projection cast on the side bar.

In our Riveted Malleable Iron Saw Dust or Refuse Chains ("conveyor" chains), where the service is heavier, we provide a T-head rivet held securely between lugs cast on one side bar.

These are the only methods in use which *insure* prevention of rocking or rotation of the rivet.

As each link carries its own rivet, this improvement does not interfere with interchangeability.

The rivets are .40% carbon steel, rolled true and smooth after forging.

This process compresses the original hard scale surface, and materially increases the durability of the joint.

These rivets are now furnished in H-108 and H-124 Pintle Chains, and in all the Saw Dust or Refuse Chains, H-97 to H-480 inclusive.

This Trade Mark >——————< on every Link

If you need chain of any kind, come to us. We are prepared to supply the entire Link-Belt Line—active sizes in stock for prompt delivery. Ewart Link-Belt, "400" class chains, "E C" class drive chains, etc., etc.

You are never in doubt when you buy of Borbridge

Patented 1911

No. 152 Long Leg Seamless Heel Draw String Moccassins

The latest improvement in Moccasins doing away with all seams at heel. Under the old method the heel would come down and in a short time the wearer would be walking on it, wearing out the stitching, thus causing it to leak and rip. With the new process the heel will not flatten out, will always keep its shape and there are no seams whatever, making a clean smooth Ripless and Waterproof heel. Made only in the highest quality, all heights of leg, with or without soles or heels.

WRITE FOR CATALOGUE AND PRICE LIST

You are never in doubt when you buy from Borbridge. We have been dealing with the lumbermen of Canada for upwards of a quarter century.

DRYING VENEERS is one of the most important operations of veneer manufacture. The old method of drying in racks is too slow, and requires too much floor space and labor for handling.

THE "PROCTOR" VENEER DRYER

is an evolution of the rack drying method with the disadvantages eliminated. The **"Proctor"** Dryer is automatic and requires very little floor space, labor, and time for the operation. Veneer is dried by tremendous circulation of warm air.

HEISLER
Geared Locomotives

Are Used In Canada
From Anticosti, P.Q. to Vancouver, B.C.

THE Heisler Locomotive is built especially for operating over rough and uneven tracks up steep grades and around sharp curves. A marked saving is made in the building of railroads, as in many cases no ballasting or grading is necessary. The cost of rails is often reduced one half, likewise the number of ties and construction of bridges. Has no equal for operating over temporary tracks. All wheels are drivers. Truck swivel independent of each other and are flexible. Total weight equally distributed over all drivers, no dead weight. Built to gigs and templets and modern locomotive practice throughout.

Dominion Timber Regulations

Licenses to cut timber on Dominion Lands in the Provinces of Manitoba, Saskatchewan, and Alberta, the Northwest Territories, within twenty miles on either side of the main line of the Canadian Pacific Railway in the Province of British Columbia, and in the tract of three and one-half million acres to be located by the Government in the Dominion in the Peace River district in the Province of British Columbia, lying east of the Rocky Mountains and adjoining the Province of Alberta, shall be disposed of by public auction at the office of the Dominion Timber Agent for the districts in which the berths are situated.

Before any parcel of timber is offered for sale it shall be surveyed by a duly qualified Dominion Land Surveyor into berths of an area not exceeding twenty-five square miles, and each of such berths shall then be thoroughly cruised by a duly qualified timber cruiser in the employ of the Dominion Government. The Minister shall then fix an upset price at which the berth shall be disposed of, and no berth shall be sold at less than the price so fixed.

Purchases to the amount of one thousand dollars or under shall be paid in cash at the time of sale. Purchases over one thousand dollars and not exceeding five thousand dollars shall be paid, one-half in cash at the time of sale, and a note or notes shall be given for the remaining half of the purchase price, payable in three months, with interest at the rate of five per cent. per annum. Purchases over five thousand dollars and not exceeding ten thousand dollars shall be paid one-third in cash at the time of sale, and notes shall be given for the remaining two-thirds of the purchase price, payable in three and six months, with interest at the rate of five per cent. per annum. Purchases exceeding ten thousand dollars shall be paid one-fourth in cash at time of sale, and notes shall be given for the remaining three-fourths of the purchase price, payable within three, six and nine months, with interest at the rate of five per cent. per annum. Notes shall be made payable at a bank in the city or town in which the sale is held or at a bank in the city of Ottawa. Cash payments must be made at the time of sale in legal tender or by an accepted cheque on a chartered bank, or by a draft issued by a chartered bank, payable to the order of the Deputy Minister of the Interior. If default is made in any payment required by this section the sale shall be forfeited and void.

The purchaser must also pay the cost or the estimated cost of the survey of the berth before a license is issued.

The licensee shall pay an annual ground rent of five dollars per square mile except for lands situated to the west of Yale, in the Province of British Columbia, in which case the yearly ground rent shall be five cents per acre.

The licensee shall pay the following dues on timber cut on his berth :—

Sawn lumber, 50 cents per thousand feet, board measure.

Railway ties, eight feet long, 1½ cents each.

Railway ties, nine feet long, 1¾ cents each.

Shingle bolts, 25 cents per cord.

And 5 per cent. on the sale of all other products of the berth.

Timber Permits

Yearly permits are granted to settlers, mine operators and others on application to the Dominion Timber Agents, from whom further information can be obtained.

W. W. Cory,

Department of the Interior, Ottawa,
December 20th, 1912.

Deputy Minister.

Good Reasons

Why Lumbermen

should use D. K. McLaren's genuine British oak-tanned leather belting. Only the best centres of carefully selected hides are used, and these are tanned by the slow old fashioned British Oak method which assures maximum strength and durability.

It has a grip that means less slip—hence the transmission of more power.

It is thoroughly stretched before being placed on the market, assuring but little attention when in service.

May we have the opportunity of furnishing you with references and full particulars?

Genuine Oak

A guarantee that is on every D. K. McLaren high grade belting.

Goodhue

BELTS

Spell

Power Economy

We claim a lot for Goodhue Belts. They back up our claims every time. They have been running in many trying places where **ordinary** leather belts have been displaced. We have every confidence in our product and want a chance to prove their superiority over others.

For those damp places around the mill or for most power transmission needs around the lumber industry, we recommend our "Acme Waterproof" Brand.

"ACME WATERPROOF"

Only the finest selected hides are used in its construction and then only after a special treatment to render them more pliable than is usually the case. The "stretch" is practically eliminated, besides making the leather impervious to moisture and dampness from every source. We want you to put in an "Acme Waterproof" belt just as a trial. Put it on that wet hard drive where it has oil, dirt and water to contend with. You'll be convinced that our claims are sound after this trial. The belt will stay taut and not slip.

We have two other brands the "Extra" and the "Standard." Both equally as well constructed as "Acme Waterproof" but for different power uses. One of them is certain to meet your requirements. If you have ever had trouble with your belts ask your engineer what he thinks about it and give him a Goodhue belt to try

There are several features about our three Goodhue Belts. We would like you to know them. A postage stamp will get you the information and it may prove the solution of trouble you've been having with some particular belting. Send today for the details while you have the matter in hand.

The Canada Lumberman and Woodworker" is published in the interest of, and reaches regularly, persons engaged in the lumber, woodworking and allied industries in every part of Canada. It aims at giving full and timely information on all subjects touching these interests, and invites free discussion by its readers.

Advertisers will receive careful attention and liberal treatment. For manufacturing and supply firms wishing to bring their goods to the attention of owners and operators of saw and planing mills, woodworking factories, pulp mills, etc., "The Canada Lumberman and Woodworker" is undoubtedly the most direct and profitable advertising medium. Special attention is directed to the "Wanted" and "For Sale" advertisements.

Authorized by the Postmaster General for Canada, for transmission as second class matter.
Entered as second class matter July 18th, 1914, at the Postoffice at Buffalo, N.Y., under the Act of Congress of March 3, 1879.

Vol. 36 | Toronto, May 15, 1916 | No. 10

Our Annual Number

The present issue of the Canada Lumberman is in many respects different from all of the previous annual issues that we have published. In bringing out this year's number we have had in mind the preparation of a journal which, while not including so much as usual in the way of articles showing the growth of the industry in Canada, will give an impressive idea of its magnitude and of its many-sided interests. The articles that make up this number deal with a remarkably wide range of subjects that are of practical interest to the industry. They cannot fail to impress one with the fact that in the production of lumber in Canada there are presented a variety of problems such as can scarcely be found in connection with any other Canadian industry.

In all its aspects, from the cruising of the limits, to the use of the finished product, the lumbering industry presents a wonderful range of activities. These activities we have sought to indicate and describe, not so much by our own effort as by the effort of those who are themselves engaged in the industry. The special articles which make up practically the whole of this issue are the work of men who have spent their lives in the industry itself and who know from practical experience the details of the subjects they are discussing. For this reason we feel that this issue is much less one of our production than the production of the industry itself, and therefore, all the more valuable to our readers. It is a source of continual gratification to us to to see that those who have their life work in the lumbering industry and trade are so ready to co-operate with us in the preparation of an annual number that shall be a credit to the industry itself.

While we have sought to have this issue reflect the activities of the industry in general, there has crept into it almost irresistably one feature which is indicative of a very important development in the lumbering industry and trade in Canada today.' During the past few months we have seen a great awakening of interest among Canadian lumbermen and lumber consumers in the lumber products of their own country, and perhaps more than anything else this movement has been characterized by the aggressiveness with which the Government and the manufacturers of British Columbia have been pushing their market boundaries beyond their old limits. In Eastern Canada we have seen the effect of this campaign more forcibly than anywhere else. We had become accustomed to thinking that the quantity of B. C. lumber products that could be disposed of in Ontario, Quebec and the Maritime Provinces was strictly limited, but since the Government of British Columbia has opened up a lumber commissioner's office in Toronto and the manufacturers of British Columbia have been pushing the sale of their products in the east our old ideas have been roughly upset and today we are apparently at the beginning of an era in the east which will be characterized by a great increase in the demand for B. C. lumber products. We believe that this is the first instance in Canada of a provincial government seeking to stimulate trade east and west between the provinces, and we look to see the time, in the near future, when the wisdom of this course will have been amply demonstrated. In fact, we are certain, on our own account, that the demonstration has already been made and that the usefulness of this work will be rapidly increased.

The publication of an extensive annual issue like the present one, while it entails a good deal of special work on the part of those who are engaged in its actual appearance, also involves a great deal of work on the part of those who contribute to its columns, and is a striking illustration of the fact that the lumbering industry, in spite of all the difficulties which it has been experiencing during the past two or three years, is one of the most progressive and active industries in Canada. One would never gather, from the columns of this issue, that there is anything but optimistic enthusiasm in the lumber business of Canada today. While there is much to be regretted in regard to the actual trade situation in many parts of the country, there is little for which the lumbermen are themselves directly responsible and which they are not doing all they can to remedy. The adversities of the last few years have developed aggressiveness and determination in the best minds in the lumber business and are, we believe, doing much to bring to the top of the business those men whose influence in the days to come, when peace has been established, will be influential in rapidly restoring to the business its former greatness, and even developing it into a larger and more important industry than it has been.

Reduction in Workmen's Compensation Rates

Favorable Results in Lumbering, Woodworking, etc., lead to lower cost for 1916 —Results of 1915 Operation.

Ontario lumbermen have been so closely in touch with the effects of the Workmen's Compencation Act since its inauguration in the province on January 1st, 1915, that the results of the first year's operations, and the situation as it exists today are of importance to them all. The Workmen's Compensation Board has furnished the Canada Lumberman with special information about the results of the first year's operation of the act and exclusive information regarding changes to be made in the rates charged in connection with a number of lines of industry during 1916. The most important feature of this information is that in relation to the new rates. In advising the Canada Lumberman of the changes, the Workmen's Compensation Board say:—

"The aim of the Board is to make the rates for each kind of industry conform to the actual cost for such industry.

"The rates fixed for 1915 before any experience had been had in the actual operation of the new Act were necessarily based upon other tables of rating with allowances for the difference between the provisions of the Ontario Act and the covering of the other ratings. We have now had one year's experience, but the actual figures for the year are still incomplete, inasmuch as at the close of the year many claims for accidents happening during 1915 had not yet been filed, or, by reason of continuing disability or incompleteness of reports, had not been finally dealt with, and inasmuch as the assessments, which were based upon estimated payrolls, had not been adjusted to the actual payrolls.

"With the help of estimates, however, the situation has been gauged as nearly as possible. This has been done not only with respect to each class of industry but also, as far as could be, with respect to each particular line of industry in the class, and the rates for 1916 have been fixed accordingly.

"While in a few cases it has been deemed necessary to increase the rate, there is for 1916 in most cases a reduction from the 1915 rate, in many cases a very substantial one. In cases where the surplus was large it has been reduced by lowering the rates for 1916 retroactively.

"Separate account is kept of all the moneys received and paid out in respect of each class of industry, and the standing of each class is considered separately. It is very essential that within the class each kind of industry shall bear its proper proportionate rate, but it is immaterial to employers in one class what the rate may be in another class. If there is a surplus in the class it means a subsequent lowering of rates, while if there is a deficit it will mean an increase."

Reductions in the Rates

The rates for 1915 and the new rates for 1916 in connection with lumber, logging, river driving, woodworking, etc., are as follows:—

Industry	1915 rate	1916 rate
Lumbering, logging, river driving, rafting and booming	$2.00	$1.80
Saw, shingle and lath mills	1.80	1.50
Manufacture of		
Veneer or excelsior	1.60	1.50
Staves, spokes or headings	1.80	1.50
Lumber yards (including delivery) carried on in connection with sawmills	1.80	1.50
Planing mills, sash and door factories, and lumber yards (including delivery) in connection with planing mills or sash and door factories	1.50	1.30
Manufacture of		
Wooden boxes, cheese boxes and mouldings	1.50	1.30
Ammunition shell boxes	1.50	1.00
Cigar boxes	1.50	.70
Window and door screens	1.20	1.00
Wooden articles or wares or baskets, matches or wooden toys	1.20	1.00
Vehicle woodwork (retroactive)	1.20	1.00
Furniture, interior woodwork, fixtures, etc.	.80	1.00

The results of the operation of the act during 1915 show many interesting points. The total number of accidents reported was 17,033. Assessments collected from employers amounted to $1,539,492. The amounts distributed to employees and their families amounted to $1,186,221. There was thus a surplus of assessments over distributions amounting to $395,026.

Compensation was given in 9,829 cases. Among these the parties benefiting included 65 widows, 116 children, 35 mothers, and 10 fathers. The cost of administration of the Act for 1915 was $100,846. Cheques to the number of 150, on the average were sent out from the Board's offices daily, amounting to about $3,600.

In its report for the year the Board says:—"Though, in view of the unavoidable incompleteness of the actual figures the first year's experience cannot be regarded as conclusive, it indicates that the financial burden of the new law will be less than was anticipated. The assessments levied for 1915 are in most cases more than sufficient to meet the requirements. Though in a very few instances the bad accident record has called for an increase in rate, the Board has felt warranted in making substantial reductions in most classes of industry. In a number of classes or parts of classes, where the experience was good and the surplus large, reductions are being applied retroactively for 1916."

Benefits of the Act

"The Act has worked smoothly and satisfactorily. The benefits of the new system of law to both workmen and employers are recognized and appreciated. Claims are expeditiously and inexpensively disposed of. Employers are immune from the expense and annoyance of litigation. The intricacies and hardships upon workmen and their families of the old doctrines of negligence and assumed risk are eliminated. The facts to be determined by the Board are usually few and simple. There is no longer the need for payment of legal fees either by workmen or employers."

Evidence that employers as a whole have been satisfied with the working of the Act in its first twelve months is shown by the fact that many employers have asked that industries or operations carried on by them which are not now under the main schedule of the Act should be included.. Although the Act introduced a rather radical alteration in compensation methods, the co-operation shown by all parties in the first year's experience has been excellent and steadily improves.

Fifteen safety associations were brought into existence, the salaries and expenses of the inspectors being paid in most instances by the Board. The educative and preventive work carried on by these inspectors, devoting themselves as they do to one group of industries, is of the most valuable order.

The need for such supplementary work is proved by the records of accidents in Ontario industries. Twenty-one set screws which the Board says might have been countersunk for about $7.35 were responsible for an accident burden of $5,619.39. Open shafting and conveyors which might have been covered for a few dollars wounded 66, killed 4, and crippled 37 wage earners. Because two elevators lacked automatic locks, two lives were sacrificed and a compensation burden imposed of $6,179.06. Here is a fruitful field for the safety inspector.

Litigation Eliminated

The abolition of litigation is one of the most satisfactory benefits of the Workmen's Compensation Act to both employer and employee. More than 17,000 claims were disposed of without recourse to courts, or any friction between master and man.

The manner of dealing with claims is simple and informal. Notice of the accident is required to be sent in by the employer within three days after it occurs. The workman makes a similar report, which is supplemented by the attending physician. Promptly upon the receipt of the latter evidence, a cheque is mailed, seldom with more delay than two or three days, unless a special investigation is necessary; in that case temporary payments may be remitted to the injured party.

In the operation of the Act, great care is taken to guard against all forms of imposition. The ambitious workman, eager to return to his employment and overcome his handicap through injury is not placed at a disadvantage as compared with a comrade who makes no such effort. Individual circumstances may, and often do, vary the amounts set forth in the table of allowances. This power to discriminate has been especially needful in the rating of "permanent disabilities," for which a workman is entitled to 55 per cent. life pension, based on the extent of his impairment.

Lieut. L. F. Strickland

Lieut. L. F. Strickland

Lieut. L. F. Strickland, of the 224th Foresters Battalion, whose portrait we publish herewith, is well known to the lumber trade of Toronto, having been connected for several years with the Canada Lumber Company of Weston, Ont., which conducts an extensive retail trade in Toronto and its outlying districts. Lieut. Strickland was well known as one of the energetic and progressive younger members of the trade, having been prominent in most of the co-operative association work carried on by the trade during the past few years. The Canada Lumber Company was founded only a few years ago by the late Mr. Strickland, Sr., father of Lieut. L. F. Strickland. From the first it made its influence felt strongly in the retail trade.

After the death of Mr. Strickland, Sr., Lieut. L. F. Strickland assumed the management of the company. Although a comparatively young firm, it has already made rapid progress and has worked up quite an extensive business, operating a plant for the production of most of the important classes of interior finish.

Lieut. Strickland's business experience has been practically all in the lumber business. For some months he was employed in a warehouse in Columbus, Ohio, learning the lumber business. Then he came to Toronto with his father and continued with the Canada Lumber Company. When the war broke out he devoted a great deal of his attention and energy to the work of recruiting. He was associated with the 109th regiment from the time when it commenced recruiting and he stuck to this work faithfully until he felt that it was his duty to take on more active work in connection with the war. Having qualified as a lieutenant he was appointed to the 224th Forestry Battalion, for which his acquaintance with the lumber business gave him special qualifications, and he went overseas with this battalion.

Muir, Kirkpatrick & Sharpe Increase Their Forces

Mr. R. R. Stewart, formerly with the Long Lumber Company, of Hamilton, Ont., has joined the selling force of Muir, Kirkpatrick and Sharpe, 1123-4 Traders Bank Building, Toronto. The acquisition of Mr. Stewart by this firm is a step upon which they are to be greatly congratulated, as he is one of the best-known lumber travellers in Ontario. He has covered Ontario for the former firm during the past nine years and is in close touch with every dealer in the province.

Messrs. Muir, Kirkpatrick & Sharpe have also added to their selling force in Western Canada by taking over the Vancouver office of W. R. Chandler. Mr. Geo. R. Potter, former sales manager for W. R. Chandler, will be in charge of the western business for Messrs. Muir, Kirkpatrick and Sharpe and will cover British Columbia and the prairie provinces. Mr. Potter has one of the finest trade connections in the lumber business in Western Canada and is known to practically everybody who buys lumber.

The Oliver Lumber Company of Toronto Limited, have moved their offices from the Confederation Life Building to the Lawler Building, at the corner of King and Yonge Streets.

Mr. Hugh A. Rose, formerly eastern representative of the Canadian Western Lumber Company, Fraser Mills, B. C., has accepted a position as representative for Mason, Gordon & Company, Montreal, P. Q. He will open an office in Toronto immediately.

Mr. W. P. Kearney, vice-president and general manager of the Dominion Chain Company, Limited, Montreal, who is a captain in the 55th Irish Canadian Rangers, is now actively engaged in recruiting for the 199th Battalion.

Mr. J. L. Campbell, of Campbell and Paynes, Toronto, is on a visit to Winnipeg and other prairie province points in connection with his business interests there.

Mr. A. A. Titcomb, who travels Canada in the interests of the Jones Hardwood Company, Boston, Mass., is expected in Montreal the last of this month.

Vancouver Lumber Company Open Toronto Office

Chas. Plant, Toronto

The Vancouver Lumber Company, Limited, Vancouver, B. C., having been impressed by the remarkable awakening of interest in British Columbia lumber that is taking place in Ontario and eastern Canada, have opened an office in Toronto, where they are located at 701 Excelsior Life Building, with Mr. Chas. Plant as their representative. The office was opened about May 1st and Mr. Plant is now busily making himself known to the trade.

The Vancouver Lumber Company, Limited, is one of the largest and most important lumber manufacturing concerns in British Columbia. It has two mills, one which is known as the fir mill, being located at Vancouver. This mill cuts about 200,000 feet of lumber per day, producing large timbers, fir upper grades, such as flooring, ceiling etc. Their other mill is located at Roche Point on Burrard Inlet, about nine miles up from Vancouver. This is a cedar mill with very fine up-to-date equipment, including twelve upright machines. At this mill the company specialize in XXX and XXXXX shingles, turning out a very fine line of these grades. Their product is practically 100 per cent. clear and 100 per cent. vertical grain. The company also turn out a specially attractive line of cedar bevel siding.

Mr. Chas. Plant is an Englishman who came to Canada about 1910, and joined the staff of the Arrow Lakes Lumber Company, with whom he remained for about two years. Then he became associated with the Vancouver Lumber Company and has continued with them ever since. At first, he was employed in their office, assisting the sales manager. About the beginning of 1914 he was sent to Winnipeg and represented the company in the middle west. Then, when the war commenced, the Vancouver Lumber Company opened an office at Minneapolis, Minn., and Mr. Plant was placed in charge. Now that the company have decided to enter the eastern Canadian market actively, they have concluded that Mr. Plant is the logical man for the task. Mr. Plant will devote his attention to the trade in eastern Canada and will have his headquarters at Toronto. We are pleased to be able to publish a portrait of Mr. Plant, with whom a large number of our readers will soon become personally acquainted.

British Columbia Log Output

Reports from Vancouver indicate that during the month of May a record will be made in British Columbia logging operations. Stocks are lower than at any time in the past ten years and operators are working extensively. A number of new operations are reported at Wolfssohn Bay and other points on the coast. Over 34,000,000 logs were scaled in the Vancouver district during March and an equal number during April. Storms during the middle of April tied up many booms in harbor. When finer weather came there was a rush of logs to port which brought the total up rapidly. During the last week in April and the first week in May the logs scaled easily exceeded the quantity in any previous similar period. Among the new logging operations reported is one by the Haslam Lake Lumber Company at Wolfssohn Bay, one by Lamb Bros., who have taken over the Vancouver Timber and Trading Company's railway at Wolfssohn Bay, a new railway logging camp by P. B. Anderson at Shookum Chuck, Jervis Inlet; a new camp at Seymour & Company, at Narrows Arm, Sechelt, and a new camp by T. Highland at Turner Island. There are also a number of smaller operations begun in the coast district.

The timber statement for the month of March, issued by the Minister of Lands, shows that the total scale of saw-logs for the province amounted to 43,858,794 board measure, in addition to 149,337 lineal feet of poles and piles, and 11,216 cords of ties, shingle bolts, fence-posts, etc. The saw-logs scaled in the various districts include Vancouver, 34,279,501 feet; Cranbrook, 4,145,025 feet; Island, 3,325,818 feet; Vernon, 1,377,528 feet; and Nelson, 386,782 feet. Of poles and piles there were scaled in the Nelson district, 60, 428 lineal feet; Island, 36,900 feet; Prince Rupert, 21,763 feet, and Vancouver, 13,421 feet. Timber sales recorded during March cover an estimated total of 6,581,940 feet. B. M. saw-logs; and 28,140 lineal feet poles and piles, to produce a revenue of $9,752.

Mr. Wm. Power, M.P., of W. & K. Sharples, Quebec, P.Q., has returned from his annual visit to Great Britain.

Revising B. C. Grading Rules

Descriptions and Definitions of Various Species and Grades, to Facilitate Trade

In the grading of lumber the manufacturers of British Columbia have probably made greater advance than those in any other part of Canada, having drawn up and put in to effect definite sets of grading rules in connection with various important lines of lumber. Today, the B. C. Lumber & Shingle Manufacturers' Association has a special committee at work on a revision of its grading rules. Of late years the market for B. C. manufactured lumber has been reaching out into many new districts and the manufacturers are finding it more and more necessary to be able to describe definitely just how the various lines of stock are manufactured, so that buyers will know what it is best for them to order for the particular purpose which they have in mind. This idea is not only for the convenience of the buyer, but also for that of the manufacturer. In a great number of cases enquiries and orders are received upon which it is not possible to give a quotation, much less fill them, without a great deal more information than is given. British Columbia manufacturers are finding out that this class of order comes especially from Eastern Canada and the United States, where buyers are not yet familiar with their woods.

The intention in preparing a revision of the grading rules is that the new rules shall give descriptions of the various species of merchantable timber found on the coast in British Columbia, the particular qualities of each species and the uses for which each particular kind of tree is best fitted.

In British Columbia the manufacturers have established the custom, especially for Canadian and United States trade, of drying, dressing and finishing the lumber at the sawmills, so that it is ready to hand over to the carpenter on the job. This, they believe, is an improvement on the custom in the east, which requires that lumber shall be sawn and seasoned at the sawmill and shipped thence to the planing mills and woodworking factories for further manufacture.

British Columbia manufacturers receive many enquiries and orders for a certain number of pieces and finished of dressed lumber of certain specified lengths, for instance:—flooring or ceiling will be ordered all 16 feet long, or so many pieces 10's, so many pieces 12's, 14's and 16's. This system is even carried out to the mouldings, increasing tenfold the difficulty of filling the order, with no particular advantage to the buyer.

Matters of this kind will be pointed out forcibly in the revised grading rules and an endeavor will be made not only to standardize the B. C. finished sizes, but to make them correspond as much as possible with the rules and regulations governing other large lumber associations, the idea being that in the course of time Pacific Coast sizes and grades will be uniform. The revised rules will also point out the particular grades that buyers should use for particular work. For instance, a short time ago a contractor in B. C. was buying buffers for a large scow. The architect specified the best clear Douglas fir timber. It would have been much better to have specified good No. 1 common grade, with plenty of knots to prevent a tendency to split.

Similarly, in the matter of shop lumber for panels and door and window manufacture, the size and nature of the defects are of no particular importance, provided the lumber is clear between them; so that a fir board, not fit even for shiplap or No. 2 common boards, might be very desirable for door panels. In the same way, it is easily understood that, in connection with flooring, the length of the piece is not nearly so important as the grade.

Generally, the revised grading rules are intended to supply full and definite information to the retail dealer so that he may advise his customers exactly what is best for them to buy for the particular work they have in hand.

This work of drawing up grading rules is by no means a simple matter. Widely varying interests are affected so closely that only the most thorough enquiry into all the circumstances will result in serviceable rules. It usually takes a lumber association anywhere from six to twelve months to gather the necessary information for compiling a proper set of grading rules.—Geo. B. Cross.

A Modern Paper Plant for Ocean Falls

Lewis Bloch, formerly of San Francisco, will have charge of the installation of the paper mill which is being established in connection with Pacific Mills, at Ocean Falls, B. C., by the Fleischacker and Johnson interests of San Francisco, which also control the Crown Willamette paper mills in Oregon. The Ocean Falls proposition, representing an investment of $3,250,000, was promoted some years ago by Lester W. David, of Seattle. It includes 60,000 acres of timber, much of which is suitable for pulp paper purposes; a sawmill with a cutting capacity of 400,000 feet of lumber a day; and a modern pulp paper plant.

Business Commission Going to Europe

In the House of Commons recently Sir George Foster, Minister of Trade and Commerce, announced that a Commission of business men had been appointed by the Government to visit the United Kingdom, France and Belgium, with the object of investigating opportunities for extending Canadian trade in those countries. The Commission, which will be an honorary one, will consist of Mr. Jas. W. Woods, Toronto, former president of the Toronto Board of Trade; Theo. H. Wardleworth and Frank Pauze, of Montreal; H. E. Duper, Quebec: P. Q.; Frank H. Hatheway, St. John, N. B., and Geo. Allan, Winnipeg. Mr. Frank Pauze is well known to the lumber trade in Montreal as a member of the firm of U. Pauze and Son, sash and door manufacturers, Montreal. He is already in France, having gone there about a month ago as a representative of the Canadian Timber Products Association. It is expected that the Commission will all have assembled in Europe by midsummer.

B. C. Shingles to be Standardized

Manufacturers and Government Adopt Plan for Stamping Grades on Bundles—The New Rules

Mr. Joseph Chew, Vancouver, B.C., visited Eastern Canada recently and called upon a number of his old friends in the trade. Mr. Chew reports that the shingle manufacturers of British Columbia have recently adopted an important reform in connection with the grading of B. C. shingles. Realizing the necessity for standard and dependable grades, the manufacturers have drawn up a set of rules which have been agreed to by the association, and the British Columbia Government has consented to assist in standardizing these grades, by appointing inspectors and furnishing an official stamp for identifying the grades. These stamps are to be furnished to manufacturers who join in the movement. The manufacturers will do their own inspecting and grading, and the Government inspectors will watch the grading of all manufacturers who use the Government stamps. Any manufacturer placing the stamps upon shingles that will not stand the inspection is to be liable to a fine of $100 for the first offence and more serious punishment for further offences.

The grading rules which are thus officially established by the manufacturers and the Government are as follows:—

No. 1 B. C. Shingles Are All Edge-Grain, Strictly Clear and Well Packed

There are four kinds of No. 1 B.C. shingles, based on variations in thickness and length, known and sold under the following names:—

XXX, XXXXX, Eurekas, Perfections

XXX.—16 inches long, allowing 1 inch over and 1 inch under this length; 6 to 2's; i.e., thickness of butts of 6 shingles measured green is at least 2 inches. When dry a bunch will measure not less than 8 inches at the butts. Smoothly sawn, squarely jointed, and well manufactured. Packed 25—25 courses to bunch, 4 bunches to the M. Well suited for steep-pitched roofs or roofs or granaries, implement-sheds, etc.

XXXXX.—Same length as XXX; 5 to 2's; i.e., 5 butts to 2 inches when green. When dry a bunch will measure not less than 9¾ inches at the butts. Packed 25—25 courses to bunch, 4 bunches to M. Most universally used shingle manufactured in British Columbia; recommended for any substantial building, especially houses, barns, churches, etc.

Eurekas.—18 inches long; can show more face to weather than 16-inch shingle. Same thickness as XXXXX. Packed 25—25 courses to bunch, 4 bunches to M. Suited for low-pitched roofs.

Perfections.—18 inches long, same as Eurekas; 5 to 2¼ inches; i.e., 5 butts to 2¼ inches when green. When dry a bunch will measure not less than 8¾ inches at butts. Packed 20—20 courses to the bunch, 5 bunches to the M. Long-lived owing to thickness; artistic effect secured by means of the heavy butts.

Lower Grades

10-inch Clears and Better.—Shingles packed with 10-inch and better clear butts may be had in any of the thicknesses of No. 1 shingles. They contain all the flat-grain clears and clear feather-tips which develop.

XX.—May be had in any of the above thicknesses. Packed with 6-inch to 10-inch clear butts and contain the fall-downs from the better grades.

Lumber Production in Canada During 1914

Comparative Statistics of Relative Output and Total Production in all Provinces

A bulletin dealing with the production of lumber, lath and shingles in Canada during 1914 has been published by the Forestry Branch, Ottawa. The statistics are prepared from reports received from 2,843 firms or individuals operating saw or shingle mills.

The total production for 1914 includes, 3,946,254,0000 feet board measure of sawn lumber valued at $60,363,369; 625,010,000 lath valued at $1,585,484; 1,843,554,000 shingles valued at $3,688,746; making a total value for the three classes of products of $65,637,599.

Lumber Production

The following table gives a summary of the information concerning the production of sawn lumber classed by provinces.

	Number of Firms Reporting		Quantity	
	1913	1914	1913	1914
			M. Ft. B.M.	M. Ft. B.M.
Total, all Provinces	**2,187**	**2,843**	**3,816,642**	**3,946,254**
Quebec	684	1,314	630,346	1,118,298
Ontario	685	718	1,101,066	1,044,131
British Columbia	159	172	1,173,647	936,612
New Brunswick	177	160	399,247	414,808
Nova Scotia	322	332	247,722	279,044
Saskatchewan	25	17	114,800	56,677
Alberta	40	47	44,462	45,236
Manitoba	50	40	71,961	44,658
Prince Edward Island	45	62	6,391	6,790

	Value of Lumber	Average Value per M. Ft. B.M.	
	1914	1913	1914
Total, All Provinces	**$60,363,369**	**$17.24**	**$15.30**
Quebec	17,444,980	16.85	15.60
Ontario	19,719,972	23.41	18.89
British Columbia	10,724,424	14.00	11.45
New Brunswick	6,374,293	14.42	15.37
Nova Scotia	3,908,244	13.36	14.01
Saskatchewan	842,664	16.62	14.87
Alberta	649,146	13.69	14.35
Manitoba	601,728	13.15	13.47
Prince Edward Island	97,918	13.32	14.42

The total is an increase of 3.4 per cent. over that of 1913. The three Maritime Provinces all increased their production of lumber. The closing of the Baltic ports and the interruption of the lumber trade with Scandinavia resulted in an increased export trade in this commodity from America to Great Britain and France. The cut in Quebec is probably an increase also over that of 1913, but this fact is obscured by the much greater completeness of the returns for 1914. Alberta increased her production by 1.7 per cent. while Ontario, Manitoba, Saskatchewan and British Columbia all show decreases.

The average prices given are prices at the mill for sawn material. The average for the whole of Canada shows a decrease of only $1.94, which is a remarkably small decrease in view of existing conditions. The price fell in the three most important lumber-producing provinces, Quebec, Ontario and British Columbia, and also in Saskatchewan. In the remaining five provinces including the three Maritime Provinces a slight increase is to be noted.

The production in 1914 includes lumber cut from at least fifty different tree species. In the reports received from the sawmill operators and on the market generally the lumber cut from these different trees is grouped wherever its properties are of a similar nature. There is only one species each of Douglas fir, beech, basswood and butternut cut in Canada, but there are at least five spruces, four balsam firs, and four birches.

A decrease of 24.1 per cent. in the cut of Douglas fir has caused this wood to fall from second to third place on the list. The greater completeness of the reports from Quebec, where balsam fir is an abundant species, has brought this wood up from tenth to fifth place on the list. The cut of spruce increased by over 13 per cent. and formed in 1914, 36.5 per cent. of the lumber cut in Canada. Other increases among the more important woods are to be noted in the cases of hemlock, balsam fir, cedar, jack pine, basswood and poplar; and decreases in white pine, Douglas fir, red pine, birch, tamarack, maple, yellow pine and elm. Among the fifteen most important woods cut in Canada the greatest increase in production was in balsam fir and the greatest decrease in western yellow pine.

The average mill price of lumber produced in 1914 decreased by $1.94 per thousand feet. Out of the total twenty-seven kinds reported only five increased in price from 1913 to 1914. These were balsam fir, maple, chestnut, cherry and tulip. In every other case the mill price decreased.

Lumber Cut, 1913 and 1914, by Kinds of Wood

Kind of Wood	Quantity		Total value of lumber	Average value per M. Ft. B. M.	
	1913	1914	1914	1913	1914
Total	**3,816,642**	**3,946,254**	**$60,363,369**	**$17.24**	**$15.30**
Spruce	1,274,215	1,441,438	$21,199,799	$15.01	$14.71
White Pine	678,330	667,678	13,880,255	27.28	20.79
Douglas Fir	793,143	601,643	6,810,000	13.74	11.32
Hemlock	306,342	334,361	4,734,229	14.71	14.16
Balsam Fir	64,957	256,452	3,654,741	13.02	14.25
Cedar	101,053	118,738	1,294,238	14.72	10.90
Red Pine	144,320	107,763	1,935,543	18.63	17.96
Birch	79,369	76,424	1,247,816	17.95	16.33
Tamarack	96,325	71,791	882,188	13.77	12.29
Maple	73,580	66,610	1,283,643	17.71	19.27
Jack Pine	35,404	44,000	626,108	14.37	14.23
Basswood	36,009	38,013	752,108	21.48	19.79
Yellow Pine	58,939	34,616	463,525	14.83	13.39
Elm	30,766	29,490	610,041	21.25	20.69

Softwoods vs. Hardwoods

Softwoods vs. Hardwoods—Total Quantity and Percentage each Form of the Total Lumber Production in Canada and in each province

Province	Softwoods		Hardwoods	
	Quantity M Ft. B.M.	Per cent. of total	Quantity M Ft. B.M.	Per cent. of total
Total, All Provinces	**3,678,499**	**93.2**	**267,755**	**6.8**
Quebec	1,053,678	94.2	64,620	5.8
British Columbia	929,381	99.2	7,231	0.8
Ontario	884,843	84.7	159,288	15.3
New Brunswick	403,565	97.3	11,243	2.7
Nova Scotia	255,795	91.7	23,249	8.3
Saskatchewan	56,672	100.0	5	*
Alberta	44,813	99.1	423	0.9
Manitoba	43,936	98.4	722	1.6
Prince Edward Island	5,816	85.7	974	14.3

*Less than one-tenth of 1 per cent.

Canada's lumber-producing trees are largely softwoods and lumber of this description formed 93.2 per cent. of the total, practically the same proportion as in 1913. In the production of this class of lumber Quebec leads. British Columbia cuts more softwood than Ontario although its total production of lumber is less. In Quebec, the Maritime Provinces and the Prairie Provinces the most important softwood is spruce. In Ontario white pine has always headed the list and in British Columbia, Douglas fir.

Ontario is the most important hardwood-producing province, cutting over twice as much as Quebec which comes second on the list. The other provinces in order of their importance as producers of hardwood are as follows: Nova Scotia, New Brunswick, British Columbia, Prince Edward Island, Manitoba, Alberta and Saskatchewan. In Quebec and the three Maritime Provinces birch is the most important hardwood. In Ontario maple heads the list and in the three Prairie Provinces aspen poplar. Cottonwood poplar is the most important deciduous-leaved tree in British Columbia.

Mr. A. J. Morris, of the Wilson Lumber Company, 1 Spadina Avenue, Toronto, has left on a fortnight's business visit to Eastern Canada. He will visit Montreal, St. John, Halifax, Truro, Amherst and Sydney.

The Reader's Viewpoint on Current Topics

Concensus of Opinion Inclines Toward an Optimistic But Cautious View of Trade Outlook

Future Prospect Undoubtedly Encouraging

Editor Canada Lumberman:— North Tonawanda, N. Y.

It is a well-known fact that students of trade, and financial statisticians agree that trade rises and falls as do the tides, and that action and reaction in trade are substantially equal except that there is a little more prosperity than depression, owing to the gradually increasing wealth of the world.

Since the early part of 1907, the lumbermen have hardly had a fair share of prosperity. While there have been a few moderately bright spots, the first real sunshine came with the recent rise, starting in the fall of 1914. While lumber, particularly southern product, has advanced sharply, the manufacturer is not making more than a fair profit at the present time, certainly not an exorbitant one. Large owners of timber at the present time are perhaps only making a fair interest rate on their investment.

It would seem that at least two or three years of substantial prosperity would little more than make up for the depression of previous years, which was most acute in 1914, and the early part of 1915.

Lumber is a crop, much the same as grain, and owing to the heavy snows of the past winter, and the fact that there have been comparatively few new operations started, there will likely not be an over-production of lumber for some time to come. For these reasons we look on the future as extremely bright, particularly so for the people who are fortunate enough to live on this North American Continent.

Our firm, Smith, Fassett & Company, manufacture spruce in New Ontario and at Lumsdens Mills. We have been in the white pine business in Tonawanda for forty years, and are interested in some southern plants, manufacturing yellow pine. We find practically the same conditions exist in these different localities.

We feel that the moderate rise in price of lumber is certainly warranted. We base this opinion largely on the experience of the companies in which we are interested.

Some of the eastern lumber dealers, particularly those supplying the Atlantic coast, have been more or less distressed with the idea that the Pacific coast would be a serious competitor on account of the low freights made possible by the Panama Canal. While the west coast is bound to be a competitor of eastern manufacturers, we do not regard this competition as at all serious for the present, as, for some time to come freights will be practically as high by water as by rail.

The west coast is having a heavy demand for its material from Pacific coast and foreign sources, and the introduction of these woods in the east is still in its infancy. Their increase will probably be compensated for by the decreased production of Atlantic coast manufacturers. Then too, the recent experiences of manufacturers in the west, and the record of the past few years, will probably not encourage investors for some time to come.

When we get back to normal freight rates on the ocean, and ships are available for the transport of lumber from Vancouver or western states to Atlantic coast ports, these freights will probably range in the neighborhood of $12 and can only be done at this price on ships carrying upwards of three million feet. This will necessitate redistribution at some Atlantic coast port, and the expense incident will tend to equalize the difference between low water rates and what we are now paying by rail, and the education of eastern people for the more generous use of the western woods will undoubtedly be delayed for some time.

To summarize—we believe that the amount of lumber in sight at the present time is unusually small. The manufacturing capacity has not increased in recent years. We have a good deal to make up in the way of profits, and the foreign demand for lumber will continue for some time after the war.

Therefore, the future, in our opinion, is undoubtedly a hopeful one.—Smith, Fassett & Company.

Co-operation By Unionism

Editor Canada Lumberman: Grand Forks, B.C.

The manufacturers of lumber today realize more fully than ever before the needs of a wider market for the relief of the industry. Other industries are a success solely because there are organizations binding together the manufacturers and dealers. No other industry in Canada is more important to the general public than the lumber industry, and if an organization along union lines were consummated general benefit would accrue to the greatest number of the people. Such an organization would be of particular benefit to the province of British Columbia, especially if formed of all manufacturers and the dealers west of the Great Lakes. Its success would be immediately apparent if a twofold policy were adopted; Service to the lumberman and service to the public.

An organization could only be a success when it increased the profits of its members and at the same time resulted to the good of the public.

Price combination should be avoided.

The aim of the union should be the standardization of material and working conditions, to increase the efficiency of its members by discussion and inspiration, to limit the production of certain kinds and grades, to use every legitimate means for reducing costs by speeding up, to conserve the timber, to plan trade economies, to keep down the overhead, etc.

It would also be necessary to have the right men at the head of the Union. A governing board should be appointed consisting of the past presidents and vice-presidents of the smaller associations. As a rule, men do not receive these prominent positions from their respective associations without being amply qualified. The greater number of them started in the industry as lumber jacks or mill laborers and have become owners of successful institutions, either as manufacturers or dealers. The majority of the manufacturers have a thorough knowledge of the mechanical requirements, but are slack on buying and selling. The meetings of the smaller associations and the board would give the members the inspiration to develop along those lines, to realize the value of team work, to learn to advertise efficiently and effectively, and to become efficient merchants who understand thoroughly both ends of the industry.

The needs of co-operation along the lines of unionism are apparent, if carried out along the lines enumerated above. The manufacturers agree that something must be done and if the dealers of the west would join with them, the success of the industry would be assured permanently. Let us hope that some action along the lines enumerated above will be taken before overproduction again forces the mills to close down.—W. Mark De Cew.

Trade Prospect Improving

Editor Canada Lumberman: Marmora, Ont., May 1st.

There has been ample water for log driving, and our foreman reports good progress, especially during the last ten days. Another week will enable him to get his stuff through safely, and we do not anticipate any trouble whatever, so far as getting our logs in is concerned.

A year ago we carried on no logging operations whatever, and the generally depressed conditions of the lumber market during the past year have shown that it was wise not to cut any. We have taken out a small cut during the past winter; this, however, being just enough to give us an assortment of sizes wanted for our anticipated trade during the coming summer. Prospects appear somewhat brighter. We have had numerous enquiries, especially for hardwood stocks, and for hemlock timber.

The local building conditions were generally quiet during 1915. The farmers in this section have been making some additions and in some cases are arranging to build new houses and barns, resulting in a limited local demand. Although some parties are complaining of threatened scarcity of labor, we have been able to secure the required help up to the present time.

As wages are likely to advance, prices of the new cut will have to improve considerably in order to cover the extra cost of manufacture.—The Pearce Company, Limited.

* * *

Appreciates Canadian Hardwoods

Editor Canada Lumberman:— Philadelphia, Pa.

We are glad to advise you that we have found, in recent months, an increased demand for Canadian hardwoods, particularly for Canadian birch. Quite a number of our customers, after they have received sample shipments of Canadian birch, seem to appreciate the texture and appearance of it, and we find some of them are inclined to specify Canadian birch when ordering additional stock. At the present there seems to be a very fair demand for the class of hardwoods that are produced in Canada, and we are having very good satisfaction with the shipments from the Canadian territory. The manufacturers of Canadian hardwoods, in our judgment, need only to take care to see that the stock is properly manufactured and properly graded in order that they may continue to receive business for the products from the States. —Wistar, Underhill & Nixon.

* * *

River Drivers Have Been Scarce

Editor Canada Lumberman:— Bracebridge, Ont., May 8th.

The drives in this district are now all under way although some of them were held up on the start owing to extra high water. However, this surplus water is now pretty well run off and the logs are on their way to the mills, and under ordinary circumstances should reach their destination in good time. We understand that in some districts the scarcity of river drivers is going to have a very serious effect on the outcome of some drives, but as for ourselves, we can get what men we require at from $10 to $15 per month of a raise over what we paid last season.

The output of logs during the past season in our vicinity will about equal

that of last year. There seems to be considerable lumber moving just now and the demand for this season's cut is fairly good.—J. D. Shier Lumber Company, Limited.

* * *

Lumber Trade Brisk

Editor Canada Lumberman:— Owen Sound, Ont.

The large quantity of snow on the ground at the end of March, and almost continuous rains during April, were expected to furnish plenty of water to bring out all the early drives. The greatest difficulty will be destruction of dams owing to such an abundance of water. Market conditions are much better than a year ago and trade is quite brisk at present.—John Harrison & Sons Company, Limited.

* * *

Labor Supply Scarce on Georgian Bay

Editor Canada Lumberman:— Byng Inlet, Ont., May 1st.

Our driving operations have just started and promise reasonably for a good season. We have, if anything, more water than is needed at present. There will be some delay where storage dams have gone out on account of high water, but this is incidental and occasional.

We are not able to state definitely as to the comparison of the log output of this year with last year's, but are under the impression that there will not be much difference between the two years.

The probabilities are that labor conditions will affect the sawing capacity this season.—Graves Bigwood & Company.

* * *

American Market Very Strong

Editor Canada Lumberman:— Pembroke, Ont.

Driving conditions are excellent in this district. Water is plentiful, and there are sufficient drivers on hand for the work. The output of logs in this district has been approximately the same as for the season of 1914-15.

In regard to market conditions, the tone of the Canadian market seems to be improving, and the American market is especially brilliant at this time for mill culls, box and common lumber. There is also a fair percentage of good lumber moving to the American side, which we presume is being used for pattern stock.—The Pembroke Lumber Company.

* * *

Stocks Well Cleared Up

Editor Canada Lumberman:— Clyde Forks, Ont., May 2nd.

Driving conditions in this district are good this year, the water keeping high. There is very little driving to be done as nothing of any account was taken out during the winter. With regard to trade conditions, we find them fair at present, but prices are not up to much. Our stock has been pretty well cleared up during the last two months.—The Clyde Forks Lumber Company.

* * *

Editor Canada Lumberman:— Chapleau, Ont.

Driving conditions could not be very much better than they have been this spring, with plenty of water and the ice going out nicely.—Austin & Nicholson.

What Are Canadian "Good Sides"

Editor Canada Lumberman:— Toronto, May 10.

In the Canada Lumberman of May 1st, on page 38, an article appeared under the heading of "Query and Comment," referring to the grade known as Canadian "good sides." The definition given by your informant does not agree with my own experience, and I would like to draw your attention to what it seems to me should be included in Canadian "good sides." In order to make the matter clear I will repeat the questions asked in your May 1st issue, by one of your readers, and then will give my reply. The questions were as follows:—

1. Will "Good Sides" allow No. 1 Dressing boards. If so, what percentage?
2. Will this grade allow No. 1 Cuts, if so what percentage?
3. Will this grade allow No. 2 Cuts, if so what percentage?
4. Will this grade allow Shaky Clear, if so what percentage?
5. What is the narrowest width that 4/4 "Good Sides" will allow?
6. What is the narrowest width that 5/4, 6/4 and 8/4 will allow?
7. In a representative grade of "Good Sides" what percentage of the stock would consist of Fine common, Selects and Uppers?

My replies to the above questions would be as follows:—

1. No.
2. This grade will allow of small red knotted stock that might be graded as No. 1 cuts, but coarse knotted and black knotted cuts are not permissible.
3. No.
4. No, but it will allow what is usually termed fine shake stock.

5 and 6. Eight-inch in all thicknesses.

7. According to American grading, "good sides" will consist of red knotted No. 1 cuts, all clear stock, with coarse fine shake, fine common, selects and uppers.

I may not be absolutely right in my interpretation of this grade and I would like to have other readers put me right if they think differently.—Toronto Wholesaler.

In the Public Eye

A budget of comment presented in the interest of public welfare, independent of party politics and with malice toward no one.

So many pages of reports about the fuse investigation at Ottawa have been published by the daily press that most of us have had a hard time getting at the bottom of the thing, particularly when we found that whatever newspaper we read served the thing up to us with a strong party flavoring. During the last few days when some of the real parties to the contracts have been in the witness box, a good deal of definite information has been brought out, showing that there was ground for the suspicions held by the public about the way in which the contracts were handled. During the first few days of the investigation, however, and even up to the present, I have not been able to get rid of an idea that the whole thing is being staged and that the effect of the proceedings upon the public mind is being considered far more definitely than the importance of unearthing any irregularities that may have been going on before the investigation commenced. I am still in doubt whether the investigation is being conducted in the direct interests of those who are most concerned in having the facts made public, or whether its chief objects are to look after the interests of some other people.

The Canadian manufacturer is the man who has most at stake in this business, and don't you think that, both as a tenderer for contracts and as a witness before the Commission, a Canadian manufacturer has been given a pretty raw deal? After the way in which Mr. Lloyd Harris states that he was treated by the Shell Committee, being turned down and discouraged when seeking contracts, and being advised to see Col. J. Wesley Allison, I was expecting to see him handled rather sympathetically by the members of the Commission. What do you think the Commission has been appointed for? Is the object to find out whether contracts have been improperly let and whether Canadian manufacturers have been passed over in favor of United States manufacturers?

There must be a lot of Canadians who felt hot under the collar when they read the report of the manner in which Commissioner Meredith handled Mr. Lloyd Harris, when the latter was giving evidence to the effect that Col. Carnegie told him to see Allison about fuse contracts.

"How in the world can you square your evidence that he (Col. Carnegie) dishonestly prevented you from getting a contract with the statement that he is an honorable man," asked Commissioner Meredith of Mr. Lloyd Harris. "The only thing I could think of was that influences had been brought to bear" was Mr. Harris' reply.

"To force an honorable man to do a dishonorable act, do you think that is comprehensible?" "It does not seem so, but it is the only way I can explain it."

"Then your theory is that Col. Carnegie was honest, but was forced to do something against his better judgment?" "Yes."

Sir Wm. Meredith: "Let us call a spade a spade. If you thought that, did you not think you had a high public duty to bring it out?" "I did, I went to the Prime Minister."

"Why did you not bring it out publicly?" "Because I would not take the responsibility of bringing it up while the war was on."

"Was the secret this, you were looking for a contract?" "No, it was not."

Is this the kind of treatment that a Commissioner appointed by the Government is expected to hand out to a reputable Canadian? The only thing I regret is that Mr. Harris was calm enough not to give back as much as he got. However, the whole affair looks so much as if it is in the hands of a stage manager, that it would probably have done no good even if Mr. Lloyd Harris had got off a little indignation when it was insinuated that motives of business cunning prompted his course, rather than motives of patriotism. Commissioner Meredith, moreover, is the same man who a few days previous had taken upon himself to read a lecture upon politeness to Mr. E. F. B. Johnston, who represents the interests of the public.

There is a definite contradiction between Col. Carnegie's evidence and that of Mr. Lloyd Harris. Col. Carnegie said that he had not referred Mr. Lloyd Harris to Col. Allison. In view of the direct statement of Mr. Lloyd Harris to the contrary, it looks to me as though the evidence upon this point, on which so much depends, will fit in best with Mr. Harris' statement, by the time the investigation has closed. But no matter what may be the fact in this connection, or how different the Commissioner's opinion as to a man's duty to his country may be from yours or mine, a witness of Mr. Harris' standing is entitled to freedom from such treatment as Commissioner Meredith handed out to him. If the findings of the Commission are to have any weight with the people of Canada, the behavior of its members towards respectable witnesses will have to be improved.

Logging Railroads in the East

Conditions That Make Them Profitable or Otherwise—Advantages from Steady Log Supply

Logging by railroad is not carried on in Eastern Canada to anything like the same extent as in Western Canada, but it is in some localities an important feature in connection with logging operations. The chief reason for the installation of a logging railroad in Eastern Canada, as a rule, is the fact that it permits a mill to make a clean cutting of its limits, taking out both the hard and soft woods, and also makes it possible to carry on operations throughout the year, instead of confining them to logging in the winter and sawing in the summer. This feature makes a logging railroad, when other conditions render it feasible, a valuable asset in connection with a sawmill. Not only are the expenses per thousand feet of logging and sawing reduced by the increased output rendered possible, but a manufacturer is also enabled to serve his market much more promptly and satisfactorily. He is able, like the manufacturers in the Southern States, to take out special orders; that is to say, when a certain line of stock is required in a hurry he can send an order to the woods and have the logs cut and shipped into the mill in a very short time. The fact that a mill is thus in a position to turn out practically anything promptly, makes its appeal to the wholesaler and consuming trade far more definite and interesting. However, it is possible by means of a logging railroad, to take out not only the soft woods and the hard woods, but also wood and pulp from tops and from the small trees which are ordinarily left in logging operations.

Roughly speaking these are the chief features in connection with the operation of a logging railroad in Eastern Canada. When one comes to contrast the conditions rendered possible in this manner, with those existing in connection with a plant whose logs are received entirely by water the advantages of the logging railroad are all the more apparent. It must be borne in mind, however, that when speaking of the advantages of a logging railroad, it is not being suggested that this method of logging should supersede the method of log driving by water. It is only under certain definite conditions that the logging railroad in Eastern Canada is feasible, and only in such cases will the advantages which are referred to in this article exist. By way of contrast, take the case of a mill which receives its logs by a water route. In most cases, in practically all cases in fact, these logs will be soft woods only. Such hardwoods as are received in these mills have to be hauled to the mill on sleighs, or in some cases they are specially wired up to soft wood logs for the water drive. Unless the hardwood logs are thus secured, the proposition resolves itself into one of taking a portable mill to the logs or leaving the hard woods standing. The portable mill proposition, of course, is an extra one standing upon its own basis as a matter of expense, so that to all intents and purposes, unless the hardwood logs are brought in by railroad, the soft wood logs have to bear the whole burden of operating expenses. In the matter of cost of operation it must be remembered that large operators who drive their logs by water are obliged to keep sufficient logs cut ahead, for from one to three years in advance, in order to make sure that they will have sufficient stock for the annual output of their mill. Thus they continually have a large investment lying practically idle, upon which they will realize nothing for some years. When a logging railroad is operated, this source of operating expense is greatly reduced. At the most, it is necessary only to keep one year's output ahead, and in some cases logs are hauled to the mill as fast as they are cut in the woods and the outlay invested in logs is never extensive. Under these conditions the operator is able to realize on his investment much more quickly.

A Stimulus To Economical Sawing

An important point in connection with operations carried on by means of a railroad is the efficiency that can be developed in connection with securing the utmost possible in the way of good stock from each log. It is possible, and is a frequent practice, to ship the trees from the woods to the mill pond in their full length, so that they can be cut into separate logs at the mill pond to the best advantage for filling such orders as are on hand. This enables the manufacturer to obtain a better price for the product of his logs than if they were cut into shorter logs in the woods.

In considering the advantages of railroad logging one must also bear in mind the fact that in connection with river drives, especially on narrow, awkward streams, one is certain to lose a definite percentage of hardwood logs that sink, either when they become waterlogged, or when they break away from the soft woods to which they are wired. It is also almost impossible to drive long logs in narrow streams, as they block the streams and sometimes cause a great deal of trouble and expense by starting a jam. All of these difficulties are avoided by the operation of a logging railroad.

In Eastern Canada the construction of a logging railroad may vary considerably in cost, according to the nature of the country. For instance, the grading of the roadbed will cost anything from $500 per mile under the most favorable conditions, to about $2,000 per mile in mountainous country. Probably an average cost would be about $1,700 per mile. This cost should provide a standard roadbed, but the grades and cuts, of course, would not be standard. A logging railroad is generally built for the sole purpose of handling logs with as little expense as possible, and it is therefore not necessary to go in for such guarantees of efficiency as are necessary in connection with a railroad for ordinary traffic. The cost of railroad ties, for instance, is likely to be very small, comparatively speaking, in connection with a logging road. As a rule the ties can be made along side of the roadbed. The average cost per tie laid down on the roadbed is probably in the neighborhood of 12 cents each. The comparative shortness of a logging railroad, in contrast with a regular railroad, also makes it possible to effect considerable economies in the cost of rails. Sometimes these can be rented. Even if they have to be bought outright, it is generally possible to purchase second-hand rails which suit the requirements fully. The weight of the rail will, of course, depend entirely upon the weight of the locomotives which are to be operated upon the road.

Equipment of a Logging Railroad

In the matter of equipment, much will depend upon the grade of the road. Where steep grades are encountered the general practice is to use a geared type of locomotive. Geared locomotives are not built for speed. Their chief characteristic is their capability of handling heavy logs on very steep grades. The cost of a geared locomotive will vary according to its weight, and will be anywhere from $6,000 to $12,000. For shipping the logs the practice is to use either flat or logging cars. The flat cars are best suited for hauling long logs, but the logging cars are the best for short logs. The cost of cars will vary from $400 to $800 each; the higher price being for steel cars. An important piece of equipment in connection with a logging railroad is the steam loader for lifting the logs from the ground to the cars. Steam loaders are of many types and they vary greatly in price. With a crew of three men they are capable of handling about one thousand logs per day, which makes the average cost of the handling per thousand feet comparatively small.

The above points are the principal ones to be taken into consideration when one is considering whether or not to install a logging railroad. There are, of course, other very definite factors which will come into play. For instance, before one even considers this method of logging it will be necessary to estimate the amount of timber that can be cut per square mile. The larger the cut per mile, the less will be the cost per thousand feet. Taking into consideration the points that have been briefly outlined, one may easily see that logging by railroad, wherever it is economically feasible, is the most up-to-date and practical method at present known of conveying logs from the woods to the mill, and that it is the most economical under its special conditions. When it is also borne in mind that it makes it possible to keep a sawmill operating throughout the year, to eliminate a large layout of logs and to handle special orders promptly, it becomes apparent that the possibility of operating by railroad ought to be very thoroughly investigated in connection with any lumbering business in Eastern Canada. The instances in which it will be found to work out advantageously may not be numerous, but in the cases in which they are feasible their benefits are so important as to warrant a considerable expense in their installation.

That the operation of a logging railroad in Eastern Canada is not looked upon by all lumbermen in exactly the same light becomes

The log loader at work.

A loaded train of logging cars.

quite evident when one makes enquiry of those who are already conducting their operations in this manner. We recently had reason to make fairly extensive enquiry among those who are conducting logging railroads in Ontario and Quebec. The reports we received showed that some firms were meeting with much success while others were finding the difficulties in connection with this work so great as to discourage them. The point which this difference of opinion emphasizes is that one cannot make too careful a study of the conditions involved in connection with a given operation, before deciding to install a logging railroad.

In this connection, it is interesting to note that a prominent operator in the province of Quebec reports that, generally speaking, where there are drivable streams, railroad logging should not be considered. In railroad operation, he says, cars have to be loaded either by team or steam, and in order to keep a mill of 75,000 feet per ten hour day capacity in operation it will be necessary to have two locomotives, if the length of line is anything up to about 25 miles.

The same operator discussing the question of fuel, states that the chief consideration under this heading is the fire risk, and the solution of the matter must depend entirely upon the condition of the right of way. If one were considering "Safety First" he would use fuel oil, the next best fuel from this point of view would be coal, and the next, wood. If one were considering only the cost, the best fuel would be wood, the second best coal, and the third best oil.

The same operator gives a good piece of advice in regard to employees. Locomotive drivers, firemen and brakemen, he says, are a very important factor in logging by railroad. Incompetent men who neglect the boilers cause deterioration in the fire box and the tubes. Moreover, they have a similar effect upon the machinery of the locomotive and are a source of great expense.

Referring to track construction this operator reports that the track should be made as nearly standard as possible. A cheaply laid track, according to his view, is a source of heavy and continual expense for up-keep and results in excessive wear and tear of machinery, to say nothing of being a prolific source of expense. Roughly speaking, he estimates that $5,000 per mile should be the cost of clearing, grading, ties, and tie and rail laying, to this it would be necessary to add the current cost of rails. A further item of equipment that would be necessary in districts where there is a considerable snowfall is a wing plough, also a flanger. Sometimes, even with the best possible equipment, it is a very difficult undertaking to keep the road operating in winter.

This operator's conclusion, which he has reached after conducting logging operations with almost every kind of equipment, both in the east and on the Pacific Coast is interesting. He says that he has no hesitation in advising that logging by rail "is the court of last resort in the east."

We would like other readers of the Canada Lumberman, who have had experience with logging railroads, send us their views in connection with this subject.

Logging by Rail—Few Pointers

Good Roadbed and Skilled Operators Essential—The Log Loader's Importance

By R. S. P. Smyth*

On the Pacific Coast, 25 years ago, most of the lumbermen were getting their logs to the rafting ground with oxen, but they were skinning along the shore, generally going a mile or so back, using skid-roads, and bringing their logs in "trains," that is, one dogged to the other, greasing the notch in the skids on the levels and sanding it on the down grades. Those were the days when the bull-puncher was king and the best paid man in the camp. The lumberman was making money under these conditions. Then came the donkey engines, roaders and yarders—and these are largely used even today. However, there was timber beyond the reach of the roader and yarder, so the locomotive and rail came in. As the years go by there will be more locomotives and longer rails, and fewer roaders, but the yarder has to be used to feed the locomotive business.

In the east, the nature of the timber and the circumstances of

* Canadian manager for Finch, Pruyn & Co., Gouraud, P.Q., and Glens Falls, N.Y.

Logging locomotive used by Finch, Pruyn & Co., Inc., Gouraud, P.Q.

An expensive bit of trestling.

the logging operations have made logging methods a very different proposition from that of the Pacific coast. In eastern Canada, horses have been and still are the mainstay of the logging camp, hauling the logs from the stump to the stream. In the spring, when the freshets come, the logs are driven to the mill with the help of the reckless, hard-working, hard-living river drivers.

Railways as logging propositions direct from the woods to the mill have not found many locations in eastern Canada. There is good reason for this, because, generally, logs can be hauled much cheaper by horse and rail. In localities where there is an abundance of hardwood, with a long distance haul, the rail is a necessity, but it comes high.

The roadbed of a logging railroad is one of its most important elements. If a good grade of rail is used and good ties, the initial cost will be high, but if a cheap grade of rail and cheap ties are used, the up-keep bill on road and machinery will be heavy all the time, to say nothing of the cost of accidents which are certain to result. Even with good roadbed, accidents will occur. A solid roadbed with good ties and fairly heavy rail, eliminating as far as possible all heavy grades and curves, makes the cheapest road if it is to be used for several years. The right-of-way should be cleared at least thirty feet, and all slash should be burned clean. Where wood, coal or oil is being used as fuel there is always danger of fire, and naturally more danger where the slash lies along the right-of-way.

Where easy grades and few curves can be made, the switching type of engine is probably the best, but where heavy grades and curves cannot be avoided, a good geared type of locomotive will be best. From forty to sixty tons seems to be about the size of locomotive that finds most favor.

Only one kind of engineer is good for the logging business, and that is the best. The engineer has practically all the responsibility of keeping his engine and boiler in shape. There is no roundhouse equipment, as with a traffic road, and all depends on how much care the engineer gives to his engine. In fact, the skill of the engineer will have a great deal to do with the cost of up-keep.

Bearing in mind the usual length of log made in eastern Canada, the 34-foot car is preferable to the shorter logging car. There are two trucks to keep in order in any case. Cars must be rigged with tumbling stakes on one side at least. With the 34-foot car, the log loader that travels over the car is the best type. Fixed rails can be laid over the cars for the log loader, thus saving considerable time in shifting, as compared with shifting rail sections. In any case the car without platform is best, as it does not accumulate snow and bark.

The log operator is a very important man in connection with railroad logging operations. He must know how to handle his machinery, so as to get the best out of it. He must always be quick and cool, and have eyes in the back of his head to prevent accidents to men and machinery. It pays to get the best man for this job, no matter what his price may be.

A Douglas fir timber of such immense strength that it broke the testing machine at Oregon Agricultural College, Corvallis, Ore., is mentioned in a report recently made by Mr. O. P. M. Goss, consulting engineer of the West Coast Lumbermen's Association. The machine gave way and its base broke squarely off at a point indicating a pressure of 67,000 pounds. The timber did not show the slightest indication of failure although its load, figured on the basis of the modulus of rupture, was in excess of 6,630 pounds to the square inch. While this is not a record of strength for a Douglas fir timber, it is causing considerable speculation among engineers familiar with the circumstances.

Trois Pistoles Pulp and Lumber Co., Trois Pistoles, P. Q.—View of Upper Mill.

Improvements at Trois Pistoles

New Equipment Adds to Output of Two Mills Operated by Progressive Company

The Trois Pistoles Pulp & Lumber Company, Riviere Trois Pistoles, P. Q., have recently made many improvements to their saw mills, which are now in operation and are among the finest and most efficient in the province of Quebec.

The limits are located on the Riviere Trois Pistoles and its tributaries, and are from 12 to 35 miles from the town. The yearly output of the plant is about 20,000,000 feet of spruce lumber, cedar shingles and lath, and 1,000 cords of pulpwood, the product being disposed of in the United States and Canadian markets. The company also turn out a quantity of railroad ties. Employment is given to about 250 men in the mill, 350 on the drives and 1,500 in the bush operations.

The equipment of the company's upper mill includes a Waterous band saw; Long circular and gang; 7 Dunbar shingle machines, made by the Smith Foundry Company, of Fredericton, N. B.; 5 Waterous rossing machines, for rossing pulpwood, and one for barking; Waterous edger and cedar cut-off band mill. The new capacity of this mill is 40,000 feet of spruce lumber per day, 130,000 shingles, 25,000 lath and 30,000 cords of pulpwood.

The equipment of the lower mill includes a Waterous circular; Kendall circular gang, supplied by the Waterous Engine Works Company, Limited; Waterous lath machine and edger; 10 Dunbar shingle machines, furnished by the Smith Foundry Company of Fredericton, N. B.; one Waterous cedar barker; two Waterous pulpwood barkers; one Sherbrooke Iron Works barker; one Sherbrooke Iron Works cedar cut-off saw; 350 h.p. boilers and engines and a Westinghouse H plant supplying electric light to the whole system. The present capacity of this mill is 60,000 feet of spruce lumber per day, 180,000 shingles, 18 cords of pulpwood and 25,000 lath.

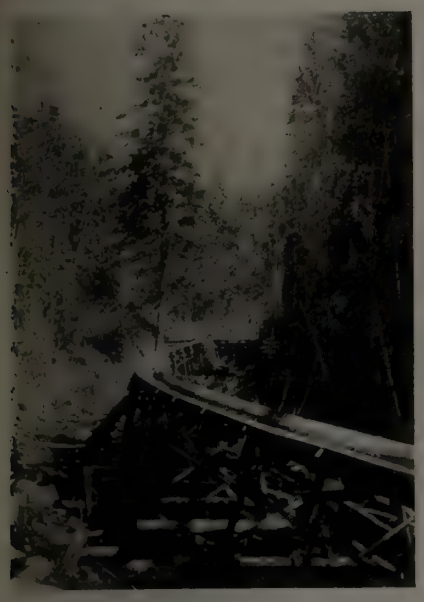
British Columbia Logging Along the C.P.R.

Conditions Prevailing and Methods in Use in Coast and Mountain Districts Described by One of the Railway Company's Staff



Water Flume Used in B. C. Logging

It has been said "The timber of British Columbia is to that province what the wheat is to the prairie provinces." Both are products of the soil, and as long as the soil fertility is conserved the crop is assured.

In British Columbia, standing timber is the one ready source of revenue to the pioneering farmer, who makes a home for himself out of the forested regions. The sale of forest products obtained, such as cedar telegraph poles, saw logs, ties, fence posts, shingle bolts, cordwood, etc., provides the homesteader with a working capital which eventually puts him on his feet, and spans over the lean years of development and soil preparation.

In the last analysis the harvesting and production of wood in British Columbia is the greatest and most permanent industry of that province. Every mine has a measurable existence, but so long as Nature provides the mineral and vegetable soil, great forests will clothe the hills and valleys of the west slope of the Rockies.

There is in British Columbia to-day a capital resource of four hundred billion feet of merchantable timber. At the present rate of cutting this would last over 200 years. The interest, or increment, maturing every year is five billion feet—more than enough to supply the needs of all Canada. The wood wealth of British Columbia is believed to be twenty times that of Alberta, Saskatchewan and Manitoba.

As British Columbia looks to the three great provinces of central Canada for their foodstuffs, so must these provinces look eventually, and for all time, to the Pacific province to supply them with wood to build their houses, barns, granaries, piggeries, etc.

And why should not that same sentiment which prompts Canada to support the Empire with her men and money, stimulate those who remain at home to carry on business as usual, to economize, conserve and utilize the nation's natural timber resources so that the forests of Canada can play their part in making prosperity, and so build up the Empire.

In order to serve the needs of the natural market (the prairies), there has been invested in British Columbia three billion dollars in timber holdings, logging plants and sawmills. These plants, under normal conditions, distribute per year nearly $30,000,000 in wages; $16,000,000 in transportation, and $6,000,000 in supplies. The paramount position of this forest industry cannot be stated too often, nor in too strong terms. It opens up new districts, brings employment, transportation, cleans the land, furnishes the markets for the settler, and brings into the country the wealth upon which other industries are supported.

The Government of British Columbia, under the leadership of Sir Richard McBride, in 1912 inaugurated a most efficient forest administration which is responsible for the perpetuation and protection of the forest resources. The fire prevention problem has now been practically solved. The inventory of the timber areas is well under way and permanent plans are now in formation for the production of perpetual timber crops for future generations.

Loading Platform for Railway Ties

The Canadian Pacific Railway, as a private corporation, is the pioneer in this movement, and the company has demonstrated its sincerity and interest in the future of British Columbia by putting under forest management nearly 600,000 acres of timberland. The greater number of the 395 sawmills in British Columbia are located on the C. P. R. and no doubt the importance of establishing the lumber industry on a permanent basis led this great public utility to take active and concrete steps along the lines of forestry practice. This was emphasized by the fact that the largest percentage of merchantable timber in the province is on and tributary to it. The C. P. R. for many years have confined the purchase of their immense timber requirements in the west to producers in British Columbia and the west, and this policy of buying at home is now in force all over the system.

The every-day problem occurring in the exploitation of the great timber resources of British Columbia cannot be appreciated by the average buyer of lumber who draws up to the lumber yard and calmly and easily loads his wagon, but to those engaged in getting the logs from the forest to the mill, it is serious battle with the forces of nature. No two operations present the same difficulties, and for that reason many different principles are in use, from the flying machine on the coast to the one horse sloop back in the mountains.

The history of lumbering in British Columbia is an interesting one, and it is unfortunate that much of its early history is not available to the public.

There are two main fields of action which have developed more or less independently of each other:—

Pole Storage and Grading Yard on the C. P. R. in British Columbia.

Typical Log Contractor's Camp in British Columbia

(1) The Coast Zone of the Pacific Coast, not more than fifty miles deep, and west of the Coast Mountain Range. This is the region of the Great Douglas Fir and gigantic Cedar.

(2) All of the Interior of B. C. east of the Coast Ranges, and west of the Main Rockies. The forest of this region is a mixed one, depending for composition on the rainfall and elevation. The principal lumber species are Douglas fir, Western soft pine, spruce, larch and cedar.

Coast Zone of the Pacific Slope

The lumber industry had its beginning in this region in 1827-28, when Dr. McLaughlin, Chief Factor of the Hudson's Bay Company, erected and operated the first sawmill at Vancouver, Washington.

In the early days, oxen and horses were the means of transportation, but this method was far too slow and as the timber became removed from tidewater, more efficient and expeditious methods became necessary. The attention of the resourceful pioneers in the logging business was soon directed to steam, and to within the last three or four years this power was almost exclusively used. As the industry was a large and active one in the Puget Sound region years before our own Pacific Coast was tapped by the C. P. R., the methods in use there were then adopted en bloc by our own operators. This was indeed fortunate, for many years of experiment and failure were necessary before the use of steam mechanical devices were economical. The universal steam power machinery used to handle the gigantic sticks is the steam donkey in connection with hoisting drums. After the trees have been felled, swamped, and bucked, the logs are yarded by cable to the actual loading point, often a railroad, and loaded on cars, thence by rail to the mill or water.

The method of donkey skidding held supreme until the advent of overhead logging about seven years ago. The principle is the use of an overhead cableway stretched between a tail tree at some distance out from the track, and a head spar tree located at the donkey which is equipped with drums, etc., at the loading point on the track. On the main cable runs a carriage consisting of a double travelling block and supplied with loading lines, tongues or chokers. The carriage is played rapidly to and fro between tail tree and head spar tree by the skidding rope and the outhaul rope. The skidding rope is fed out, the log tongued or grabbed, and pulled in rapidly to the loading point, where it is loaded on the cars. The cost of this method is one-third less than donkey logging.

The tremendous advantage of steam apparatus is very apparent when one considers that 40,000 to 50,000 feet skidded per day is the average for a modern aerial logging rig, as compared with 10,000 to 15,000 for a horse camp. There are many modifications of the system, but the overhead principle is the same.

When timber was plentiful immediately on tidewater "hand logging" operations were common in British Columbia. The crudest bull work methods were used. Elbow grease and gravity were the only forces in operation. However, these methods are practically gone today, and the steam skidding donkey and the aerial cableway system are largely in use. The application of electricity will eventually, no doubt, become important.

To transport the logs to tidewater standard gauge railroads are generally in use. Geared locomotives haul out the logs, on especially constructed cars equipped with standard appliances, to the log dump pier on the water. A steam operated trip line unloads the cars in quick order.

In this region with the possibility of reaching any or all of the mills established on tidewater, a definite log-market is available at all times of the year.

There are many independent operators who cut and sell their logs in the open market, or contract their cut to the sawmills. However, many of the lumber manufacturers operate their camps.

Owing to the ravages of the toredo (marine boring worm), large reserves of logs are not created, and as a usual thing, the cutting follows closely the supply and demand.

Conditions in the logging industry at the Coast have become largely standardized in the past few years. However, owing to the diversity of conditions in interior British Columbia the same is not true.

Interior British Columbia Logging Methods

In this region the industry is largely centred on the main line and branches of the Canadian Pacific Railway, although with the opening of the other two transcontinentals some plants are now being established in the north.

Practically all the operators conduct their own logging operations. All of the work, from making the roads, felling the trees, transporting to the mill, manufacturing and loading onto cars, is done by the lumber company. However, a few of the lumber companies have found that it is more economical to contract the felling, skidding and watering. Small jobs ranging from 100,000 feet to 6,000,000 feet, are contracted for to responsible jobbers who work themselves. The more successful tenderers are, as a rule, of Scandinavian origin. They are very reliable, hardy and resourceful.

The influence of Eastern Canadian methods is more marked in this region, owing, no doubt, to the more frequent and easier travel east and west than north and south. Possibly the closer approximation in the size of the timber has had something to do with this also. However, the difference is nevertheless broad and is largely of a progressive character in favor of the west.

Summer logging is customary and this means a smaller circle between outlay and return.

The ruggedness of the topography has necessitated the adoption of dry and water chutes. The dry chute is generally used where the grade, combined with the use of a lubricant, is sufficient to move the logs, ties, or poles to the desired terminus, preferably a pond or river. The chute is constructed of three or four logs bevelled smooth and bedded on the necessary sills. Any grade can be negotiated by this means.

In some instances chutes made of logs are fitted to hold water (the Swedes are adept in constructing this type), and the products floated down to their destination. Cost of such chutes is from 20 cents to 40 cents per foot.

Water flumes are used in some instances where a large body of timber is to be moved. They are constructed of two ply boards and usually of the V type. The cost is from $2,000 to $5,000 per mile.

As in the east, wherever possible, advantage is taken of water transportation in getting the logs to the mill. However, driving and holding logs in storage in the Mountain rivers is attended with periodical losses caused by sudden floods, the breaking of booms, and the dispersion of the timber.

In the development of piers for storage purposes, silt has to be reckoned with, and repeated dredging is necessary to keep the area clean.

Railroad Transportation

Railroad logging has many advantages, particularly when the question of tying up a large capital in logs and other raw wood products is considered. The initial outlay is rather large, particularly in rolling stock, rails and ties. Geared locomotives are used and 30 to 50 pound steel. The cost varies from $1,500 to $5,000 per mile, dependent, of course, on the ground. In winter logging, where the snowfall permits, the methods used coincide largely with those in vogue in Ontario. However, the erratic temperature conditions do not allow the refinement of iced roads, and snow roads are the rule. Logging costs in winter logging range from $5.50 to $8.50 per thousand landed at water; summer logging, landed at water, $3.50 to $8.00.

Eastern Canada Pulpwood Trade

*An Outline of Its Recent History—Growth of the Pulp and Paper End—The Settler's Mistakes**

One of the economic problems that has never been satisfactorily settled is that of the regulation of the pulpwood traffic. Apparently government executives have never been of the same mind on this subject, as legislation regarding it has been variable.

In the early history of paper making in Canada, about 1895, around the time of the formation of the now justly famous Laurentide Paper Company, some of the large paper companies in the United States purchased extensive timber limits in Canada, principally in Quebec, and their purchases represented most of the available timber limits at that time. It is creditable to provincial governments that, with one exception, the writer knows of no limits sold to speculators—and in that instance the purchasers had all the earmarks of legitimate operators. The purpose of these purchases was undoubtedly to keep the American mills of the purchasers amply supplied with wood when their home supply was exhausted, or to assist in conserving their limits in the United States.

The idea was that at an opportune time these limits would be operated on, and the wood in its manufactured state would be taken by boat or rail to the American mill, where there was plenty of power. The American manufacturers had in mind further extensions to their plants and to build new plants in the United States, bringing the wood from Canada.

It was not believed that Canadian mills for the manufacture of pulp and paper could be operated economically enough to compete with American mills. After several mills had been in operation a few years, it soon became evident that paper and pulp could be manufactured in Canada economically enough to compete with American mills, in spite of the duty. It also became evident to many who were posted, that water power in the Eastern States at least, was becoming more erratic and less each year, due to the diminishing forests. We

* Specially contributed by a man of long experience in the Canadian Pulp and Paper Industry.

are all familiar with the conservation movement in the Eastern States during the past few years as a result of this diminution.

Beginning of the Period of Expansion

When it was realized that there was not an unlimited supply of wood available in the United States many of the mills which did not possess large timber limits, or had no limits, began to buy pulpwood in Canada. This was a few years prior to 1900. Before that time, a fair amount of wood had been purchased in Canada, but an industry in this commodity sprang up around 1900 and in succeeding years that was quite surprising, even considering the above conditions.

Buyers came over from the United States and placed contracts with farmers and settlers for wood, which would be cut from standing timber on their farms; and with jobbers and contractors, to be cut from Crown lands, or limits that they owned or were interested in. It was not long before the trade was fully organized, with accredited Canadian pulpwood agents who bought from the settlers and jobbers and sold to the American mills.

Naturally this was followed by considerable agitation to prohibit the exportation of pulpwood, in view of the fact that there was a duty of about $6 a ton on paper and $2 on pulp, which operated against the Canadian manufacturer of the finished article, while at the same time the American manufacturer was buying his wood in Canada as low as the Canadian mill could purchase. The lower freight on the pulpwood, as against a higher freight on paper and pulp practically nullified any difference in waste in the wood, especially as a quantity of the wood was booked at still lower rates, whereas the nature of manufactured pulp and paper made that practically impossible.

The agitation did not last long in Ontario, for on January 13th, 1900, an order in council was passed which prohibited the exportation of spruce and other wood suitable for pulp, cut from Crown lands. It was not, however, until April 26, 1910, that Quebec passed a similar order in council. It was a more difficult question to deal with in Quebec as there was a far greater sale of pulpwood than in Ontario due principally to sellers being nearer the actual selling mills buying, but also to the fact that Quebec settlers and farmers had more timber for sale on nearby districts than had Ontario. New Brunswick passed similar legislation on April 26, 1911, a year later, but Nova Scotia and British Columbia have not followed suit.

Results of Prohibition of Export

The result of Quebec's prohibition was that the exportation of her wood decreased 13 per cent. of her total production. It should be explained that these prohibitions affected Crown lands only, but did not affect the so-called private lands, which are lands sold out to farmers or grants, as in Quebec, to the old Seigneurs, and in Ontario to the South African veterans. Due to the fact that Ontario prohibited exportation of wood in 1900 practically all the wood was purchased for the following ten years in Quebec and Nova Scotia, but principally Quebec.

In August, 1912, the United States repealed the tariff on newsprint and pulp, allowing both articles to enter free. This relieved the tension concerning the pulpwood question considerably, especially as it was apparent then that the continued depletion of the United States forests and the shortage of power made it inevitable that Canada would be the paper and pulp producer of the future, so far as this continent was concerned, at any rate.

Americans Want Free Wood

American manufacturers have consistently combatted the idea of prohibition of wood, and it is understood that representation was made by the United States that in view of the withdrawal of duty on pulp and paper there should be no prohibition of wood export. Only a few weeks ago the president of a large American company, who owns 3,000,000 acres of woodland in Canada, is reported to have said: "The building of news mills in the United States has ceased. Canadian mills are being ertcted at short intervals; and at the present time Canada is shipping into this country approximately 1,000 tons of newspaper per day. Justice and sound economic principles would seem to demand that Congress require the free admission of wood into the United States as a condition to the free entry of the Canadian manufactured product."

The Ontario prohibition was suspended for the year 1914, the Government issuing the statement that this suspension was necessary due to a severe windstorm that had blown down large quantities of pulpwood that would otherwise be lost. That suspension was continued in 1915 and is still in effect.

In 1915, Quebec also temporarily removed her prohibition, stating that it was to provide employment for her settlers during the war. Both provinces, however, are committed to a development policy, and are bound to assist their settlers in new territory by permitting them to export the wood on their lands. No reasonable criticism can be offered to such action in view of the undoubted aid that the new settler requires. Nevertheless, it is interesting to note by the following statistics just what the prohibition of wood meant to Canada.

Statistics of Recent Years' Consumption

The cords used are taken from government statistics and represent the wood actually used in Canada.

1910	598,487	$8,977,305	$21,545,532
1911	672,788	10,091,820	24,220,368
1912	866,042	12,990,630	31,177,512
1913	1,109,034	16,635,510	39,925,224
1914	1,224,376	18,365,640	44,077,536
Increase over 1910, ...	625,889	$9,388,335	$23,532,004
or 105 per cent.			

In 1914 we exported more wood pulp made in Canada from pulpwood than in previous years; nevertheless, the quantity of pulpwood was only one-third, which means that the remaining two-thirds was manufactured into newsprint. Of the one-third pulp, one-fourth was chemical pulp, taking a higher value than ground wood; therefore, our figures for 1914 are now as follows:—

1/3 of $18,365,640	$6,121,880
3/4 of above being ground wood	4,591,410
1/4 of above being sulphite	3,060,940
2/3 of 44,077,536 sulphite	29,385,624
	$37,037,374

This total of $37,000,000 represents the value to Canada at the mill and does not include freight.

If you will refer to the figures above you will note that 1,224,376 cords in 1914 were used in Canada in manufacturing pulp and paper. In addition to that we exported 972,508 cords, for which we only received approximately $6,680,000, whereas had it been manufactured into ground wood pulp it would have been worth $14,587,620. If all had been manufactured into pulp it would have been worth about $35,000,000, an increase over what we received for it of just $28,300,000.

Pulpwood is usually purchased by American mills through an accredited pulpwood dealer. Settlers or jobbers are always safer in dealing with regular accredited dealers than with an unknown person, who professes to have contracts to place.

The Position of the Settler

The Northern Ontario settler suffered unnecessary misfortune for this reason during the winter of 1914-15, as, when the prohibition was taken off, a number of speculators rushed in and made contracts with settlers. When the settler had his wood ready the speculator had vanished because he had discovered he could not place the wood he had contracted for, or else he had permitted the settler to cut wood that was unsatisfactory to the final buyer. Settlers, jobbers, or contractors can always secure a list of actual buyers and also a list of accredited pulpwood dealers from the railroads. The T. &. N. O., G. T. R., C. P. R., are posted on this for Ontario wood, and the Q. & L. St. J., C. N. R., G. T. P., and C. P. R., for Quebec.

The contractor should also have a contract stating specifically how the wood should be cut, exact length, the maximum, diameter, and, most important of all, have it specifically stated what conditions will cause rejection. Never leave anything to be understood, have everything in the contract. The reason for this is that there is a continuous discord between the buyer and seller over rejections, quality, etc. Invariably the final buyer wants to be fair, but he absolutely cannot afford to pay long freight hauls and good prices for wood that is inferior, contains rot, is knotty, undersized, short or long in length, etc. He has his manufacturing conditions to study and cannot afford to accept what he does not buy. The seller, on the other hand, invariably feels that "wood is wood," and does not follow the buyers' specifications or does not understand them.

There is a reasonable profit to be made in pulpwood by the settler if he will only learn to study the requirements of his actual buyer, conform to his contract, and do business with responsible and known buyers, because, in that way he will save himself rejections and loss of measurement, which is the worst source of loss. Pulpwood is spruce only; jackpine, balsam, and some other woods may be used to a certain extent with spruce as pulpwood, but it is not pulpwood, except as may be agreed upon between buyer and seller.

No attempt has been made to discuss this industry in detail by provinces, but it is interesting to note the following figures for 1914 issued by the Department of Customs:

	Production	Consumption	Export
Quebec	1,323,917	636,496	687,421
Ontario	587,494	447,751	139,743
New Brunswick	193,126	49,339	143,787
British Columbia	80,013	80,013	.....
Nova Scotia	12,334	10,777	1,557
Canada	2,196,884	1,224,376	972,508

"Hire and Fire" vs. "Hire and Inspire"

Two Policies in Connection with the Relation of the Employer to the Employee—The Old and the New Methods

By A. M. Johnston

IN these days, when we are turning away from problems of distribution and fixing our thoughts upon that most vital element in production, labor, it may not be altogether profitless to consider some of the principles which govern the organization and management of the working force. In order to do this intelligently we must consider men both individually and in the mass. The psychological attitude of the average man differs radically when acting individually, from his activities in connection with his fellows. A man is steadier, more dependable, more open to the influence of reason when acting individually than when associated with his fellows. He has more balance and poise and is more inclined to see conditions from the standpoint of his employer. The average employee moves in the direction from which the greatest force is exerted; therefore, when the employee is acting individually the strongest force proceeds from his employer and he moves in that direction. When he is acting with his fellows the strongest force proceeds from them and he moves in that direction. In every organization of men there are always certain leaders of stronger than average personality who direct the force which proceeds from the organization. It follows, therefore, that to influence the direction in which this force is to be applied it is only necessary to influence these leaders.

As these leaders, acting in their individual capacity, are controlled by the same general law governing the actions of every other individual, they must be isolated so that the force proceeding from the employer shall not be overcome by the stronger force proceeding from the organization. The term "force" is used here in the sense that reason is one of the strongest forces with which men are endowed. The organizer and manager of men must not overlook the fact that emotion is also a force and takes the place of reason with a vast majority of men. It is emotion which exerts the most powerful influence upon men in the mass and invariably overcomes the force of reason wherever these forces come in conflict; therefore, to influence the leaders of an organization they must be placed in a situation where the influence of emotion can be neutralized and reason exert its full force.

Encourage Confidence Between Employer and Employees

He is but a poor judge of human nature who cannot readily pick out the men who are most influential in his working force, and a poor manager who does not constantly keep in touch with these men, know their activities, understand their weaknesses and stand ready at all times to influence them for the welfare of both the concern and the organization. Periodical meetings and conversations with these men, both individually and collectively, should be held, at which meetings the reciprocal relations of employer and employee should be frankly emphasized. These men will appreciate the confidence reposed in them. Ask their opinions of the proper solution of the different problems with which you are confronted. Encourage them to talk and, if it is necessary to show them where they are wrong, use tact in doing so and explain to them fully the reasons therefor. Never forget that they are men with like passions, emotions, feelings, loves, hates and ambitions as yourself, and, above all, that they exert a tremendous influence on your fortunes. They realize, perhaps vaguely, that their prosperity is bound up in yours, and that your success of failure is a matter of moment to them. Carefully develop this feeling by tactfully leading the talk into the proper channels. Try to have them express this idea in words from time to time. A man cannot keep saying the same thing over and over with the idea of being believed without finally coming to believe what he is saying. If you have the material in you for a successful manager you will find no difficulty along this line.

The importance of the work outlined above cannot be over estimated. The leaders in your shop or mill are constantly in touch with your entire working force, influencing them either for or against you. They are the men who often make or break a manufacturing concern and to neglect the work necessary to secure their goodwill and influence is to turn one of your greatest assets into a liability. When I use the term leaders I do not necessarily mean bosses. To be a leader among the men is quite a different thing from being a foreman or boss. The foremen or bosses are seldom in the confidence of the men, while the leaders are, and therein you will find the real reason for cultivating these men in the manner outlined above.

To handle men successfully a manager should be a good judge of human nature; at least in its general aspects. The first thing he should learn is that all men are not alike. This truth is axiomatic and yet how few of us recognize its important bearing on the organization and management of men? We all admit that men are not all alike, but very few of us take the trouble to ascertain in what particulars they differ from each other. Too many managers adopt cut and dried, rule of thumb methods of handling men. They handle their men as they feel that they should have to be handled themselves. They forget that men are only boys grown tall, and that they still possess many of the characteristics of children and must often be handled as such. One must be encouraged, another driven, and still another coaxed. Some men grow sullen under compulsion, and, while seemingly obedient, are sulking on the job. Some have their hearts broken by the merciless driver; the big-fisted, broad-shouldered, pugnacious-jawed manager. Some have to be driven and look upon every word of encouragement given them as so many signs of weakness on the part of the boss. Other men must be appealed to through their ambition, and the man who aspires to handle a working force successfully must learn to differentiate. Many a valuable man has been lost to the organization because the manager failed to understand these truths. It has been easier in the past to fire a man than to study him.

"Hire and Fire"—The Old-Time Manager's Duties

The duties of the manager in past years can be summed up in two ordinary English words—hire and fire—and, when he had performed these duties satisfactorily, he felt that he could read his title clear. He hired a man to do certain work, and if he failed to do that work in a satisfactory manner he fired him, and that was all there was to it. The man might have been with him one year or one month, it made no difference; he didn't handle the job right and the only remedy known was the toboggan slide. Finally, some timid souls began to suggest that they had some money invested in this man, either in salary or wages, and to ask how it was proposed to realize on the investment if they fired him out of hand. This started a mild investigation with startling results. It was discovered that many business concerns were losing thousands of dollars in the form of salaries and wages paid to employees who either quit or were dismissed before becoming an asset. One large concern in Chicago changed its entire working force every ten months and figured the yearly loss at over one-half million dollars. The result of these discoveries was that the gentle art of firing fell into disrepute and the accusing eye of the stockholders was cast upon the hiring. More care was used in selecting employees with regard to the likelihood of their remaining with the concern. Careless hiring and firing became a thing of the past, but, so far, little has been done toward fitting the man to the job, and the haphazard methods still in use are costing the business concerns of this country uncounted dollars every year.

Hire and Inspire—The Modern Manager's Job

The manager or superintendent of the future will be one who knows whom to encourage, whom to drive and whom to coax. When he sees a big, slow-moving man working at a job requiring light, quick action, he will immediately shift him to a position more suited to his deliberate movements. When he finds a light, quick, active man working on a slow moving machine he will place him at work where his agile fingers and active brain will find their fullest expression. In a word, he will know how to fit a man to his proper job so that the organization will work smoothly and harmoniously. He will recognize the trouble maker as soon as he sees him and be able to place him where he will do the least harm. He will be a diplomat, adjusting complaints without friction, heading off trouble before it has a chance to express itself, playing one man against another so as to keep the organization properly balanced and with one object constantly; to keeping his organization working silently and smoothly like a huge, well oiled machine.

It may be thought that I have cut out a big job for the future manager, and that my prophecy will be more of a delightful theory than an accomplished fact, but, when I state that this very work is now being done in the larger and more progressive business enterprises, it will be seen that the work is beyond the experimental stage. It has been demonstrated to the satisfaction of hard-headed business men that this work is feasible, and, as they long ago saw the folly and wastefulness of present methods, they are beginning to look

around for superintendents who have a sufficient knowledge of men to do this work in a satisfactory manner. After all, doesn't it appeal to you as being the height of folly to have five hundred to a thousand men in your employ and know absolutely nothing about their personality, their habits, their inclinations, their aptitudes or even their home addresses. When you install a new machine in your establishment you study its operation, you test it, you learn its advantages and its shortcomings and investigate the best methods of getting the greatest production from it, and yet the poorest paid workman in your employ represents more of an investment than the highest priced machine in your factory. After all, isn't it just as important for a superintendent to know something about the men working under him as it is for him to have a knowledge of the machines they operate?

This subject is one which deserves the careful thought and consideration of every employer. The time has arrived when profit and loss on labor are the determining factors in the success or failure of a business enterprise. Many employers flatter themselves that they have an organization when, as a matter of fact, their so-called organization is little better than a mob. How often have we seen waves of dissatisfaction start, apparently from nowhere, and run like wildfire through the force, reducing production, and affecting adversely the quality of the day's product, while the superintendent is blissfully ignorant of the fact that anything is wrong? How often do jealous, bitter rivalries and desperate effort to shift blame arise in the shop and continue for weeks with no one to adjust the trouble and smooth out the ruffled feathers of the employees involved? These things are constantly happening wherever men are employed, and, unless the man in direct charge of the organization knows his men and keeps in touch with them, the output is bound to be affected injuriously.

While keeping in touch with the individuals do not forget the organization as a whole, as it is worthy of your utmost efforts. Leaders come and go but the organization goes on for ever. Much has been done, said and written lately about welfare work, and most of it absolutely futile. Welfare work will never take the place of fair compensation and proper working conditions. In fact, the very foundation of effective welfare work is fair wages and proper working conditions. If you are not prepared to pay your men a fair wage and see that the surroundings in which they work are adequate for the protection of life, limb and health, every dollar spent in welfare work is just so much money wasted. The question may be raised, what are fair wages, and it can be answered only relatively to the nature of the industry, but in every case their fairness or unfairness is determined by the wages generally paid in like industries throughout the country or competing territory. The question of proper working conditions is determined by the nature of the industry, regardless of working conditions in other like industries.

If you have laid the proper foundation by paying fair wages and furnishing proper working conditions you are ready for the right kind of welfare work. The manner in which this is done will have a profound effect, either for good or ill, on your organization. If it is done in the manner in which you throw a penny to a beggar it might better not be done at all. I am inclined to believe that the whole subject of welfare work should be treated from a purely commercial standpoint as the only means of rescuing it from the category of charity and lifting it above suspicion. If you are going to do any welfare work do it with the frank object of increasing the output by making your employees more happy and contented with the resulting efficiency which such conditions always bring. Much welfare work has done more harm than good because it has been done in a patronizing way which no self-respecting employee could do otherwise than resent.

Retailers Co-operate Upon Credit Work

Bureaus in Toronto and Ottawa Enabling Them to Eliminate the Dead Beats—Collection Work Also Improved

One of the interesting developments in connection with the retail trade during the past year has been the formation, in a number of cities, of credit associations for the protection of the trade. This movement has already made considerable progress both in Canada and in the United States and wherever it has been started it has proved a source of great benefit to the trade. In Canada, the chief instances are those of Toronto and Ottawa, a lumbermen's credit bureau having been formed in each of these cities.

The chief idea underlying a lumbermen's credit bureau is the interchange of information between members. As applied to the retail trade it resolves itself into an exchange of information as to the amounts purchased by each customer, the amounts for which accounts are outstanding, lists of bad accounts and judgment accounts. In order to make this sort of an association a success it is essential that the trade should co-operate whole-heartedly with one another. Upon this basis only can the plan be worked out. When it is worked out its benefits are immediate and far reaching. In the case of the Lumbermen's Credit Bureau at Toronto, the members submit each month a statement showing the names of every customer on their ledger. Opposite each name is shown the amount of his purchases that month and the amount for which he may be overdue in his account for purchases during previous months. This is the chief source of information available to a credit bureau. When it has been tabulated in the office of the bureau, it shows the exact amount owing by each customer to the whole trade and how much of the amount is overdue. Members of the bureau are able to secure this information immediately, although in giving out information it is an invariable rule with all the bureaus so far established, that the names of the members of the bureau shall not be divulged in connection with a customer's account. By this means, although each member may obtain the essential information regarding a customer he cannot learn how much that customer buys from an individual member.

In the course of a few months' operation of a credit bureau, the members become possessed of statements showing the exact course of events in connection with each of their own customers, that is to say, they learn whether their customers are dealing with them only, or with other retailers as well, and how their accounts stand with the trade as a whole. Such information is invaluable in enabling the retailer to avoid the danger spots among his customers.

In addition to information regarding current accounts it is the custom of most of the bureaus to obtain from their members and to distribute among them a complete list of all accounts that are considered bad, and also of accounts in connection with which judgments have been obtained. These two lists, together with the current account information, place in the hands of a retailer a practically impregnable protection against the dishonest customer.

One of the members of the Lumbermen's Credit Bureau at Toronto, in discussing the matter with another retailer, who was considering the advisability of joining, laid the situation before him clearly and concisely in the following manner:—

After one year of successful working of the Lumbermen's Credit Bureau there is not one member of it who would part with his membership for four times the amount of his annual fee. There is not one of us who has not received in actual results, many times over, benefits that cannot be counted in dollars and cents. We have illustrations of it almost daily when dead beats come into our offices and we are able to give them the lie because of the information we have at hand through the bureau. There is hardly a day passes, even with the few enquiries that have been sent out since the first of the year, when somebody has not been called up short and asked to pay cash who has come in with an air of confidence and claimed that he was entitled to credit. The value of the bureau information to the retail trade alone is of such importance that anyone who is not already a member should look into it for his own sake. Many instances of its advantages could be given.

A certain member of the bureau reported recently that he had a party in his office enquiring one day for a large bill of lumber. The man was a stranger, and after giving him a price upon the lumber, which was satisfactory, the retailer asked him how he was going to pay for it. The stranger replied that he need not question his ability to pay as he had been buying lumber in Toronto for the last twenty years and did not owe a cent to anybody. The dealer said that he would let him know in the morning whether he would send up the material. In the interval he communicated with the bureau and was astonished to find that this man had some 31 liens registered against his property. When the man returned in the morning for his answer and was confronted with this information he did not dare to deny it and was very anxious to find out where the information was obtained. The consequence was that the dealer patted himself on the back for a whole week for his luck in keeping out of the hole, and incidently for making a cash sale.

When retailers co-operate in this way to exchange information

with one another, it is possible to obtain information about a customer so expeditiously that before he leaves the office the retailer can know with complete certainty just how to deal with him. It is an interesting indication of the effectiveness of this type of co-operation that, in Toronto, retailers are now ascribing to the work of their bureau the fact that building operations have recently fallen off extensively. At first glance this might appear to be either an exaggeration or a disadvantage. However, there is no doubt about the actual facts, and retailers are convinced that much of the falling off is due to the fact that speculative builders have been pulled up short, even in the brief space of one year, to such an extent that their operations are now reduced to a minimum. The meaning of this is that dangerous customers have been greatly eliminated and such trade as is in progress today is of a much sounder and more profitable nature than has ever been the case in previous years.

As to the actual falling off in the total amount of trade, there may be some who will think that this is a disadvantage. On the other hand, it must be remembered that the lumber dealers have their lumber in their yards instead of having it out on jobs for which they never would have been paid. The decrease in the building trade in Toronto is unquestionably in no small measure due to the fact that the men who built largely and bought indiscriminately, from parties who are easy enough to furnish them with material—now that they are up against a credit bureau—can neither get the lumber nor build the houses. Heretofore, they built the houses with the lumbermen's money and the lumbermen got nothing to show for it but mortgages or uncollectable debts.

Collection End of the Work

An important feature in connection with lumber credit bureaus is their account collection work. Retailers co-operating in exchange of information find it advantageous also to co-operate in the collection of many of their accounts. A credit bureau can, in many cases, secure payment when a retailer finds that he can do nothing. By charging a small percentage for collection work it is possible for a credit bureau to make a small profit which can be applied to the defraying of general expenses.

Undoubtedly the success of this co-operation among Toronto retailers will make its effect felt in other branches of the trade. Wholesale members of the Lumbermen's Section of the Toronto Board of Trade are seriously considering the extension of the credit bureau to their own business, as they realize that the members of the bureau are now better protected for credit than those who are not members. Consequently, a number of them are anxious to form a bureau embracing the wholesale trade, believing not only that their own business operations will be greatly simplified, but that the general standing of the wholesale trade will be improved.

It will be noted that the principle connected with this form of co-operation is entirely different from that of the ordinary mercantile agency, which gathers information regarding the credit rating of mercantile firms. All the facts and figures secured by a co-operative credit bureau are furnished by the members themselves and handled by a staff which is sworn not to divulge any information which is not absolutely required by the by-laws of the bureau. As a result, the members have no hesitation in giving, freely and fully, all the information they can command about their customers or about anybody else. It has also been proven to the customers of the retailers who are worth having that the bureau is as much to their advantage as it is to the advantage of the lumbermen, as it enables the lumber dealer to close out from their competition all the dead ones who will not pay their bills, thereby making it easier for those who will pay their bills to secure their contracts at a living price. The main object of a credit bureau is to erradicate from the building trade all the dead beats who take contracts at less than they are worth and beat the lumberman out of his money, thereby causing a hardship to decent contractors who pay their way.

A Few of the Retail Lumberman's Problems

Trade-Getting and Holding Grow Out of Knowledge About Materials and Rendering Practical Service

By H. R. Isherwood

SUCH a subject as "Problems of the Retailer" is a very difficult one to cover. It is of great interest not only to retailers, but to lumber manufacturers as well. The problems and suggestions I discuss will be given from my personal experience, and will cover only a small portion of the many problems and different problems that confront retailers. My ideas may seem somewhat radical to manufacturers, but I am presenting them because they represent my sincere convictions as a retailer and are founded on my experience as such.

With the increase in cost of materials and additional expense of operating, coupled with a keener competition with local dealers and mail order houses, ready cut houses and other so-called distributors of substitutes for the various kinds of materials that we sell, the retailer is placed in a position where it is absolutely necessary for him to adopt more modern methods to meet the obstacles and to retain the volume of sales.

For me to cover the subjects that I feel manufacturers are most interested in, it is necessary to put some questions to them. As manufacturers of lumber, shingles and lath, you work your lumber up in various ways, such as ordered and required by the retailer. Have you investigated the use of this lumber which you manufacture and which the retailer sells so as to know whether it has proven satisfactory and if there is any room whatever for improvement? Do you, as manufacturers, furnish information to the retailer who buys your lumber, intelligently informing him how to apply, treat and preserve the lumber that you sell him, and the reasons why? Do you furnish the retail lumberman information when you sell him lath, tell him how to apply and give him information upon the different grades and varieties of wood, and why one is better adapted for certain plasters than others? Do you furnish retailers who purchase your shingles information how to make the best foundation to apply these shingles, how to lay the shingles, how to treat them to preserve them, the proper nails to use, the grades of shingles that are best adapted for the different types of buildings, and state to them the reasons why they should follow these instructions?

Retailer Needs Information from Manufacturer

To the best of my knowledge I believe I am safe in saying that such information has never been furnished the retailer. Is there any reason why the retailers should not have had this information furnished them by the individual manufacturer in circular or pamphlet form, not only for the retailer's benefit, but to be distributed to the customers of the retailers. Information about other materials such as retail lumbermen carry is furnished in printed form for distribution to our trade, with the explanation just how to apply the various materials, and the reasons for so applying, to get the best results. In each instance you will find the manufacturers of three so-called substitutes of lumber, giving the reason why they are considered superior to your products and others.

The lumber manufacturing industry has been known as the "Slumbering Industry," but the southern and western states industries have awakened and the north is emerging. Manufacturers must realize that they must develop and co-operate with the retailers. I have contended that it is the duty of you as manufacturers to use your brains, your energy and your money to create this demand for your product. This should be done not only directly through the retail lumber dealers, but through the consumer, and in turn the retailer should use his brains, his energy, and his money to co-operate with you in this venture. While I am giving you my ideas upon this subject, which I know you already have in mind, and which you are working upon, I believe it is a duty I owe to my brother retailers to carry this message to you so as to make a deeper impression upon your mind.

Not Properly Acquainted with His Goods

My first contention is a most vital one. It is that the average retailer is not properly acquainted with the product he handles. I mean to say that he is not thoroughly versed in the various grades and in the advantages and disadvantages—of the various kinds of woods for different uses. It is highly important that the retailer should have this knowledge. Without it he cannot properly advise the purchaser regarding the best wood for the purpose desired.

The retailer's advice should not stop at a selection of woods, but he should know how that wood can be treated to preserve it, and retain its good appearance. This, too, is as important to the purchaser as the right selection of woods.

The time has gone by when the retail lumberman can remain seated in a dingy old office waiting for unsolicited business to come to him. He must be up, alert and doing, seeing to it that his place of business is made attractive and up-to-date, his system perfected

and his sales force fully versed in the art of selling. I am glad to note that the old method of selling lumber is past. The dealer who is holding the trade today and increasing his sales is one who is needing the new ideas.

It used to be, in the years past, that the retailer had no voice whatever, nor took any interest in what people used in the construction of their buildings. It was not necessary, as the customer or carpenter made up his list of materials and we figured and furnished just what he specified. Specifications would always run close to the native products as southern and western products were not advertised or much known at that time.

Retailers Changing Their Methods

However, as time went on I noted changes for the better gradually taking place. After the southern and western lumbermen began to advertise their products, and various substitutes for lumber were put on the market; and the advertising campaign started, it became necessary for the retailer to pursue a radically different course. Today, the retailer must know the products that he sells, particularly lumber. To know whether it is suited for the purpose specified; to know how to treat it; to know more of the different designs to work the material into; to make it more suitable for the purposes, giving the desired effect to meet the approval of the purchaser—these are things the modern retailer cannot ignore.

In order for us to earn a profit we, as retailers, need greater knowledge of goods we sel, and we need greater knowledge of proper and profitable publicity, and of modern merchandizing. My ideas are from the experiences I have had in the past, to secure a better knowledge of goods we sell, and we need greater knowledge of proper and merchandizing methods of today, that "service" is the answer to the whole problem.

Neither the retail lumberman, nor you as manufacturers, can charge for service in this open, or at least understood manner. As service is most effective when least expected, the fact remains that it is a recognized factor today, that service is the means of getting new trade and holding the old customers in the face of competition.

I have had the opportunity of hearing retailers talk on the subject of service, and some of them said they were going to stop talking service because they could not see where it did them any good. It is true; it did him no good, simply because he talked service but didn't render it.

The retailer who will give service to his trade cannot help but become better acquainted with the products which he sells. To illustrate this, I will say that when I first started in business in this section, I immediately began taking an interest in the buildings that my prospective customers were about to build, drawing them plans in a crude, rough way, and in many instances making out a list of material for the building. This gave me an opportunity to become better acquainted with the actual construction of the buildings, and compelled me to give consideration and thought to the various materials for the construction of different buildings. Thus I became more and better acquainted with actual building needs as I developed the "Service Department." Now I have reached the point where I am furnishing plans—real blue prints—to my customers without any charge whatever.

In doing so, I find it is up to me, or my contractors, who I am keeping in line as well as possible, to make up, and estimate on, a list of material, and specify the right kinds and grades. This gives us an opportunity to specify the kinds and grades that we can sell to the best advantage, but we always take into first consideration the customer's interest. In rendering this service it gives us an opportunity to become better acquainted with the people we are doing business with, and by rendering service and backing it up with satisfactory goods and methods of construction, we make satisfied customers. This is what increases our sales.

Rendering this service not only brings me in contact with my customers oftener, but it makes it quite necessary for me to visit the locality in which these buildings are being erected, which I find is a very good policy, because it widens our acquaintance with the people in general throughout the country. We get ideas of the ways and methods that they follow in their farming, or whatever business they are in. We have an opportunity of getting better acquainted with the younger generation and discussing different problems with them, which we find they are all interested in.

Educating the Salesman

Now, inasmuch as manufacturers throughout the country are repeatedly adopting new methods of marketing their products, I assure you it will be necessary, if you wish to keep in line with them, that your representative, the lumber salesman, who in the past has been too much of an order taker, and has not fully understood all those things which are needed in the marketing of your product, should not only be familiar with your product by knowing the places it is best adapted for, its advantages and its disadvantages, but should know more about the product which his product has to compete with. He must have in mind information and facts placing him in a position where he can meet any and all arguments. He can do much in giving the retailers information that they can use in selling the product. In other words, he can do much in helping to educate the retailers in the lines of modern merchandizing and of placing them in a position to meet competition, not only on the product itself, but to meet competition with other substitutes that are offered in its place.

This information and knowledge which you can obtain of the products you manufacture, which you in turn can enlighten your salesmen with, should be in pamphlet form for distribution not for the retailer's interest only, but in such form that the retailer can distribute it to his patrons. It would not be a difficult matter for you to carry this out by having your sales manager and salesman co-operate with the secretary and his assistants of your manufacturing association. It would not be long before they would be known as authorities on the wood products you manufacture, and it would do much toward improving the conditions with the retailer and getting the retailer to that point where, if he takes an interest in his community, he will soon establish a reputation as an authority on wood products which he sells, and matters relating to buildings.

The retailer who renders "service" such as I have outlined will not be long in establishing his own reputation in his home town as an authority on material that he sells and on the construction of buildings. However, it will be necessary for him to have a complete assortment of plans, plan books, books of every description pertaining to the materials he sells.

There are many opportunities for you, as manufacturers, and for the retailers, to improve the conditions and open new fields for wood products. I am going to cite a few ideas that I have in mind which I believe will be of interest to you, as they have proven a great success with me.

Play Houses

For instance, the idea occurred to me a few years ago of building a small children's play house entirely of wood for exhibition at the County fair, and giving it away as an advertising proposition, by having a guessing contest. It would have surprised you if you could have seen the interest that was taken in this play house, not only by the younger generation, but by the older people as well. The old saying is that if you want to reach the heart of the parents it can be done through the little ones. We not only arouse interest in the little ones but created goodwill among the parents, for through this play house we sold many a bill of lumber to parents for the construction of a like play house. Thus we opened a new field for our product.

Afterward it occurred to me that if a play house would create such a demand for lumber, why wouldn't it be a good idea for the retail lumberman to build a miniature house, say 8 x 10 ft., or 10 x 12 ft., one room and a small porch—give it a buigalow effect, using hemlock, white pine, Norway pine, white cedar shingles and hardwood flooring; treating the siding with creosote, the shingles with shingle stain and all the trimmings with paint, and thus put before the people an idea in tangible form of a home built entirely from materials always carried in stock for immediate delivery. There is much to be gained in making a sale by having an actual illustration of just how to use the material and how it looks made up. I have every reason to believe that this would be a strong feature in making sales in the various localities.

Bird Houses

I have noted with interest in many States, the different contests, and the interest thus created, in small bird houses. Since noting this interest, especially among children, I have gotten together the various pamphlets upon bird houses and found it is an easy matter to get the local newspapers to give publicity to this movement. Through this channel I expect to dispose of material to the boys of my town for building these houses. There are many other ideas that can be worked out that would create a demand for lumber.

Now there are other ways that are too numerous to mention in which your manufacturers' association can stimulate a demand for your product. I wonder if you have ever realized and noted that the material you manufacture and which the retailer has for sale, is the only material used in and around the house that the women cannot buy? I don't believe that there is a single home in any of the towns which you gentlement are in, or where the retail yards are located, but what this very moment there is not something wanted, which you have for sale. I believe that you find this statement to be true largely, that when the residence is complete and workmen have left the house and the family moves in, the interest of the building material man ceases. This is another suggestion that I want to impress upon your mind, that you as manufacturers and we, as retailers, should not stop when the sale is made and goods are delivered, but should take an interest in our product after it has been delivered and in use. We certainly should be interested in these buildings to the extent of seeing that the materials that we have delivered have proven satisfactory, and if not, the reason why they have not, so as to insure our future customers and business interest.

Referring again to the shingles. A short time ago a farmer came

into my office with a large barn bill and I noted that all the material to complete a good sized barn was included in this bill, but there were no shingles. I have always made it a point to note if there are any articles such as shingles, lath or other items that I know would be necessary to complete the building, that are not included, and to make enquiry of the prospective purchaser. In this instance I asked this farmer what he intended to use on his roof. He stated he was going to use galvanized iron. I informed him that we have some very good shingles for barns of a very good grade at a reasonable price. He then stated he would not put wood shingles on his barn; and this gave me an opportunity to ask him the reason why. He stated that in noting various barns in his neighborhood during the threshing time, that much dust and chaff covered the roof and it remained there. When the rain came it would form a sort of crust over the shingles which held the moisture and rotted the shingles.

Now, gentlemen, this was his reason for not using wood shingles. My suggestion to him then was that the cost of a good white cedar shingle dipped into a good creosote would be less and it would be much more serviceable than the galvanized iron, and the shingles would be protected against rot. Now then this will give you another problem.

Cement

We often hear the word "substitute" used. We hear this used when speaking of cement, yet a large percentage of the retailers are distributors of cement. My contention is that the substitute is not to be feared. It is entirely up to the distributors of building materials to recommend and sell the materials that are best suited for the purpose required. In order to accomplish this good, as I have stated before, it is necessary for the dealers to become better acquainted with all of their products so as to know the various kinds of material and what they are best suited for.

It is very unreasonable for one in the lumber business to advocate the use of wood for purposes for which he knows, in his own mind, cement is best. And this applies as well to cement, where wood is best.

Wall Board

Now take wall board. Wall board is sold and advertised as a substitute for lath. I am selling from seventy-five to a hundred thousand feet of wall board annually and yet I cannot, in any way, see where this is taking the place of lath or plaster, because it is being used for purposes where lath or plaster were never thought of, and never would be used. It has opened up a new field, and a profitable one, for all the retail lumber dealers.

Prepared Roofings

Prepared roofings today are undoubtedly one of the greatest gambles that the public have to deal with. The great variation in grades and quality, together with the largely fictitious advertising and unreasonable statements as to guarantees, makes it a business that cannot be depended upon in general. However, a lumber firm with one good and reasonably reliable product, can sell this material for buildings that require its use, and this is usually where shingles cannot be used under any conditions. A good, standard reliable brand is a profitable and satisfactory article to carry and sell.

Silos

One of the subjects that retailers are all deeply interested in is the silo. The silo is one of the most important structures there is on the farm today, and one of the most profitable to the farmer. This is a proven fact, so requires no discussion. However, the different types and kinds of silos are an interesting subject to be discussed at this time. We know that the one most important feature in the silo is the preservation of the silage; and the best silo is the one that holds the heat longest. Comparing the stave silo with the concrete, hollow tile, brick and other types of silos other than wood, we know that these latter are all contractors of cold, and that for this reason the wood silo has many advantages over any other silo.

Yet with the stave silo or any other silo, there is one point vital to all—and that is, proper construction. I will say that the concrete silo can be made a good serviceable silo if properly finished on the interior. Likewise, the stave silo can be made a very serviceable and lasting silo if properly constructed.

The greatest injustice that I know of today in the construction of silos is that so many of them are so cheaply constructed that they keep their shape or form only for a very short period. When they get out of plumb, hoops become loosened, causing them to get further out of plumb, it not only makes them look unsightly, but it is impossible to tighten the hoops and bring the silo back to position so the joints will be air tight.

Plenty of Water in North Western Ontario

Editor Canada Lumberman:— Keewatin, Ont.

There is plenty of water in this vicinity and there should be no difficulty in getting all the logs out this year. Very few logs were put in here during the last winter. Market conditions are fairly good—Keewatin Lumber Company, Limited.

Retail Association Gets Results

Southwestern Ontario Dealers Demonstrate Benefits of Co-operation

One of the most progressive associations of retail lumbermen in Canada is the South Western Ontario Lumber Dealers' Association, which has been doing a lot of practical pioneer work among the retailers in its district and has met with much success. The annual meeting of the association was held on April 28th and a number of interesting matters were discussed and disposed of.

The members of the association find that the older their association becomes the more the dealers feel the benefits derived from it. The great aim of the association is to promote a better feeling among the members and to induce them to place full confidence in one another. The trouble with organizations of this nature, and with the retail trade in general, where it has not been organized, is lack of confidence, a condition which prevails especially in cities where there are a number of dealers.

One of the practical matters brought up at the last meeting was the subject of figuring upon plans. After a lengthy discussion it was decided to abolish this practice, as it was found that several members were in the habit of making out a bill from a plan and guaranteeing to furnish all material for a building at a certain fixed price. The association is now making an effort to establish a practice of having all contractors and carpenters bring in their own bills, as they feel that the carpenter who is not capable of making out a bill of material should not be trusted to make a contract for a building.

Keeping Tab on Wholesalers

Another way in which the Association is trying to improve trade conditions is by inducing wholesalers to sell to retailers only. This, of course, is one of the chief objects of the association, and so far they have succeeded very well in certain districts, but where towns are near wholesale yards they are finding it a much more difficult undertaking. They report, however, that they are looking forward to correcting this situation entirely during the present year. Their method of handling it is to hold a meeting every month and discuss any reported violation of their rules.

In connection with their own internal affairs such as the management of yards, they are working together in a commendable manner and securing quite definite results. One way is by educating their members to a proper appreciation of the fact that it costs something to do business. Some dealers have no idea whatever of overhead expenses. One dealer, for instance, claimed that he could sell posts cheaper than his neighbor because he owned his own boat and his freight did not cost him anything. Another dealer estimated that 25 cents per thousand was a good profit on shingles, even though he had to team them half a mile. There are several dealers also, known to the association, whose business methods are far from ideal. Some of them, for instance, have never taken stock since they went into business.

Frequent Meetings Promote Mutual Interests

All of these matters are freely discussed at meetings of the association, along with market conditions, the best wholesalers from whom to buy certain kinds of lumber, etc. If some of these wholesalers could hear themselves discussed at the meetings of the association, they would probably exercise a good deal more care in filling their orders.

From this outline of the work of the South Western Ontario Lumber Dealers' Association it will be clear to our readers that the association is a very live and practical one. Their secretary reports that there seems to be no end to the good that can come from the meetings of the members, and once a member attends, he rarely wants to miss another meeting.

The election of officers resulted as follows:—Chas. Hubbell, Thamesville, president; W, J. Taylor, Ridgetown, vice-president; B. F. Clarke, Glencoe, secretary; directors, F. H. Laird, Dresden; D. J. McEachern, Alvinston; P. G. Piggott, Chatham; W. H. Longfield, Mount Brydges, and G. D. McPherson, Merlin.

Hardware for Silos

A large woodworking firm wants to get in touch with manufacturers who make a specialty of hardware used in the construction of silos. The publishers of this journal will appreciate any information our readers can give.

The Abbotsford Lumber Company, Abbotsford, B. C., are shipping an average of sixty cars of lumber a day.

M M. Wall, Buffalo, N. Y.

U.S. Capitalists Heading for B.C.

Maurice M. Wall of Buffalo, N. Y., Enthusiastic About Red Cedar—Other Capitalists With Him

Many lumbermen both in eastern and western Canada are well acquainted with Maurice M. Wall, of Buffalo, N. Y., whose portrait we publish herewith. As a member of the Buffalo Hardwood Lumber Company he has had business dealings with most of the prominent lumbermen in Ontario and many of those in western Canada. All of his business experience has been connected with lumber. Every interest that he has connected himself with has felt the benefit of his business ability and energy.

Maurice M. Wall was born on July 16th, 1864, at Avon, N. Y. When his schooling had been completed he headed straight for the lumber trade, in the office of Frank W. Warren, at Avon, N. Y., but made his first real connection with a firm known as Stanton, Crandall and Company, who carried on a mill and retail business in a village bearing the name of Painted Post. His first independent connection with the lumber trade was in conjunction with his brothers, when they all went to Buffalo, in 1889, and purchased the Buffalo Hardwood Lumber Company, of which Maurice M. Wall became secretary and treasurer. The company has continually expanded and is today considered one of the largest and strongest wholesale lumber concerns in the east. Its yards cover eight acres in the heart of the railroad centre of Buffalo. Upwards of 15,000,000 feet of hardwood is handled annually at these yards and the company's customers extend throughout the northeastern and north central States.

Boosting British Columbia Cedar

Our object in outlining Maurice M. Wall's career for our readers is the interest he has taken in the Canadian lumbering industry. He has always been a practical lumberman, knowing the business from the stump to the consumer. His very wide experience and great success are proof that when he takes hold of any particular line of business it is something that has decided merit in its favor. One of his latest interests is British Columbia timber. In a recent interview, referring to this subject, he said:—"Red cedar shingles and siding have been used and recognized as superior for many years, standing the test of exposure to all kinds of weather. British Columbia has practically the only available cedar and will be the logical source of supply from now on. Then, too, builders are rapidly learning that cedar lumber can be put to practically every use that white pine has filled for generations. For housework, doors, siding, finishing, flooring and sheathing, as well as poles, ties, fence posts, etc., cedar stands up to every test. The widely varied uses and the vast market that is opening up made western cedar and fir look good to me. That is why I purchased this timber, and we were fortunate to get a low price for stumpage.

"I have a cedar board four feet square and 1¼ inch thick in my office. It stands against a radiator and has been there for nearly eight years. Although I had it planed on one side only, and in spite of changes of temperature, hot and cold, dry and damp, not a particule of warp, check or split can be seen after all these years. This shows me that western red cedar is a good, durable wood and I should think it might make good gun stocks.

"Cedar has taken the place of white pine for shingles and siding and is bound to be one of the most useful woods of the future."

These ideas are not mere theory on Mr. Wall's part. They are based on experience and investigation. He has been all over the northwest making an extensive study of the situation, and finally has decided to invest the savings of a lifetime in the purchase of timber. After careful search he selected what he considered to be the best tracts available and had them gone over by competent B. C. cruisers under the personal supervision of a thorough lumberman who had been one of his trusted employees for about fifteen years. Mr. Wall then made a trip to the northwest and looked over the property. Being completely satisfied, he associated himself with a number of Buffalo men and financed the purchase of what are said to be the best three pieces of forest growth in Lillooet, Yale and Cariboo districts, B. C. Each of the three tracts carries an average of over 300,000,000 feet, mostly cedar, but including also 100,000,000 feet of high-class white pine and about 100,000,000 feet of large fir timber. These tracts are of great height and massive girth, growing often as high as 100,000 feet to the acre. Each tract was cruised, mapped and estimated in most conservative fashion, and the facilities for cutting, hauling, driving, sawing and shipping were carefully verified before the purchases were made. The timber is so located that much of it can be felled right into the streams and delivered to the main line of railroad at a minimum of expense.

Mr. Wall and his associates are now contemplating the erection of a mill and are looking over their British Columbia timber with a view to starting an operation there soon.

Mr. Wall's activities in the lumber business have always been interesting to Ontario lumbermen and his new connection makes him a still more important factor in connection with the Canadian lumber industry.

A Notable Figure in the Trade

It would not be right to give an outline of Mr. Wall's business career without some reference to the National Hardwood Lumber Association. As first chairman of the inspection bureau of the National Hardwood Lumber Association he did the pioneer work in organizing its inspection department, formulating uniform rules and appointing the first corps of inspectors under bond. He acted as chairman of the bureau for several years. These were real services to the trade that will never be forgotten. After this bureau was organized and was in good running order, Mr. Wall resigned as chairman, but he was soon drafted again into the active work of the association, becoming chairman of its forestry committee. During his years in this service he collected exhaustive data and wrote some valuable papers on forestry and the visible supply of timber in the United States and Canada. For three years also Mr. Wall has been a director of the National Wholesale Lumber Dealers' Association.

In civic life Mr. Wall has also occupied an important place, having been president of the Manufacturers' Club of Buffalo, the nucleus of the present Buffalo Chamber of Commerce, of which he was a director for several years. He was for seven years City Park Commissioner of Buffalo and president of that body during the last year of his service. He was president of the Automobile Club of Buffalo for 1913 and 1914 and is now president of the New York State Motor Federation. The most recent honor to come in Mr. Wall's direction is his election as president of the Lumber Exchange of Buffalo.

Canadian Government Railways

Until quite recently Canadians have been in the habit of thinking of the Canadian Government railways as a peculiarly Maritime institution. The Intercolonial Railway, in its earliest days, ended at Riviere du Loup, not far outside of New Brunswick, in the province of Quebec, where it connected with the Grand Trunk, and in that way was put in touch with the railway systems of the western provinces. The extension to Montreal was made twenty years ago and even then the I. C. R. seemed still to be a Maritime institution. Few people at that time imagined that the government railway would some day be extended to tap the great grain country of the far west. During the past few months, however, ws have been growing accustomed to a new idea. The old Intercolonial of the Maritime Provinces has become a national institution and we are changing our habits of thought and learning to speak of the Canadian Government Railways instead of the I. C. R. Three separate systems have now been rolled into one: the Intercolonial Railway, the Prince Edward Island Railway, and the National Transcontinental Railway, and the western gateway for the time being is in Winnipeg. Events of recent days, moreover, point to the probability of the Canadian Government Railways extending in the very near future through to the Pacific Coast. Government ownership apparently is increasing in Canada. It is an old story in Europe, but in Canada the public has not yet learned to accept the principle of government ownership so extensively as the people of the Old World. If the example furnished by the equipment, service and efficiency of the present Canadian Government Railways can be continued, as the system is extended, we feel assured that government railway ownership in Canada has a brilliant future before it.

The Care of Woodworking Equipment

Its Importance Not to Be Exaggerated—Careful Upkeep Reduces Operating Costs and Encourages High Quality Output

By W. J. Beattie

A great deal of the success in connection with the operation of a woodworking plant, and in fact the operation of almost any kind of a plant in which power machines are run, depends upon the care that is given to the machinery in operation, and in the attention which is given it from day to day by those who are responsible for its up-keep. It is a common thing to find a manufacturer paying a good steep price for what he considers to be the best possible machinery, in fact allowing the price to be a really secondary consideration, because he has made up his mind that he wants the best machine that can be obtained in the market. It is also quite an ordinary thing to find that an expensive tool of this sort is installed and lives well up to its reputation during its initial performances, but in a week or two the novelty wears off, the interest of the employer in the machine decreases and he finds his attention taken by other schemes or plans. Then the new machine, unless it has a careful and efficient operator in charge, falls down in its work, and trouble is likely to commence. You will often find the same manufacturer quite ready to talk by the hour about how he might be able to reduce the cost of his product. He will tell you of this, that and the other scheme for getting a larger output, but many a time he will pass by one of the best means of effecting this result, namely, keeping his machinery well up to the 100 per cent. efficiency point. This is something that ought to be given far more study than it is. In fact, the care of machinery is not considered anything like as seriously as it deserves to be.

It sounds rather unreasonable to say that a manufacturer who is interested financially in the output of his plant will allow the machinery for which he has paid thousands of dollars to fall into a state of inefficiency, in fact to be reduced much below its capacity both as to quantity and quality, and especially in regard to quality. Facts, however, are stubborn things, and the writer is quite ready to assume the responsibility for saying, that if statistics could be secured, it would be found that 25 per cent. would be a high estimate of the number of factories in Ontario that can be classified as good in regard to the care given to their machinery, while the other 75 per cent. could be unquestionably classified as bad or indifferent plants.

Keeping Machinery "Up to Scratch"

It is quite an exacting task to keep woodworking machinery "Up to scratch." The high speed at which it has to be run, and very frequently poor installation, cause an excessive amount of wear and tear. In the larger factories, as a rule, this is not so much the case as in the smaller ones, as expert help is more often employed to keep the machines in proper order and to keep the saws, knives, cutter heads, etc., in good shape than in the small and medium sized plants. However, it is an ordinary thing to see this work badly neglected. It is frequently passed on to the "handy man" who may have time to do that babbitting job today, or perhaps next week. "Keep pouring on the oil and keep her going, or shut down occasionally and cool her off with a pail of water"; that is the type of advice so often handed out in the smaller plants, and the inevitable result is that much mischief is done which could have been avoided, and a considerable repair bill is entailed.

Everyone will agree theoretically, at least, that the proper care of machinery is one of the most important things to be attended to in connection with a woodworking plant, but how many of us have heard all too frequently, a manufacturer complaining about having to buy too much babbitt, or having to pay over 25 cents a gallon for machine oil? The same type of man is practically certain to buy belting which has about one-third or even one-half the necessary strength for the job. There are far too many men of this class in charge of woodworking plants.

To begin at the beginning, the first essential in the care of machinery is the proper installation of the machinery, and in the installation, the most important thing is to secure an absolutely firm foundation. A cement base is always desirable for heavy machinery, and if this is put in just flush with the floor, there will be no obstruction if it should be found desirable later on to move the machine to another position in the event of re-arrangement or enlargement of the plant.

The Importance of Proper Belting

Probably the next most important matter in the care of machinery is the type of belt used. It is important to have reasonably long belts, that is to say, to keep as good a distance from the line shaft as the room will allow, in order to avoid unnecessary belt tension. The writer remembers in this connection an instructive instance of ignorance and false economy leading to loss in the installation of belting. There are some funny people in the world in this regard, and this particular man was a good example. He was installing machinery in a furniture factory some years ago and the writer was in charge of the work. Everything went along satisfactorily for both parties until the fan arrived and they had to discuss where and how it should be located. The factory was about 50 feet wide and had two rows of columns, dividing the floor into divisions each about 16 feet wide. On each row of columns there was a line shaft. The fan had to be placed over against one wall, as near as possible to the shavings vault. From the centre of the nearest line shaft to the centre of the fan would be about 14 feet. It was not practical to drive direct from the shaft to the fan, as this would necessitate too large a pulley to produce the necessary speed. It was suggested to the proprietor, therefore, that the farther shaft should be utilized with an intervening countershaft. This would give good belt lengths and correspondingly less tension, but the proprietor had his own ideas about this kind of thing. He would not listen to any proposition about long belts, saying that they would be sure to drag and slip. No argument would convince him to the contrary, so up went a countershaft from the nearest main shaft, and the circus started soon afterwards. Those belts had to be pulled so tight in order to drive the high speed fan, that no amount of lubrication could keep the boxes from heating. After considerable loss in belting, oil, babbitt, time and sweat, the thing was changed and installed as it should have been originally. It is working still. This is an example illustrating the fact that proper installation is the first step towards keeping down the up-keep cost in a woodworking factory.

Line Shafting and Bearing Problems

The line shafting is something to which close attention should be given. It should be gone over at least twice a year and tested for straightness and level. This is particularly the case in frame buildings, or in new factories where the structural material is wood. Frame buildings are very subject to disturbances caused by heavy loads on the floor, unevenly placed, or by decay of the bottom ends of the upright posts, below the floor, which will draw the shafting out of level and, if severe enough, will cause heated journals.

In the case of a new factory of brick construction, and timber frame, the timbers used are generally quite green. As the shafting hangers are put perfectly in line everything will be lovely for a short time, until the timbers commence to shrink. This shrinkage is never even, and with centres very often only nine or ten feet apart there is trouble at an early date. If this is not watched closely until the shrinking of the posts is practically over, a lot of power will go to waste.

Many factories are now equipped with ball bearings or roller bearings on their shafting, in place of the old style babbitt boxes. The ball bearing shafting is a great power saver and will take not more than one-third of the power required by the old style babbitt boxes. In fact, the writer knows from actual experience of a shaft which, with all the pulleys on, equipped with babbitt boxes running at 300 r.p.m., took within a fraction of 11 horsepower. This included the drive belting of the different machines running over the loose pulleys only. This shaft was driven by an electric motor and the indicated horsepower was accurate. The shaft was taken down and a roller bearing shaft was installed, carrying the same pulleys and belting exactly, and the indicated horsepower required under the new conditions was only a shade over three. Ball bearing boxes, moreover, require very little attention. They must be properly adjusted and looked after for a few weeks until everything is running snugly; then all the care required is to put in the special lubricant twice a year. Roller bearing shafting is also used extensively and, while it is not so great a power saver as the ball bearing variety, it has virtues that are well worth considering.

Shafting should have close care and attention, to the same extent as machinery. It should be kept clean and bright. This is an easy matter when it is in operation, but never do the cleaning from a ladder. Stand on the floor and use a long handled cleaner of a shape that will conform to the shaft. Sufficient pressure can easily be applied to do the work, and in this way there is no risk.

Wood split pulleys are in much favor for woodworking plants.

These pulleys require tightening several times as the wood bushing will give somewhat with the strain, but once this has been overcome there is no further trouble. A good plan is to cover the sides of the pulley in, or rather over, with thin wood, so as to prevent the accumulation of dust. This will also probably save considerable power, though I have never been able to give this point a practical test. It looks to me, however, like ordinary common sense to assume that a pulley which presents no chance for air resistance will take less power than one having the broad wooden arms exposed to the air. There is also less disturbance of the air and the discomfort of working near or under an open pulley is done away with.

All bearings that are not equipped with drip cups under them should be provided with them, and if a good oil filter is used the bill for oil will be noticeably decreased.

Relation of Belting to Power

Enough has been written about the care of belting and about the different kinds of power transmission to fill volumes, but the same old mistakes are being made every day and will be continued for some time to come. The original belting mistakes were born in the shops where the machines were made, and they were much more numerous some years ago than they are today, as machine manufacturers have learned a great deal by experience. The mistakes in those days generally consisted of making the driving pulleys not only too narrow, but too small in diameter, and it was never possible with such equipment to get a belt to do the work when a heavy load was on. Naturally the belting was used up at a rate that brought joy to the tanners. While there are still many old machines doing business that illustrate these faults in a greater or less degree, the newer models have plenty of belt capacity, and the fault, if any, can now generally be laid at the door of the "careful" buyer, who will think that a single 5-in. belt will do, when a 6-in. extra single is the one to buy. Of all the foolish "economies" that are practiced around a plant, the most foolish is this of purchasing too light a belt. Any man who has had a fairly varied experience in this work knows the folly of under-belting machinery. It results in loss of time, power and production. All belting should be ample to carry the extreme load that is likely to occur under fair working conditions.

When you come to consider the applying of belting to machines and the care and attention given to the belts, it is a good plan, in the first place, to stretch a new belt, not too severely, before splicing and installing. A new 6-in. belt (extra single) will stand a stretch of ¼ inch to the foot, and this will make a more permanent job, as a new belt put on at the proper tension will require taking up again, sometimes in a few hours. A belt stretcher can be used to stretch the smaller belts before the splice is made. Belt stretchers are to be found in every factory for use with the larger belts.

The best belt lacing is "none at all." All belts should be spliced to ensure smooth running and even balance, which are so necessary in high speed operation. There may be times when it is imperative to use belt lacing, and there are many good articles on the market to fill the bill, but the writer is of the opinion that for high speed leather belting the spliced endless belt cannot be equalled.

The care of leather belting is frequently neglected. In a dusty factory the working side of the belts will become caked with an accumulation of dust, and the driving power will be much reduced. This accumulation can usually be scraped off while the belt is running and the belt should be treated occasionally with neatsfoot or castor oil. This should be put on the outside of the belt as well as the inside. It will keep the belt soft and pliable. A belt that has become oil soaked can be made fairly free of oil by being covered with air-slacked lime, which will draw the oil from the belt. All odds and ends of belting should be kept in a cupboard provided with shelves and not thrown like a pile of rubbish into a box.

Bearings and Babbitt

In connection with the general care of machinery, such as looking after the bearings and keeping the machine clean, a good babbitting outfit is an absolute necessity, together with the ability to do the work properly. A small portable forge, babbitt ladle, babbitt scrapers, etc., are all required, also gasoline compressed air torch, to warm the bearings before the babbitt is poured.

The proper way to do babbitting, on planer cylinders especially, is to have a piece of shafting the exact size of the planer shaft and use it, so as to avoid the inevitable danger of springing the shaft, by sudden application of molten babbitt. The spring may be very slight, but it will spoil the machine for first-class work and the only remedy would be to send it to the machine shop.

Always see that the spindle which is to go into a boxing is perfectly round and as smooth as silk. If it is not, send it to a machine shop and have just as little as possible turned off to make it perfect.

Babbitted boxes nearly always require scraping out after running, so as to ensure an equal bearing all around against the spindle. A good babbitt scraper is made similar to a gouge; that is, sharpened on the edges as well as the end so that they can be pushed or worked on either side. The way to detect the high spots in the babbitted boxes is to rub a distinguishing color on the spindle and revolve it in the box. The high spots will then be marked and can easily be seen. A box should always be babbitted before it becomes necessary to shut down the machine for repairs. This is one of the things that cannot be put off without involving additional cost, which increases with the length of the delay.

The Clean-Up Job

Keeping machinery clean is always a considerable undertaking and generally a disagreeable one if the disinclination of the men who do the work may be taken as an indication. It is a simple thing to run a pipe along the ceiling from which branches can be dropped at convenient intervals, fitted with valves and an adjustment to screw, say, 50 feet of hose to. The hose is provided with a nozzle at least 3 inches long having a very small opening at the discharge end. This will blow the dust off anything, and the work can be done when the men are not on the job, at noon or in the evening. Once a plant has been blown clean, it is not a hard or inconvenient task to keep it clean. Compressed air can be used for many other things about the plant.

It should always be the duty of some reliable man to oil the loose pulleys and suspended countershaft bearings, as men are notoriously careless in these matters and it is not always convenient to have ladders nearby when the oiling is to be done. Having one man to do this work will be found to be a more satisfactory factory plan, and it will cost less.

Compression grease cups will be found very useful on many boxes. They are preferable to oil lubrication, especially on moderately heavy bearings which are run at less than 600 r.p.m. In the line shafting where the babbitt boxes are used the caps can be made to accommodate the grease in sufficient quantity to last at least six months. If the box has a tendency to warm up, the action of the grease is hastened, and unless something is radically wrong, a hot bearing is uncommon.

The general up-keep of machinery is a vital question for every factory. It is a subject about which a great deal could be written in regard both to its effect upon the output and its relation to the loyalty of the men. It is a fact that men cannot take any pride in working in a sloppy plant and they are very quick to take on the same "dull gray tone" as the equipment reflects.

War Disturbs Mahogany Stocks

Philippine Wood Coming to the Front to Relieve Shortage of Other Lines

THE way in which the war has affected the lumber industry, both in the United States and Canada, is pretty well known to those who are engaged in it, yet few of them realize to how complete an extent the conditions arising out of the war have permeated the whole lumber business from top to bottom, including not only the better known lines of lumber products, but also those which are considered more or less among the choice and to some extent luxurious lines. The case of mahogany is an interesting example. It has become increasingly difficult, on account of the war, to obtain mahogany in any quantity. The scarcity of vessels and the lack of labor have been important factors in this connection, making it difficult for importers to obtain their usual supply of stocks from Africa and other mahogany-producing countries. As a consequence the price of mahogany has gone up very rapidly and manufacturers are puzzled to know what the outcome will be. One of the extensive dealers in mahogany at Toronto, The Wilson Lumber Company, report that they have found themselves in this quandary, and after investigating carefully have decided to handle stocks of Philippine (Laguan) mahogany. Referring to this wood, they report that, in their opinion, it is likely to increase in favor gradually, and eventually to replace to some extent African and Honduras mahogany.

Mahogany is found more or less in abundance throughout the tropical zone. It is only a very short time since the only mahogany used in any quantity was brought from Santo Domingo, but as time wore on and mahogany came into more general favor, the stock was brought from other points, until to-day. African wood is more generally used than any other. The beauty of African mahogany is found in its figure and in the txeture of the wood. It is easily worked and will probably always be in demand for the higher grades of furniture, such as dining tables, dressers, and all case goods. However, in chair work this mahogany is not used, Cuban mahogany being substituted on account of its extreme hardness. African wood is considered to be too soft to stand the strain of hard knocks to which a chair is subjected. The one serious defect found in African mahogany is the cross

or wind break. This is caused by the storms which frequently occur in the African forests, causing the trees to bend and split internally. Although this causes no real harm to the growing tree the injury is brought out in the lumber as a defect when the forest giant is eventually felled for commercial uses. Philippine mahogany, we are informed, does not contain this defect, although it does to some extent contain small worm or beetle holes. However, these holes do not affect the value of the wood in any way because they are little larger than a pin head and the use of a good paste filler obliterates them. Philippine mahogany, when these holes have been filled, take an excellent finish.

The wood is of two colors, light red, which is slightly lighter in color than a Mexican mahogany, and dark red, which is of the same color as Mexican or African mahogany. However, since all woods are stained, this does not have any effect on the finished product.

The texture of Philippine mahogany is practically indentical with African mahogany, being, if anything, more easily worked than the latter, which has a tendency to cross grain. The Philippine mahogany has more or less of a straight grain and therefore is more readily worked. It can be surfaced, scraped, sanded and finished to look equally as well as any mahogany now on the market, and the cost is considerably lower than African or Honduras woods.

Hardwood Playing an Important War Role

Emerging from Depression of Early War Period and Reflecting Activity Produced by War Requirements

Specially Contributed*

DURING the past two years, the hardwood lumber industry in Canada has had a rather checkered existence, certain lines at certain times have been in splendid demand and other lines have sagged. To quite a noticeable extent the trade has been regulated by the situation arising out of the war, a strong demand having developed periodically for certain lines, such as thick birch, which are extensively used in connection with shell boxes, gun stocks, etc. The furniture factories have enjoyed a rather intermittent demand, sometimes good, sometimes excellent and other times rather quiet. This has been the prevailing situation for a couple of years under conditions of this sort. Today, it looks as though during 1916 the manufacturer and dealer in hardwood lumber will again come into his own. Some lumbermen who view the hardwood situation from a somewhat casual outside standpoint may be inclined to think that this statement is more or less of a satire. However, I think those who have been dependent upon the hardwood lumber market as a means of enlarging their bank accounts will have to agree with me, upon investigation, that several years have elapsed since the manufacture of hardwood has really been productive of anything like a reasonable amount of profit, when one takes into consideration the effort which it has been necessary to put forth in order to secure business. In fact, many hardwood concerns would have been compelled to show a balance on the wrong side of their ledger during the past few years if they had been obliged to put a fair price upon their hardwood stumpage.

It seems a trifle strange, and one of the peculiar ironies of fate, in this year, when all true Canadians are looking upon the struggle on the European continent with mixed feelings of regret and hope, that the lumberman must really admit that the situation created by the war has brought about a definite improvement in the hardwood outlook. In August, 1914, we were just beginning to feel the discomforts of approaching financial depression. In western Canada the harvest situation had not been any too good, and, as a natural consequence, implement manufacturers, furniture manufacturers and musical instrument manufacturers had commenced to curtail their production. These industries had their money tied up in the west to a great extent and were not prepared to take on any further burdens. Similar conditions prevailed in other lines of industry. What may be said of the manufacturing concerns who are our direct customers was true also in regard to nearly all the other factories and, as an inevitable consequence, production of nearly every description was greatly reduced. Men were thrown out of employment in great numbers and prosperity ceased. Following this, and as one of its direct outcomes, building operations came to an end. Even the banks refused to grant us our usual lines of credit, so that, from the manufacturer to the consumer, industry and trade were being choked, and prosperity disappeared. At the end of 1914 there was no single line of business more completely at a standstill than the hardwood lumber business. This complete depression had come on so quickly that both the manufacturer and the wholesaler were caught with large stocks of dry lumber on hand and no sign of trade to take it from them.

The natural course for the banker to follow, under such conditions, finding that everyone was carrying heavy stocks of hardwoods, was to restrict us in our lines of credit. This was done immediately and the result was quickly seen in the volume of production. The greater portion of the hardwood output in Canada comes from small operators who were practically tied up by the refusal of the banks to extend credits. The production of 1915 was far below the average in quantity.

Hardwood's Place as a War Material

It was not many months after the declaration of war, before our hardwood manufacturers saw that they must take a prominent part in co-operating to defeat the Hun and to assist us in holding our place as a part of a great free nation. This called for the readjustment of our factories to meet the needs of war times and soon it was found that our woodworking factories in general were a very necessary factor in the making of war materials. It would be quite impossible for me, in a comparatively short space, to enumerate the hundreds of different lines of product our woodworking concerns have been able to turn out, which have been valuable contributions to war equipment. A few lines, such as parts for saddlery, gun carriage frames, automobile parts, gun stocks and shell boxes have consumed huge quantities of material; and in addition to these products which are of direct use as war materials there has been a great consumption of crating material. It is necessary to crate almost everything that we are sending to our allied troops, and for such a purpose wooden crates are really the only safe medium. Unless you will stop to count up the innumerable wooden articles that have to be forwarded to the front and the great quantities of crating materials that have to be used for their safe shipment you will find it impossible to realize fully what this war has done towards infusing new life into the hardwood lumber market.

What I have already said gives some idea of the direct effect of the war upon the activity of the hardwood industry and trade, but no trade or industrial activity can stand alone as an isolated beneficiarly from an active market. Our employees, finding their time fully taken up at remunerative wages have also circulated their prosperity by means of their own demand for what they require in connection with their domestic life. When employees are earning good wages they naturally are inclined to improve their home surroundings, and when doing so they consume a very varied line of manufactured articles, produced at Canadian factories from Canadian materials. Thus the returning prosperity is extended greatly and the extension works round in a circle so that it has, what I might call a reflex good effect upon the lumber business. In fact prosperous employees spend quite an appreciable percentage of their income upon goods made of lumber.

The Harvest of 1915

In considering the present situation in the hardwood trade one must not fail to attach full importance to the effect of the 1915 harvest. So great was this harvest and so good were the prices obtained by the farmers that the people of western Canada were immediately put back into a reasonably prosperous position which was quickly reflected in a renewal of activity among the implement manufacturers and the vehicle manufacturers, who were unable to supply the western requirements last fall. Thus the very industries which were important factors in the early days of the depression, because of their greatly restricted output, are now back in the industrial field as an important source of trade activity and are doing much to make business conditions satisfactory for the hardwood trade. Today, the implement and vehicle manufacturers, and a great many other lines of producing industries which consume hardwood are prepared to replenish their greatly depleted stocks.

Then there are the railroads to consider. The wave of prosperity and the enormous movement of freights that have developed in the last few months are placing the railroads of Canada in a position where they are not able to cope with the volume of business offering

* An analysis of conditions as seen by a prominent Ontario manufacturer and wholesaler.

and are definitely confronted by the necessity for taking on a great amount of new rolling stock. Car manufacturers are consequently calling upon the hardwood trade for quotations upon large quantities of lumber for this purpose.

Reaching Out Into Export Markets

I have been referring largely, in fact entirely, during the above discussion, to our home markets. Canada today does not have to confine her trade to her own markets. Canadians are now producing, in our native woods, goods that are quite the equal of those produced by any country in the world. During the last few years we have been steadily advancing our position by adopting high standards of grading. Now, thanks to our almost universal adoption of the National Hardwood Lumber Association rules, we are able to enter any market with our hardwood products and compete successfully even with our neighbors to the south.

For instance, we have today a huge market in the United States which, until very recently, we were only able to touch upon its fringe. The grading rules, moreover, have been studied very carefully by our producers and have had a good effect upon the manufacturing situation. These advantages are so important that a recent development in connection with the grading rules is looked upon with anxiety by a great many in the hardwood industry and trade. Extensive and far-reaching alterations to the rules are under definite consideration today. I greatly hope that the association will not now see fit to chop all to pieces the rules which it has enforced and from which so much good has resulted. If they do, I fear that in their effotrs to make grades for individual users, instead of generel rules which are applicable to the trade as a whole, they will be doing far more injury than good. These rules have unquestionably produced wonderful results for the hardwood trade; and one of the reasons why they have been of such widespread influence, is that they have been very seldom altered to any great extent. Business men have been able to develop their lines of production and trade along definite channels, knowing that their raw materials in the way of hardwoods would be available year in and year out, in definite and satisfactory grades. Therefore it seems to me unquestionable that, if a number of important amendments are made, the hardwood business will be disrupted to a great extent and the situation will be unsettled just at a time when it can least afford it and when conditions are settling back into channels of business activity and success.

The Situation Today

The quantity of hardwood stocks available today in Canada is a matter of the greatest importance. I have lately visited a large number of the most extensive hardwood producing centres in Canada and I am convinced that there is less dry hardwood unsold in Canada today than there has been for a great many years past. In fact, in many lines of stock, nothing that is dry can be found today. The only apparent surplus that I know of seems to be in our No. 3 common hardwoods. However, with the enormous advances in the price of steel, and with the great shortage in supplies of pulp and paper, there can only be one recourse for package materials, and that is wood. Spruce and pine have both advanced in price seriously and that is just where I think I see a demand developing for our No. 3 common hardwoods. Practical demonstrations which have been carried out during the past few months will lead to a general recognition of the fact that packages made from No. 3 common hardwood will soon be the solution for the supply of a strong crate. An objection that has frequently been offered to this stock for crating material is its weight, but if we remember that a hardwood crate of less than half the thickness of softwood will be fully as strong, we have no reason to worry upon this score.

At the beginning of 1916 the hardwood lumbermen of Canada are entering upon a period of business activity which, I think, holds out very bright prospects. There is practically no surplus of old stock to depress the market; the production during the past winter was not large; the financial position of nearly all the trade in Canada today is good and our laboring people are earning wages equal to, and in most cases considerably greater than, they have ever been able to earn before. The consuming trade, moreover, have awakened to the fact that times are reasonably good once more and that the producer is not overloaded with stock, consequently is willing to buy even at advanced prices. Under conditions of this nature, unless we over-reach ourselves, we should be able during 1916 to do a good business and to reap a reasonable return upon our capital invested.

Saw Milling Methods of Fifty Years Ago

Evolution of Manufacturing Practice in the Ottawa River District as the Logs Became Smaller

By I. N. Kendall

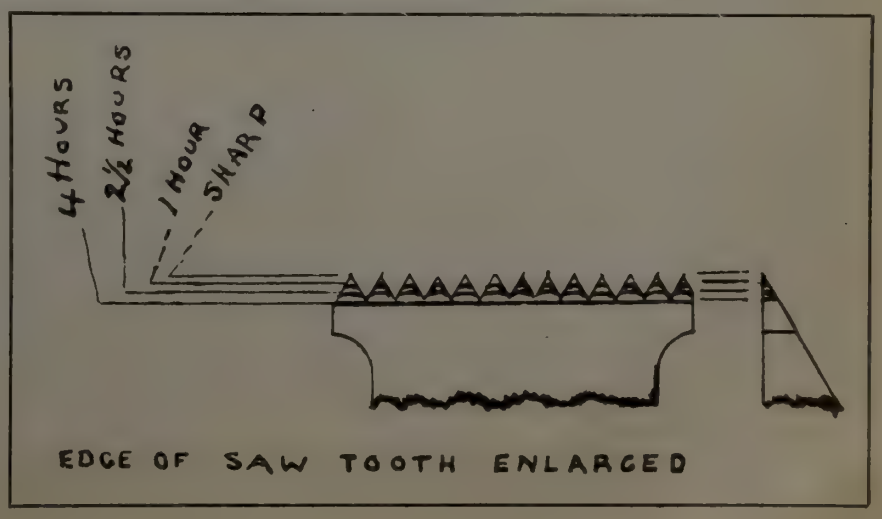
The development of the sawmilling business in the Ottawa Valley during the past fifty years has been accompanied by many changes in the type of equipment employed. The steady decrease in the quantity of large logs secured and the corresponding increase in the quantity of small logs have made it necessary to adapt the sawing machinery to the changed conditions. In a single section of the Ottawa Valley from Hawkesbury to Ottawa City, both places included, there were in the year 1864, or 52 years ago, 12 large sawmills. In all these mills the old style, straight line, vertical gang saws were used to cut the lumber. For slabbing operations or siding the logs, the saws used were from 6 ft. to 7 ft. in length, 8 ins. wide when new and No. 8 gauge in thickness. The stock gangs carried saws 4 ft. in length, 8 ins. wide and 11 gauge in thickness. The swaging of the saw teeth was done by hand with bar and hammer, and the sharpening was done with files.

In those days the timber was all white pine, the smallest log taken being 12 inches in diameter. Moreover, only the best quality of logs were then taken from the virgin forest. It was possible at that time to secure logs of this type on every hand and consequently the machinery and saws then in use were found very satisfactory. It is important to bear this fact in mind, as it helps us to understand the reason for subsequent developments.

Smaller Logs Necessitate Changed Equipment

Some twenty years later, the class of logs being taken out showed a great change and included a great number of smaller and inferior logs, as compared with those of the earlier days. The diameter of the smallest log taken out was reduced from 12 to 9 inches. It was then found necessary to change the machinery in order to adapt it to the new conditions. This was especially necessary in connection with slabbing or siding the logs of small size, for which purpose the twin or span circular was designed. Very good results were secured with this equipment where there was a limit to the feed of the machines of, say 4 or 5 inches to a revolution of the saws which were 54 inches in diameter, carrying 70 teeth. The results were not so satisfactory, however, in cases where direct steam feed was applied to these saws, with hardly any limit to the speed. I have seen a log fed 17 inches to a revolution of a saw of the above size. Uniform thickness of lumber or width of cants was quite out of the question with such rapid feed. In some mills at that time the single circular saw and carriage were installed for slabbing the logs, but the results were the same as with the twin or span circular whenever steam feeds were used without a limit.

After the introduction of the circular saw, there came the iron frame oscillating gang which was used for sawing the cants made by the twin and single circular saws, as it was thought by some of the lumbermen that more lumber could be produced by using a smaller number of machines. This was one of the ways in which they attempted to meet the situation created by the smaller logs. They suc-



ceeded to a certain extent, but it was found that the lumber produced with equipment of this type was not so smooth or so well cut in any particular as that which was produced with the old style gangs carrying thicker saws, longer stroke and less feed per stroke, the limit being 5 to 8 inches per stroke.

The Automatic Saw Sharpener

In the year 1884 a most important change was introduced in the method of sharpening saws when the automatic emery wheel saw sharpener came into general use in the mills on the Ottawa. This was found to be a great advantage in many respects, especially when associated with the pressure swages for spreading the points of the saw teeth. The time required for fitting up saws was considerably reduced. Saws of 14 gauge were now recommended for the oscillating gangs, this being three gauges less than that formerly in use. A saw kerf of 5/32 of an inch was tried as recommended, being 1/16 of an inch less than that of the 11 gauge saws. The good points in favor of the thinner saw and the oscillating gang were that they took out 1/16 of an inch less in kerf, operated at 75 to 100 strokes per minute faster speed, took ¼ of an inch increase per stroke in feed and handled cants up to and including 12 ins. thick "doubled."

The actual results secured from this equipment were something of a disappointment. Although the automatic sharpener was a distinct labor saving device and had other advantages, it was found that the emery stone in use at that time did not make so fine an edge as the file had made previously. The edge produced on the saw teeth was found to be notched as shown in the diagram, which represents an enlargement of a saw tooth. This diagram also shows how the edge of the saw tooth appeared from the time when it was sharp until after it had been in use for four hours. The saws, as is always the case with vertical gang saws, became long on the edge and the rest of the plate had to be hammered or stretched, to even up the tension, for a gang saw must always be kept tight on the edge. Bunches were made by the hammering on the sides of the saw and in a short time the saws became warm in the cut. The kerf had to be increased to 3/16 of an inch, leaving it only 1/32 of an inch less than that of the 11 gauge saw. Then it was found necessary to use thicker saws, and 12 gauge were ordered to replace the 14 gauge. The kerf was widened to correspond, being placed at 3/16 of an inch, the same as had been found necessary with the 14 gauge saw. With this equipment the lumber produced was found to be smoother, straighter and of very uniform thickness.

Sawmill Equipment in Eastern Canada

A comparison of present day machinery and that of twenty or thirty years ago in the Maritime Provinces

By John M. MacLean

THE production of lumber in Eastern Canada is quite a different proposition today from what it was a generation ago. Not only has there been a great change in the logging end of the industry as a result of the disappearance of the virgin timber, but the difference in the class of logs now being brought to the mills has rendered necessary a great many important changes in the equipment of the sawmills. The equipment that was quite satisfactory twenty or thirty years ago would not be acceptable in the sawmills that are operated in the Maritime Provinces today. In those earlier days the standard mill equipment consisted of the single log live gang, edger and trimmer. The slabs and edgings produced by this equipment were usually converted into laths. About 200 r.p.m. was the average speed of the single log live gang. The gang was equipped with 8 or 9 gauge saws. The teeth were given 1¾ in. pitch and the saw carried from 1¼ in. to 1¾ in. feed to each stroke.

This equipment, operating upon logs of the ordinary size of that time, would manufacture from 40,000 to 60,000 superficial feet per ten hours. It produced lumber at a lower cost than any other mill either before or since, but it also resulted in an enormous quantity of waste in slabs and edgings, and in the roughness of the surface produced, which necessitated further manufacturing in order to produce a satisfactory surface. Naturally, the operators of those days had their attention drawn to the problem developing out of this waste. In the end, the necessity for more economical operation led to the adoption of different methods of manufacturing.

Evolution Apparently Still in Progress

The evolution of the sawmill that has taken place since the old live gang was discarded has not produced any definite style of mill that has been so universally acceptable to lumber manufacturers of a generation ago. It is scarcely possible at the present time to find two operators who hold the same opinion as to what should be included in the equipment of a standard mill for the manufacture of logs into the various dimensions and of the exactness demanded by the different markets of today.

Although an increased price is obtained for lumber today, as compared with a few years ago, the manufacturer does not reap a corresponding benefit. There has been such a great increase in the cost of logs delivered at the mill and in the cost of labor that the increased price of lumber is practically offset thereby. It is essential, in connection with a modern mill which is to be operated profitably on the very much smaller logs that are now secured, that it must effect the greatest possible economy in labor and lumber, while at the same time it must be capable of producing the maximum of quantity and quality. In the endeavor to secure these results millmen nowadays are not yet able to agree as to what should constitute the equipment of a standard mill adapted to meet the requirements of the eastern lumber trade.

The circular mill has never been a really serious competitor of the live gang during the past, except in cases in which a mill was required to cut dimension lumber. The single and double cutting band saw have not come up to the expectations of those who were most enthusiastic about them. The drawback with the single and double cutting band saw has been the uneven thickness of lumber which these saws have produced. This difficulty is the result, to a very great extent, of the numerous connections in the setworks, which are difficult to regulate in such a way as to avoid lost motion. Inaccurate setting is a fertile cause of difficulties of this nature with band saws, and a further source of similar trouble is the tendency of saws to swerve from a straight line when they encounter hard lumber or when they are subjected to over-feed.

The only practical machine for cutting orders for dimension seems to be the carriage with setworks. This equipment will probably have to be retained in mills where there is work of this nature to be done.

The Band Resaw

In connection with the log band saw many manufacturers are now adopting the band resaw. The vertical band resaw is a favorite machine with some operators, because it helps to increase the output and at the same time improves the quality of the lumber manufactured. For the same type of work the horizontal band resaw also has its enthusiastic advocates who claim for this machine that it increases the output greatly, and that where the logs are small it is possible to take a single cut on the carriage with the log band, after which the log may be transferred to the horizontal band resaw and put through the machine a sufficient number of times to cut it into the exact sizes desired.

While each of the above methods is advocated strongly by many operators, an unbiased observer can scarcely fail to be impressed by the fact that, although the band saw saves a large percentage of lumber in saw kerf as compared with circular saws, there is still the difficulty of producing lumber of even thickness. Thus, what is saved in saw kerf with band saws, appears to be lost again in having to cut the lumber oversize in order to make up for the variation in thickness which results from saws that do not run true. This difficulty in connection with resaws, without doubt, is to a great extent the result of over-feed in trying to obtain the greatest possible production. In connection with the log band saw and carriage the difficulties are of the nature already discussed above.

Under the conditions prevailing in former days, before the operators found it necessary to bring out the small logs to the mill, the stock gang and resaw produced good results, but in recent years, as a result of the excess of small logs, the stock gang is being replaced by other varieties of equipment. The chief objection to the stock gang as a machine for sawing small logs into deal or plank is that so much space is required to keep the logs steady, and the width of the lumber is much reduced by the heavy slabs taken off. Moreover, there are other serious difficulties such as that of lining the logs properly for the saws when the gate is practically full of logs. If the logs are put through a stock gang only one tier in depth the capacity

is so much reduced that it is no longer a profitable machine to operate, compared with what it is when the logs are of good size.

Smaller Logs Creating New Problems

Year by year as the logs that are brought out to the mill become smaller than those of former years, it becomes increasingly more important that the equipment in the mill should be designed to manufacture them profitably into whatever the market demands. The circular gang overcomes the lack of capacity of the stock gang for small logs and at the same time gives the same standard of even thickness in sawing as that for which the stock gang has been so justly celebrated, producing at the same time a much smoother surface on the lumber. The circular gang, moreover, has the advantage of a considerably higher rate of feed, thus giving the operator an opportunity of placing each log individually in line with the saws, and enabling him to obtain the desired result much more regularly and easily. A very light slab only need be taken off the log for this machine. The lumber, therefore, is not reduced so much in width as it is by the use of the stock gang.

In the manufacture of English deals it is necessary to have a resaw behind the circular gang to convert the sidings into thinner lumber.

Many mills in Eastern Canada still retain the circular carriage, but new mills are not being equipped in this manner when the supply of lumber justifies more modern machinery.

When one takes into consideration the relative costs of saws and filing, the most favorable showing is made by the stock gang. The band mill makes the most costly showing and the circular gang comes in between these two.

I have outlined my own views in regard to these matters briefly, in the hope that they may be of some interest and value to other readers who have similar problems to solve. I feel that it will only be by an extensive interchange of views among those who are handling these questions that a satisfactory understanding of the problem of sawmill equipment in Eastern Canada will be reached.

An interchange of such views from correspondents, published in the Canada Lumberman, would be a great help to us in coming to a conclusion as to just what equipment should be installed in a modern sawmill in Eastern Canada.

Cleanliness Essential in Sawmill Upkeep

Neglect at Production End Keeps Down Profits All Along the Line—Too Much Indifference to Care of the Plant

By M. Lane

Indifference to small defects and carelessness in regard to the upkeep of plant and equipment are responsible for an almost incalculable loss in connection with a great many lumber manufacturing plants in Canada and elsewhere. This indifference and carelessness are difficult to understand, because, from the plain commonsense point of view their results are never classified in any column except that of loss. There are so many different kinds of indifference and carelessness that it would be quite a job to list them all. There is one kind of carelessness attributable to the employee and another kind attributable to the employer, and the two, when working together will create havoc in connection with any manufacturing industry. On the other hand, a spirit of co-operation enthusiastically shown on the part of both employer and employee will go a long way towards producing profits for the manufacturer. Why then does it happen that many mill owners, and sawmill owners in particular, exhibit so great an indifference in regard to the upkeep of their plants and exercise so little vigilence in keeping their employees up to the mark in connection with the proper care of equipment? It is a difficult question to answer and one to which a different answer will have to be given in connection with each case.

Sudden Desertion When Mill Closes Down

Fortunately there are exceptions, but in far too many cases these conditions prevail. Visiting a sawmill of this class at any time between the closing down of the plant in the fall of the year and the beginning of operations in the following spring one's attention is pretty sure to be drawn to something definite in the way of carelessness and neglect. We are speaking now of mills in Canada where the sawing operations commence about the 20th of May and close about the first of November. Visit one of these mills at any time after the latter date and you will probably notice a general air of neglect about the whole place. You will find many a mill in a generally filthy condition, with bark, sawdust, pieces of old iron, bolts, nails, shovels, sawdust scrapers, old cotton waste and other discarded materials too numerous to mention lying round about, and everywhere there is a general appearance of sudden desertion. Inside the mill you will often find costly belts hanging from shafting to the floor of the mill covered over with sawdust and bark as if they had seen their last day and were no longer required.

Then pay a visit to the blacksmith shop and the same state of affairs will be found as elsewhere, only the confusion will be, if anything, more intense. You will find drills that are not fit for further use, and taps and dies that are out of order and require renewing; all the result of inattention and indifference by careless or ignorant men who should not be allowed to use them. You will find iron of every description thrust under the bench into the blackest corner of the black shop. Presumably the shop is black because it is a blacksmith shop, and the public has a well founded idea that the blacksmith is supposed to have cats' eyes. Ask the blacksmith why he puts up with conditions of this sort, and he will reply that he is too busy to fix up. Ask him how he manages to get along with such tools and probably he will inform you that he has asked to have them renewed, possibly has made his request several times, but has been told that there was no hurry until the spring, when the repairs would begin. This putting off repairs until the spring is a great mistake in many cases. When the sawing is about to begin it will probably be too late in quite a number of important cases to have the repairs or renewals attended to as thoroughly as they should and have the mill ready for operation when it is required.

Cleanliness is Infectious

Is it not astonishing how often one comes across these distressing conditions in connection with a sawmill? As a matter of commonsense, practically anyone would know at a glance that the results of this indifference and carelessness must be serious loss, and that ordinary business-like methods would do away with all this difficulty at practically no expense worth considering. There are, fortunately, many notable exceptions to this situation, but on the other hand there are far too many cases in which these conditions exist to a greater or less extent. There seems to be something about the atmosphere of a sawmill, or the make-up of those engaged in operating it, which leads regularly to these results unless a definite practice is made of keeping everything continually cleaned up and in good shape. It is all the more important, therefore, that the manufacturing lumberman should make a fight against this tendency. Unless this is done there is sure to be great deterioration, equipment of every description going more or less to rot before notice is taken of existing conditions. Apparently, the offenders in this connection travel along the line of least resistance, having an idea that anything is good enough for a sawmill, and especially for an old sawmill; whereas ordinary business intelligence would convince them that they ought to give this matter more attention almost than they give to the selling of their output. The up-keep of the mill is, in fact, the place where the general business course of any lumber manufacturer will take its most definite step towards success or failure. A good example set at this stage of operations will produce not only efficient manufacturing conditions in the plant, but an infectious cleanliness and care about all the business methods of the company.

Nowadays, when the labor market has been so greatly disturbed by the enlistment of large numbers of men for overseas service, it is a more difficult matter than ever to maintain a clean mill, but it is none the less important to do so, so far as possible. Every day, in fact continually throughout the day, the operation of the mill should be accompanied by a continual fight against the accumulation of debris and dirt. Then, at the end of the year's operations, as soon as the last log has been cut in the fall, the mill should be given a complete clean-up. This will prevent great loss; it will reduce depreciation; it will almost eliminate the fire risk; and it will leave very little to be done the following spring when operations are to be resumed. It will, in fact, save many a dollar for the lumber manufacturer.

John Austin, head of the firm of J. Austin & Sons, Kinmount, Ont., died recently at his home.

B. C. Lumber for Eastern Canada Markets

Its Special Qualities of Strength, Variety, Beauty and Cleanliness, Entitle It to a Greater Share of the Trade.

IN considering the question of domestic markets sion of Canada's industries will prove helpful. for Canadian products, a brief survey and divi- Canada's industries may be said to be located as follows:—

Eastern Canada--Manufacturing, mining, lumbering.
Prairie Provinces—Farming.
Extreme West—Lumbering, mining.

Both east and west have industries other than those mentioned, that are common to both, such as farming and fruit growing. The mining industry accounts for a very big slice of Canada's wealth and operates in both the east and the west.

Eastern Canada, the most thickly populated portion of the Dominion, produces the great bulk of the manufactured articles for the use of the remainder, while the far west province of British Columbia has a stock of raw material in lumber sufficient to supply all Canada's needs and, indeed, those of a considerable portion of the world besides. The prairie provinces are the great common consuming market for the manufactures of both Eastern Canada and British Columbia. In addition to this common market, British Columbia and Eastern Canada carry on a moderate trade as between themselves, the balance being largely in favor of the east. We propose to deal in the following brief remarks with the British Columbia lumber supply and the Eastern Canadian lumber requirements, under the following heads:—

1. The ability of British Columbia to supply lumber of the highest quality and unlimited quantity.
2. The requirements of Eastern Canada in lumber.
3. Why Eastern Canada should buy British Columbia lumber in preference to imported lumber.

Before dealing with the first of these considerations, let us look for a moment into the available native lumber in Eastern Canada. The stands of high grade lumber in Eastern Canada are fast becoming depleted, especially in timbers where strength is required and a high clear quality of finish is sought. The clear grades in eastern pines are at a prohibitive price for ordinary work. Eastern spruce has neither the strength or size required for structural work. Eastern hemlock is largely used in small dimension stock, but only for the reason that it is wood and comparatively cheap, certainly not on account of its high quality and suitability for building work. The east, therefore, not having in large quantities at low prices a supply of native woods with strength values and finish qualities demanded by good modern construction must turn elsewhere for the supply which their own woods cannot fill.

Our wideawake friends south of the line, ever ready to fill any requirement in any commodity in any market, realized that here in Eastern Canada a splendid market awaited them. Thus, without delay, the Southern pine manufacturers quickly built up a large connection in Eastern Canada. Georgia pine was laid down at various points in the east at prices which appeared to defy competition from the distant British Columbia woods.

The Dominion Government returns for values of imports for the years 1913 and 1915 in pitch pine lumber, rough sawn, and lumber and boards dressed one side, all from the United States, are as follows:

	1913.	1915.
Pitch pine, rough sawn	$2,435,376	$1,608,788
Dressed one side	6,089,548	2,322,368
Totals	$8,524,924	$3,931,156

The returns are given for 1913, as that year represents a year of normally good business, while 1915 represents a year of abnormal business conditions resulting in a very small consumption. Surely, in the space of twelve normal months, Canada should not import over eight million dollars' worth of a raw material that she has in such abundance and excellence within her own borders?

The figures given above are for softwoods suitable for building and construction purposes which entered this country free of duty (except the 7½ per cent. war tax). The figures do not include shingles or any hardwoods.

L. B Beale

The Department of Public Works of the Dominion Government have lately issued instructions that Canadian woods only are to be used on public works. Similar orders have been issued by the Canadian Pacific Railway for their work. These orders combine sound business and patriotism and might well be emulated by all Canadian users of lumber.

The Ability of British Columbia to Supply Lumber of the Highest Quality and Unlimited Quantity

The stand of merchantable timber in the province of British Columbia is estimated to reach the enormous total of four hundred billion feet B.M., which is over half the total of all Canada. British Columbia has vast stands of Douglas fir, the most important timber tree on the North American Continent. No other one species exists in such great individual sizes, such excellence of quality and such vastness of quantity. This wood is equally well adapted for the most exacting work in modern engineering practice, the usual forms of building construction, and the highest form of interior finish. Probably no other wood has so wide a range of usefulness. Average results of tests show that Douglas fir possesses higher strength values than longleaf southern pine, or any other commercially available soft woods.* One outstanding feature of this wood is its increase in strength with seasoning. This increase amounts to some 30 per cent. to 35 per cent. In this respect it is far ahead of Southern yellow pine, which does not appear to increase in strength values with seasoning.† There is no condition of use or service in which B. C. Douglas fir is not equal or superior to Southern yellow pine. The writer lately heard an interesting address by a prominent Canadian engineer. In comparing Douglas fir with Southern yellow pine for heavy construction, the speaker said, "I will always use Douglas fir in preference to Southern yellow pine for the following reasons: It is a better wood, a stronger wood, a lighter wood, and it is produced in Canada." This sentence is a terse, clear statement of reasons for preference in Douglas fir, that are the result of long experience in wood construction. The largest sizes called for in modern engineering practice are easily filled by B. C. Douglas fir. Equally well can this wood supply the demand for all kinds of lumber for railroad work, building construction and the best class of finish. This is a unique record for one wood, a record that justly entitles it to the name of "The Universal Wood."

Douglas fir, however, is not the only wood British Columbia produces. western red cedar, western spruce, western hemlock, western white and soft pine and western larch grow in abundance and in very large sizes and high qualities. Space does not permit of a detailed description of the character of these woods. Their qualities cause them to be in demand for a wide variation of uses from shingles to shipbuilding, factories to food containers, farm buildings to implements, mansion to cottage, in fact for every use to which wood can be put. Truly, British Columbia has "A wood for every use." Moreover, the mills of the province are equipped with modern and efficient machinery enabling them to manufacture their lumber to satisfy the most exacting requirements and they are prepared to manufacture their forest products to meet the special requirements of any market.

The Requirements of Eastern Canada in Lumber

The lumber requirements of Eastern Canada can in part be satisfactorily filled by her native woods. Such requirements demanding wood for pulp and paper making, boxes, crates, cheap forms of dimension stock for small buildings, some veneers, hardwoods, and some other items Eastern Canada is well able to supply from local sources.

Eastern Canada's lumber requirements in engineering work, docks, wharves, heavy construction, buildings of mill construction, high grade floorings, residence work of the better sort, and so on have to be supplied with lumber from beyond her own borders. Go into any large lumber yard in Ontario and you will find stocks of imported Southern yellow pine and other imported woods, to fill such requirements. Those stocks can be filled better with B. C. woods at prices

* See U. S. Forest Service Bulletins Nos. 88 and 108.
† See page 20 and 21 U. S. Forest Service No. 28.

which compare favorably with any wood of similar high qualities. A closer business relationship between British Columbia mills and Eastern Canadian lumber dealers will greatly aid the "Made in Canada" movement. In this connection a point may be mentioned regarding "Canadian Products for Canadian Consumption." The writer has recently visited several lumber yards, factories, etc., in Eastern Canada and in many has seen the following notice displayed in a prominent position in the office: "By buying goods made in Canada, you help the other fellow keep his job and he helps you keep yours." This has a good patriotic-standing-up-for-our-own-products kind of sound. A visit to the yards adjoining the office, however, frequently reveals the presence of large stocks of imported woods in many cases inferior to our own products.

Why Eastern Canada Should Buy British Columbia Lumber

In a country of such vast extent as Canada, the value of the products of any particular part or province vary with the transportation facilities for reaching a market. Until recently, but one transcontinental line was available for Coast to Coast transportation, but with three lines now operating, many products hitherto unknown in the east as marketable commodities, are able to reach consumers. The trade relations of British Columbia and Eastern Canada are on the eve of great expansion in many lines, due to the additional railroad facilities and the availability of the Panama Canal. The haul of nearly three thousand miles by railroad is a considerable item on such bulky products as timbers, and it is anticipated that transportation by water will cut freight rates to perhaps one-half of the existing railroad rates. This will enable points in Eastern Canada available to vessels of moderate tonnage, to obtain shipments of B. C. products at much lower prices than now, and will tend to make such ports distributing points for the inland eastern districts. Any comparison of freight rates by water and rail must be based on normal shipping rates and such rates will not obtain until some few months after the war is ended. The existing freight rates by rail, however, do not prevent B. C. woods from entering Eastern Canada at favorable competitive prices.

Industrial expansion in all Canadian industries will surely occur with peace and the requirements of the countries in which war has been waged. With the war over, it is not difficult to foresee that Canada will have trade opportunities unsurpassed by any other country. Her population will be increased by the influx of thousands of people from the old world. This will mean tremendous demand on Canada's manufacturing plants, and it is Eastern Canada that will get the lion's share in the manufacturing industries. One of the sure results of this huge trade in Eastern Canada will be an increased demand for lumber for all kinds of buildings. Many kinds and qualities of lumber are or can be used in the same building. The structure requires timbers of certain strength, durability and wear resisting qualities; some parts demand beauty in grain and figure while other parts can be supplied by almost any kind of wood. British Columbia, alone of Canada's provinces, has lumber in unlimited quantities which combine the qualities of strength, resistance to wear, durability and beauty to a degree unequalled by wood from any other part of the world. In the natural order of things, all Canada should, therefore, obtain that portion of her lumber needs, which cannot be supplied locally, from British Columbia. As a matter of fact, Canada does not do this, as far as the East is concerned. A very large proportion of Eastern Canada's wood for building work is imported. This imported wood has neither the strength values or beauty of many of our own Canadian woods. The reason for this apparent injustice to our own woods is difficult to place at first glance, but investigation will show us the cause.

Canada is yet young in her existence. Her birth industrially and every other way occurred in Eastern Canada and her expansion has been westward. But while the growth has been gradually developing through the West, the trade of the East has expanded to a very big thing in order to supply many of the needs of the growing West. This trade growth in the East resulted in large increases in population, larger factories, more homes and consequent demand for building materials. Building material is composed very largely of lumber. Canada had lots of lumber in the far West but little was known in the East of its qualities and it is probable that ignorance of the qualities of B. C. lumber has, in the past, been largely responsible for its comparatively small demand in Eastern Canada. A better knowledge of the qualities of B. C. woods has resulted in an increased demand for B. C. forest products in Eastern Canada from engineers, architects, and the general public in Eastern Canada will, it is hoped, aid their far western brother lumbermen in filling this demand. To do this successfully, stocks of B. C. woods must be held for immediate delivery, just as similar stocks of Southern yellow pine are now held. Present prices of B. C. woods are favorable and, indeed, in many cases lower than Southern yellow pine, freight paid to eastern points.

B.C. Shipbuilding Bill Discussed

Important Measure Introduced to Promote Export Lumber Trade.

During the discussion upon the shipbuilding bill in the B. C. Legislature on May 5th, Mr. H. B. Thomson (Victoria), made a number of interesting statistical statements about the industry. He said that B. C. coast mills have a capacity of 700 million feet of lumber annually. Of this, 280 million feet was available for export. This 280 million feet of lumber could not be shipped to the large overseas markets unless the Government furnished loans to shipbuilders and paid a bonus for the operation of the vessels. In referring to overseas markets he stated that the Australian market could take $10,500,000 worth of lumber, New Zealand $2,500,000, South Africa $6,000,000, and that large quantities could also be taken by South America, India, Japan, The Straits Settlements and East Africa. At present, on account of lack of vessels, Canada was selling only $265,000 worth of lumber to Australia, whereas the United States, which had a fair supply of vessels, was selling $7,000,000 worth in that market, Norway and Sweden were selling $420,000 worth, and Russia $323,000 worth. In addition, Australia was buying $140,000 worth of box shooks, of which 80 per cent. was supplied in normal times by Germany, Sweden and Norway, and practically none by Canada.

British Columbia at the present time, Mr. Thomson said, was in the position of a grocery store which was trying to run its business without a delivery wagon. At present, British Columbia lumbermen were being charged in the neighborhood of $1.50 a thousand feet more than Washington and Oregon lumbermen had to pay, because present tonnage charters from British Columbia ports were controlled by Americans.

The bill introduced in the Legislature provides for the appointment of a Shipping Credit Commission with power to loan money for the construction of ships; to subsidize ships when constructed, and to guarantee interest upon the bonds of shipbuilding concerns to the extent of 6 per cent. It is stated that the Government has already received offers from legitimate dock yard companies that are willing to proceed with the construction of large graving docks at once and to build vessels therein. Other shipping men are said to be ready to operate the vessels out of British Columbia ports carrying British Columbia lumber and produce as soon as the construction of the ships has been completed.

The Shipping Credit Commission will be composed of two directors and a superintendent, all appointed by the Government, with the Deputy Minister of Finance an ex-officio member. The Commission will borrow money through the Government and lend it to shipbuilders at 6 per cent., to be repaid within five years, one-fifth at least every year. Each loan is to be limited to 55 per cent. of the value of the ship, which must be built and registered in British Columbia. The Commission is to take a first mortgage on the whole value of the vessel, and is to be managing owner until the loan is repaid. The vessel must not leave the British Columbia trade until the money has been repaid to the Government. A special clause in the bill states

that owners of the vessels must not charge a larger freight rate than is prevalent for similar commodities in the State of Washington. The measure applies only to ocean going vessels upon which construction is commenced within one year from the passage of the bill.

In regard to bonuses, the bill states that vessels up to the number of 20 may be bonused to the maximum extent of $5 a ton per year for a period of ten years. The subsidizing provision, however, will apply only after the war, when a reduction in the earning power of the vessel is likely to occur. No vessel is to benefit by the subsidy proposal which is earning 15 per cent. interest for its owners. Deep sea craft at present are making at least 20 per cent. and in many cases over 100 per cent. per annum. For a ten year period, commencing one year after the conclusion of peace, the Commission will make up any deficiency between the ship's earning capacity and 15 per cent. of her actual cost. The bill guarantees 55 per cent. of the actual cost of constructing shipbuilding, repairing and docking plants in British Columbia, by guaranteeing interest at 6 per cent. upon the bonds of such plants.

Shipbuilding and Export Trade

Grading and Tallying Bureau Suggested as a Government Undertaking—The Tonnage Problem.

Editor Canada Lumberman:— Victoria, B. C.

"The Government of British Columbia contemplates speculating the sum of two million dollars in an endeavor to foster the lumber industry by financially assisting a shipbuilding industry. I use the word 'speculating' advisedly for the reason that it was publicly stated that wooden ships to carry lumber would result in those ships earning 100 per cent. per annum! Considering that in British Columbia we have so little experience in building wooden ships, and that there are people on the Pacific Coast of the United States who have been a generation in the shipbroking, ship-owning and shipbuilding business, who are not to any large extent building ships to earn these enormous dividends, the spending of two million of dollars savors more of a speculation than an investment.

"There is no question, and there never has been a question as to whether British Columbia should do a large export lumber trade. It should do four times the trade of the United States Pacific trade, for the reason of Great Britain's mercantile marine. There is no question as to why British Columbia has not had its fair share of the export trade, the reason is obvious; British Columbia has had to buy its freight through its competitors in the United States.

"A large proportion of the standing timber in British Columbia is American owned or controlled, American standing timber has heavy carrying charges. A group of financiers controlling both American and British Columbian standing timber would naturally use all their endeavors to cut their American timber in preference to their British Columbian timber.

"The leading people in the British Columbia Lumbermen's Association, those who have the ear of the government, and the Boards of Trade, represent mills that are controlled by American capital. These mills get the greatest proportion of the small export trade that British Columbia is allowed to have. Most of the British-owned lumber mills are closed down.

"Building ships to the value of two million dollars would mean a carrying capacity of 30,000,000 feet b.m. per annum. The American ship brokers last year, even while the abnormal conditions of war obtained, secured freight for more than three times this amount for shipment to just one British colony—Australia. Shipbuilding under present conditions of labor and finance will not immediately foster the export lumber trade. The natural evolution is from ship broker to ship owner, and ship owner to shipbuilder.

"The British Columbian British millowner wants to be in a position immediately to obtain freights on equal terms with his competitor, and only the government can assist him to do this. There is no monopoly in freights, there is gambling in 'futures,' but all freights are open to competition, and are mostly handled in London. The big shipping men in San Francisco all have their branch houses or agents in London, and are in cable communication daily with all freights offered or ordered.

"Under present circumstances no individual export lumberman can expect to compete with these old-established firms operating their ship-broking business on the Pacific Coast, but with the assistance of the British Columbia Government they can be on equal terms or even better terms than their American competitors.

"The government should be 'in loco parentis' to the export shipping trade. A department should be established in London controlled by a man experienced in the shipping trade in London, to arrange that the British Columbia exporters should be daily posted as to what freights are offered to the different ports of the world. The expense of establishing a department such as I suggest would not be a fraction of the expense at present incurred by the Department of Trade and Commerce in endeavoring to help the export lumber trade.

"It is not necessary to establish resident commissioners, or send them round the world to talk on the merits of Douglas fir—our American competitors have done all this pioneer work, and an india-rubber stamp 'guaranteed equal to Oregon pine,' and the grading and tallying of British Columbia lumber by a British Columbia lumber and inspection bureau would do just as well. In fact, it would not be long before American competitors might have to use the india-rubber stamp to say, 'guaranteed equal to Douglas fir.'

"The British Columbia Government should immediately establish its grading and tallying bureau, it costs nothing. In America the bureau actually makes a profit out of its fees.

"Two years ago I pointed out to the Victoria Board of Trade that a British lumber mill, shipping British timber, in a British ship, financed through a British bank to a British firm in a British colony, had to go to an American concern and have their lumber graded and tallied. Two of our most prominent lumbermen strenuously opposed the suggestion of establishing a British Columbia lumber and inspection bureau. Out of curiosity I looked up the shareholdings of the two companies these gentlemen represented. One company had more than 90 per cent. of its shareholders residing in different parts of the States, the other was controlled by an American company whose shares were seemingly all held in the States.

"Fair competition is healthy. I do not even blame our American competitors for attempting to throttle the British Columbia export lumber industry, and cut their expensive American timber first. Their British Columbia holdings of timber can wait, they have small carrying charges. In the meantime, however, the British Columbia export trade is going back every day. A few special orders were obtained last year for export to the United Kingdom (and they were mostly placed with American controlled firms), but British Columbia is not getting anything like its proportion of business. It can not secure freights in fair competition, because it is not equipped to compete for these freights.

"In the month of February there was shipped from the Pacific Coast 13,000,000 feet of lumber to British ports, of that British Columbia shipped 392,000 feet, and that in a Japanese bottom!

"Even if miracles were possible, and the British Columbia Government arranged to build and launch a ship within three months, and one each month afterwards, what benefit would that be to British Columbia from the lumber industry point of view. When this war is over 30,000,000 feet per annum will not represent perhaps one per cent. of the business offering. We should be establishing now on a sound commercial basis with a ship-broking department in London, efficient codes, properly arranged finance, and our own inspection bureau.

"It wants a shipping man experienced in the different markets of the world to inaugurate this department. The qualification of being a good Conservative, a good Liberal, a good forester, a good lumberman, or a friendship with a patronage committee are not sufficient. It wants originality in idea, initiative in action, boldness of thought, the backing of the government, and chartering experience.

"Our lumber industry is not meant to foster a shipbuilding industry, that might come later, when we have established our export lumber trade. The immediate work on hand is to find employment for so many of those twenty thousand men who will be spared to return here after fighting our battles. Not to waste our time in legislating during the absence of these men, by pandering to cranks, jeopardizing our independence to save a few alcoholic degenerates, and admitting our police are incapable of enforcing the existing liquor laws.

"We have no time to worry about prohibition or shipbuilding. There is work to be done in British Columbia, and the most important work is to put our export lumber industry on a firm commercial basis.

"There is the right way of doing this: Buying our own freights and grading the exports ourselves. There is the wrong way, that of having our trade controlled by our competitors.

"Not twenty miles from Victoria is a British-owned lumber mill, that three years ago was equipped for export trade with all modern machinery at a cost of between two and three hundred thousand dollars. The new machinery has never been started—the pity of it!

"British timber, British graded, British shipped, British financed, to British markets is our heritage, and that heritage must not be sold to the foreigner for a mess of political pottage."

HENRY PEARCE.

E. H. Newton, Vancouver, B. C.

Vigorous Handling Badly Needed

Business Conditions in the West Require Men Like Those Who Have Operated Successfully in Eastern Canada

In considering the possibilities and probabilities with which lumbermen seem to be confronted at the present moment, and in commingling our prospects for the immediate future with thoughts of the past, we find that we have much to hope for, and also many things to regret. If in supplying these few thoughts for the Annual Number of the Canada Lumberman I only could omit some of the things which I feel impelled to say, I know that I could furnish you with an article which would make pleasanter reading, and perhaps have the appearance of being very much more superficially correct, but if I did this I would not be true to my own convictions, nor to the cause in which I have spent so many years in constant study.

The lumber business today may be likened unto an invalid who is suffering from a complication of deep-seated diseases. He finds on every hand plenty of lotions and local applications, and plenty of practitioners who are anxious, for personal gain, to try this, or that remedy, but none of them do any good; they do not reach the cause of the trouble, and therefore only aggravate the malady and weaken the patient. Wiser and more experienced physicians, figuratively speaking, examine the patient; they know the true cause of his suffering, but they shake their wise old heads and pass on. Perhaps they have decided that the case is hopeless, or it may be that they have prescribed for this patient before and know that he will not take their advice nor follow their instructions, and consequently rather than risk their reputations, they cultivate other ambitions and leave their profession, which is so much in need of good men, and go into other occupations, savoring more of the qualities of proportion commensurate with high ideals than does the lumber business of today. Many good and capable men of seniority have thus left our ranks in recent years, and who can blame them? Surely, approaching Heaven from the present level of the lumber business is sufficient cause for apprehension, and who can blame anyone for seizing any extended rope that seems to lead to a higher level?

Down Beside a Shady Pool

I remember, in my childhood days, playing for hours at a time by the side of an almost stagnant pool, and as I watched from the sloping banks the dancing, glittering ripples stirred by the gentle breezes on the surface of that pool, as the glorious sunshine from an azure sky shone down upon them, my childish heart filled with joy and gladness. How perfectly grand, and supremely beautiful, and how genuinely satisfying it all was to my childish nature. I did not look, nor even think, beyond the surface of that pool, and had my childish mind been able to have done so, it would have spoiled the picture which I have carried unto this day, and which is so vivid in my memory. Then again, as the day became spent, and I had benefitted nothing except from the feastings of my imaginations, the programme changed. The ripples ceased, and music by a choir of probably many thousand voices was heard in the distance as I turned from the scene. There were some very long and grating voices which made me shiver, for I had conceived the idea that their owners were very large frogs, and probably owned the pool. I have since learned that this was a mistaken childish idea, and that the loudness of the noise does not always indicate the size of the frog making it. However, the frogs in that pool all wanted to talk at once, and each seemed to try to drown the voice of the other, and as near as my childish mind could interpret them they were all of different opinions, and sometimes a sudden splash in the water would indicate that they were ready to enforce their opinions on a neighbor if his agility had not taken him to safety. I don't know to this day who they were addressing—it may have been me, but here are some of the things they were saying: "Go Around," "Cut across," "Knee deep," "You'll drown," "Wade in," "Stay out you chump."

A Ripple on the Surface Now

It is not my intention to insinuate in this article that the lumber business is a pool, nor yet that those engaged therein are frogs; neither do I wish to be interpreted as sounding the gong of pessimism. There is at the present time, however, a "ripple" on the surface of the lumber business which has, I fear, brought about an unwarrantable feeling of joy and optimism to the minds of those engaged therein, while from the "banks" it can probably be seen that it is only a ripple on the surface.

Now I would not have anything done to disturb this ripple, but let it dance before us in all its splendor, and in all the brightness of anticipation that can be reflected from it, but I would not have any one deceived by the belief that it is going to develop immediately into a big wave, for such is not likely to happen. All we have got to do in order to settle this matter in our minds is to consider our prospective markets, and what has to be done before we can reach them; or let us consider our home building, and where are the young men gone and going who are going to build these homes? Still, courage is one of our grandest assets, and it is good to see so much of it being exhibited in the land today. Courage is not dangerous. Rashness is. If I had gone down into that pool of my early recollection, and floundered in its stagnant waters and drank copiously of them, I might not have an existance today; but I didn't do it. I got as much of it as was good for me, and no more, and this is my advice to lumbermen today; get as much of the business as is good for you, and no more. Let your neighbor have some of the good things, for if you try to get them all he is liable to raise his voice in an inharmonious sound which is sure to break any semblance of unison that there might appear to be.

An Endless Serial

Lumbering in British Columbia affords a subject for an endless story, which, like the words of Holy Writ, may be told and retold, and never grow old. It is a subject which has more interest for the average British Columbian than any other industrial interest at the present day, and therefore it may be told over and over again, and the light of discussion so reflected that it will brong out before the listener-reader many different phases which have hitherto not been reflected. The lumbering industry in this province is one which means more to British Columbia, if not to the whole of Canada than any other of our five great industries, the other four of which are mining, fishing, agriculture and commerce, and therefore is a subject worthy of all the discussion and consideration which has hitherto been spent upon it by the best minds.

The application of principle by which the manufacturing and merchandising of lumber is controlled should be scientific in the true and logical analysis of the word. A game that is worth while, if it is to be played successfully must be understood, and so it is with this industry. There are no great mysteries about it, but it does extend to and take its root from depths beneath the surface, which can only be reached by close application and scientific study of both principle and practice. The one great trouble with the lumber business as it is conducted today is that there are too many in the business who are working by guess and by "Gaston." They guess they are right, and by Gaston when they have transacted the business they find they were wrong.

"There's a Silver Lining"

Despite the foregoing phases of the situation, which we greatly deplore, but upon which I will not dwell further in this article, it is much easier for a man who does not wish to bear the stigma of being a pessimist to discuss the lumber business today than it has been for some time, and for this we are all very thankful; I know we are. This condition of affairs, which puts words in our mouths which can be truthfully spoken today, but which would have had but little meaning a year ago, has been brought about by that one great and mightiest of all agents—energy. Some people seem to think there are different kinds of energy, but this is a mistake. It is the same energy, but differently applied. Energy may lie inactive, or it may be irrepressibly employed. It may be directed in various ways, and with varying results, but it is the same energy and comes from the same source. The energy that makes the world go round is the same energy which is behind the lumber business in this province today, and if carefully and properly applied it is going to make the business hum in spite of all its afflictions. Energy may be constructive or destructive, corrupted or perverted, but disguise it as you will, it is the same power which dominates the great forces of yesterday, today, and for-

ever. It is God-given, and neither man, Kaiser nor devil can kill it.

We are being forced on, even beyond our most sanguine hopes of a year ago by this great and all powerful agent which evolves all good things, and the evolution is already beginning to give us glimpses into the future that are very gratifying. Things are looking decidedly better, and unless we do something that will bring a blight upon our prospects by some irresponsible act committed without due deliberation, there is a brighter future, which ought to be made a reasonably profitable one, now lying before us, and while we have in the past, with all due reverence said, "Give us this day our daily bread," we hope that in the future we may be able to have a little butter on it. I cannot pass from here though, without sounding a word of warning, for a great danger is imminent. A great revival is upon us. Not great perhaps in the sense of proportion in which we have been accustomed to consider greatness in past years, but great because of the mighty hidden power which is forcing it upon us in the face of all obstacles. You might as well try to turn the tide as to stop this force; not even the Kaiser and all his hell-bound forces have been able to do it. It will take its course, but will do no harm, so do not get excited. I sound this warning because there are some people to be found in a revival of any kind who are not rooted beneath the surface, and who lose their equilibrium so easily that they not only make themselves appear riduculously irresponsible, but their acts may result in untold injury to others.

Judgment was handed down recently in the Supreme Court of Nova Scotia, deciding that all men who are engaged in the lumber business are not necessarily lumbermen. The judge giving this decision, if he has never been engaged in the lumber business himself, has at least some powers of discovery, as well as the courage of his convictions.

We sometimes hear the remark that "competition is the life of trade," but I never could quite concur in this statement without qualification. Healthy competition may give a stimulus to trade, but blind competition is sure death every time, and the worst and most miserable of all deaths of this nature is when a man is his own executioner. Even though he may pull others down with him, wherein is he benefitted? "Ah," he says in frenzied excitement, "but we kept those fellows on the other side out anyway, even though we didn't make anything ourselves." Would it not be infinitely better to have maintained a price that would have enabled them to have sent a few cars in, than to have used such methods as we have used in the past to keep them out? Let us remember the lesson of the dog and the shadow, and be satisfied with a fair prospect of making a little profit from a reasonable volume of business.

It has been said that a certain number of fleas are good for a dog, but the dog did not say so. If he could be heard he would doubtless tell a different story. He not only finds them a nuisance, but they are sapping his strength. Blind competition such as we have seen in the lumber business is just as good for the business as fleas are for a dog. If we were working only for the good of our health, and to develop muscle, then nothing could be said against some of the methods which we so often see employed. The trouble is, though, that we are looking for more, and it is also costing us more to look. We pay 20 to 30 per cent. advance on belting; 40 per cent. on nails and tool steel; 20 per cent. on truck tires; 10 per cent. on saws; 100 per cent. on bolts, washers, iron and soft steel; 400 per cent. on high speed steel for planer knives, etc., and will, if we are not careful, before the season is out be paying 50 per cent. advance on much of the labor used, because if an unwarrantable demand is made upon it the supply will be found limited and very inefficient, and the disturbing element will be set at work.

The man who proposed government regulation of prices in the lumber business of this province, and jail for the man who broke them, has certainly had enough to provoke him to wrath. Let us hope, though, that no such extreme measure may be required, but rather that we may begin upon a new era, and that in performing the obsequies of the past, all those old traits of irregular procedure may be placed upon the funeral pyre.

Geo. Gordon & Company's New Plant

Less than a year ago, or to be exact, on July 19th, 1915, the large sawmill at Cache Bay, Ont., belonging to Geo. Gordon and Company, Limited, was destroyed by fire. Today, the company is operating a fine new mill, illustrations of which are published herewith. With their characteristic energy, the company lost no time in preparing plans for the new mill and in having the construction commenced. The result is a splendid new mill with every modern equipment.

The main mill is 58 ft. by 172 ft., and its equipment consists of the following:—2 double cut band mills (Waterous Engine Works Company, Brantford, Ont.); 1 horizontal band resaw (Diamond Iron Works, Minneapolis, Minn.); 1 72-in. edger (Diamond Iron Works, Minneapolis, Minn.); 1 extra heavy carriage (Diamond Iron Works, Minneapolis, Minn.); 1 extra heavy carriage (Wm. Hamilton Company, Peterboro, Ont.); 1 gang edger (Mowry & Sons, Gravenhurst, Ont.); 2 lath machines (P. Payette & Company, Penetanguishene, Ont.); 2 bolters (P. Payette & Company, Penetanguishene, Ont.); and 1 picket machine.

The trimmers, steam feed, kickers, loaders, slash table, shafting and pulleys were supplied by the Waterous Engine Works Company.

The engine room is 26 x 43 ft., with solid brick walls, tar and gravel roof. It is equipped with one Nagle Corliss engine 24 x 48. The boiler room is 53 x 45 ft., with solid brick walls and corrugated iron roof. It contains 4 boilers 72 in. x 16 ft., 1 boiler 66 in. x 16 ft. and 1 boiler 60 in. x 16 ft.

The locomotive house is 28 ft. x 98 ft.; a frame building with tar and gravel roof.

The machine shop, blacksmith shop and boiler room are 53 ft. x 49 ft., a frame building with the exception of the part which is used for the boiler room, the latter being of solid brick with tar and gravel roof covering the whole building. The boiler room in connection with the machine shop contains 1 boiler and a dynamo which supplies light for the mill and the planing mill, and light and heat for the locomotive house, machine shop, office and store.

The Cooperage Industry in Ontario

By J. Innes

THE manufacture of cooperage stock in Ontario is one of the oldest industries we have. So far as I can learn, the first slack barrel staves that were manufactured under the present system were made at Iroquois, Ont., in 1862, by Mr. Patton, this being the earliest record we have of staves being manufactured with the concave knife. Before that large quantities of slack barrel staves were made in Ontario by hand, from red oak, by splitting the staves from bolts and then hand-dressing them, the same as white oak staves were hand-dressed in England until very recently. In fact white oak staves are still hand-dressed to quite a large extent in England and on the Continent, by using in-shave and out-shave knives.

Since 1862 the manufacture of cooperage stock in Ontario has developed into very large proportions, the high production lasting from 1884 until about 1910, when the timber (more especially elm timber), began to be scarce, and the production commenced to decrease. Probably the high-water mark was reached in 1890, when there were several mills at nearly every station in Kent, Essex and Lambton counties, and a great many mills at other points, which are now out of business. At the present time, the business is widely distributed over Ontario, and while there are not the number of mills there were in 1890, and the production has decreased, the business is still a very important one, and requires a large number of men, both in the woods and in the mills.

While the favorite timber for slack barrel staves is elm, which is the only timber to amount to anything that is used for hoops, and while basswood is the favorite timber for heading, staves are manufactured from birch, maple, poplar, basswood, beech, ash and spruce, and heading is manufactured from basswood, poplar, elm, maple, beech, birch and spruce. The highest priced staves are elm, and they are the most satisfactory staves to work. The only hoops that have proved satisfactory are elm hoops, when made from logs, but quite a large number of bark hoops are used, made by splitting and dressing small saplings, principally hickory and oak being used, although chestnut and white ash make good hoops. In heading, while basswood is the easiest to work, almost any of the native timbers in Ontario, if properly treated, will make good heading for any purpose, and as basswood is becoming very scarce, I believe that birch is the coming timber for heading.

Lumbering in the cooperage business is done, to a very large extent, by farmers, who can employ their teams in the winter, when they have nothing else to do, but the large cooperage concerns supplement the farmers' work by employing numbers of teams of their own, and almost invariably use their own cutters in sawing down the trees. As the timber is getting scarcer, and farther away from the mills, a great deal of it is railed in, or brought in by water, in the shape of logs or bolts. Very few of the concerns now manufacturing cooperage stock own large timber limits. The timber is mostly owned by settlers, and is for sale, standing in the woods, or delivered to the mills or railroad. On the logs or bolts arriving at the mills they are manufactured into staves, hoops and heading.

Handling Stave Logs

For the manufacture of staves, the logs are put through the sawmill and made into bolts. The bolts are then put into the steam-boxes, steamed for twenty-four hours, so as to make them soft and cut easily, and then cut on a stave knife, which cuts on a 20-inch circle, five staves being cut out of each 2 inches of the bolt. The staves are then piled on the yard, or in sheds, to season. After being seasoned they are jointed with a diamond-shaped knife, which puts on the required bilge, and are packed up in bundles of sixty staves each (graded according to quality), and are ready for the market.

The hoop logs are taken into the mill, sawn into hoop plank, 1½ in. thick, and whatever length is required for the particular hoop

Stave and hoop mill at Sundridge, Ont.

One of the Sutherland, Innes stave and hoop mills.

that is to be manufactured, the standard hoop being 6 feet in length. These plank are then put in boiling vats, and boiled from twelve to fifteen hours. They are then taken to the cutting machine, which cuts the hoops, six hoops to 2 ins. in thickness. The hoops are then stood on end to cool off and after being thoroughly cooled are taken to the planers. The planers plane the hoops a uniform thickness, putting on the necessary finish, and they are then carried from there to the pointer and lapper. The pointer and lapper puts the point on the hoops and the other end is thinned to what is called the lap. From there the hoops go to a vat, where they are again boiled so as to make them flexible, and from there they are taken to the coilers, where they are coiled in coils of ten hoops each, and after being piled in the sheds to dry they are ready for shipment.

The Manufacture of Heading

Heading is manufactured either from logs or bolts. If it is manufactured from logs the logs are run through the mill and reduced to bolts. The bolts are taken to the slicer, which slices them into boards, 5/8 in. thick, and in most cases they are taken from there and piled in the yard for seasoning, although in some mills they are taken direct from the slicer and piled in the kilns and kiln-dried direct from the slicer. The ordinary way of manufacturing here is to pile them in the yard first, and season them for about sixty days. They are then taken from the yard and piled on cars in the kiln, where they are kiln-dried, from thirty-six to seventy-two hours, according to how well air-dried they have been. From the kiln they are taken out into the open, where they are left for twenty-four hours to cool off, so as to be tempered. They are then run through the planer, and planed off on one side, and from there to the jointer, which straightens the edges of the boards, and from there to the matcher, which matches up the boards to the necessary width for the size of heading that is to be turned. From there they go to the turner who turns them whatever size is demanded by the customer. After leaving the turner they go to the packer and are put up in bundles of twenty sets each, packed by a power press, and bound with heavy wires or iron bands, when they are ready for shipment.

Head liners in Ontario are mostly manufactured from parts of hoops which are too short to make good hoops, and are run through a planer and then packed up in bundles of 250 each, and after being piled on the yards and seasoned they are ready for shipment.

The stock, after being manufactured at Ontario mills, goes to markets practically all over the world. While a large part of the stock manufactured is consumed in Canada, shipments are made in large quantities to Europe, more especially to the British Isles and the Mediterranean ports, and here we might say that the present war has created a demand from Mediterranean ports for large quantities of stock which formerly used to be supplied from Austria, Germany and Russia. The principal export market, however, is the United Kingdom, as, on account of most other countries making staves, in a larger or smaller way, there is quite a tariff against Canadian staves, and this shuts out our stock to some extent.

Barrel and Keg Consumption Increasing

While the manufacture of cooperage in Canada has decreased during the last ten years, the consumption of barrels and kegs in Canada has increased, and from present indications, with the agitation for sanitary packages, it looks as if the consumption would still further increase. There is no question that, as a handy package, and a sanitary package, the barrel is the best on earth, and while cheaper packages will no doubt always find many advocates where a strong and sanitary package is required there is nothing to equal the barrel.

During the last couple of years quite a number of staves have been imported from the United States, and also some hoops. This is not because there is not enough stock manufactured in Canada to take care of the home trade, but sometimes the demand for export, and for near-by points in the United States is so heavy that it pays the manufacturers to import stock from the Southern States, instead of carrying their own stock for months.

While there used to be a large quantity of tight barrel staves manufactured in Canada, whole vessel loads being shipped from Ontario to Europe, the oak in Ontario has now been pretty well used up and very few tight barrel staves are manufactured here. What we class as tight barrel stock are staves and heading required for barrels, containing liquids, more especially volatile liquids, such as alcohol and malt liquids. Nearly all of the staves and heading required for this business are now imported from the Southern States, and what oak there is left in Canada is used for other purposes, as the quality of the white oak in Canada is very much superior to the Southern oak, both in quality and figure, and is in good demand for furniture, or purposes where great strength is required, or hard-wearing qualities are desired.

As to the future of the cooperage industry in Canada, Northern Ontario has immense tracts of timber still undeveloped, some elm and basswood, but principally birch, maple and poplar, and this timber will keep the market for cooperage stock supplied for years to come.

Hardwoods of Algoma District

A Promising Locality for Production of Toys and Woodenware—Plenty of Power

GENERALLY speaking the merchantable hardwood area of Canada finds its northern and western limits in the district of Algoma, Ont. Algoma is a large district with one of the heaviest mineralized sections to be found in Ontario, and at the same time it is one of the roughest parts of the country. The southern extremity of the district of Algoma is marked by three islands, the largest being the Grand Manitoulin, Cockburn and St. Joseph. These islands are of limestone foundation and are practically an extension of the Bruce peninsula. The timber growth upon these islands has all the characteristics of that found on the Bruce peninsula, and includes all the hardwoods of older Ontario. This is true of the Manitoulin island, especially, where, on the shore of Lake Manitou, an Owen Sound Company operates a mill which has shipped a large quantity of splendid basswood and ash. Thirty years ago square white oak was being shipped to the Quebec market for export to England, from the same district.

Cockburn Island is to the west of Manitoulin and formerly had a good growth of red oak, birch and maple, but unfortunately a large amount of this has been destroyed by fire.

Still further west lies St. Joseph's island, which contains a stand of maple, particularly on the mountain section, a plateau about 400 feet above the level of Lake Huron. This section is now being logged by means of a standard gauge railway owned by the lumber company operating on the island. The largest maple yet cut upon St. Joseph's Island is reported to have contained 1,300 board feet, and the tallest contained four 14-foot logs, the diameter at the end of the top log being 14 inches. The largest birch scaled contained 2,300 feet. This tree was so very similar to cherry that the firm to whom it was shipped some time afterwards sent it to an interior finish factory as birch and had it returned to them because it was said to be cherry. The matter had finally to be referred to an expert.

Quite a fair quantity of basswood is found on these three islands, but only a small percentage of elm. On the mainland there are some fair stretches of ash, commonly known as black ash. On the mainland, across the north channel from the islands, there is an entirely different formation. The old Laurentian igneous rocks prevail and there is an immediate change in the quality of the maple found there, as compared with that of the islands.

In many of the valleys of Algoma, east of the height of land, there are to be found some of the finest birch trees in the world, both for color and texture. Unfortunately the stumpage per acre is very small. In some sections ridges of very fair red oak are found, averaging 24 inches in diameter at the stump.

East and west, a ridge of hardwood runs about forty miles with an average width of ten miles, some parts of it being so clean in the bottom that one can drive through it with a buggy. Unfortunately, this ridge is located so far away from any railroad that it is not as yet accessible

Hardwood lumber has been manufactured in Algoma for thirty years in a more or less desultory manner, no one having accumulated any great wealth at the business, largely on account of the low price, and at one time, on account of unsatisfactory grading by the inspectors employed by Canadian manufacturers. Of late, however, this condition has been altered by the fairly universal use of the N. H. A. rules.

The best way in which to develop the hardwood stumpage of Algoma district would be to construct a plant that would utilize the whole tree, converting the usable timber into lumber and dimension stock, and the poorer end and the tops into chemicals. This is being done successfully in other districts where practically the whole tree, with the exception of the brush, is converted into a marketable product of one sort or another.

The Canadian Department of Trade and Commerce have introduced some of the hardwood manufacturers of Algoma to foreign buyers by means of correspondence, and a Russian order for 10,000 butter tubs per month may be secured in the near future, also an order for 50,000 brush backs of various sizes for Scotland.

The district of Algoma offers, with its wonderful water powers and cheap hardwood stumpage, perhaps the best opportunity for the manufacture of toys and woodenware to be found in Canada. Water powers to develop 2,500 to 5,000 h.p. are available in many localities. There is fair transportation service east or west, by water or rail. There is abundant stumpage specially adapted to the manufacture of toys and woodenware. Those who are acquainted with the district are firmly convinced that there is an opportunity here for working up a large and important industry.

Surveying New Brunswick Timber Lands

Provincial Government Making an Intensive Study of all its Timber and Agricultural Lands—The Method Adopted

By P. Z. Caverhill

New Brunswick is one of the oldest centres of the lumbering industry in Canada. Nearly 300 years ago white pine from the St. John Valley supplied masts for the French navy. When the province came under British rule this trade was still further expanded. Masts, spars, squared timbers, planks, staves and shingles being supplied. In those early days, both the Crown lands and the Customs were administered from London, and only meagre information regarding the extent of the industry is now available. White pine is known to have supplied nearly the whole trade, which in 1825 reached a total of 400,000 tons of squared timber, 6,000 spars, and 25,000,000 feet of planks, boards, lathwood, etc. In that year the trade in white pine had reached its maximum and thereafter rapidly dwindled until at the end of the nineteenth century it had been reduced to a negligable amount, its place being taken in the export trade by spruce.

The first shipment of spruce was made in 1822, when 100,000 superficial feet of deals was sent to England. In 1850, 148,000,000 feet was shipped, including both deals and boards, while at the present time over 400,000,000 feet is shipped annually from our forests.

About the beginning of the twentieth century the public began to fear that the amount of timber cut was in excess of the growth; that spruce would follow along the same lines as pine and the industry, one of the most important in the province, would be short lived on account of the lack of raw material.

In 1906 the Public Domains Act was passed, providing for the better preservation and protection of the public domains. Following this act, in February, 1907, a Forestry Convention was held in Fredericton, to consider forest protection and what the future forest policy should be. The one immediate result of this convention was the creation of a forest school in connection with the University of New Brunswick.

In 1913 an act was passed authorizing the Surveyor General to make a survey of the Crown lands; the object sought being:—

1. To ascertain with as much detail as possible the quantity, quality and character of the timber on the various areas of Crown land.
2. To determine, as near as possible, the annual growth on the various areas.
3. To study logging conditions, estimating the cost of logging and stream driving on the different areas.
4. To locate and map any areas of agricultural land, distinguishing them from other areas suitable only for the reproduction and growth of timber.

This survey has been started this year and it is the intention of the Department to complete it at as early a date as possible. The Crown lands consist of about 7,000,000 acres, of which 6,530,720 acres is held under timber license. The chief aim of the survey is to secure information for the better administration of these lands, both now and in the future, the idea being to put the lumber industry on a permanent basis in so far as the present needs will permit.

The survey will show not only the areas and quantity of merchantable timber, but also what areas are being overcut, and where more cutting could be done, with reasons for the variations, such as inaccessibility, transportation, or speculation.

It will show areas where settlement should be allowed and where the land should be reserved for timber only.

While, as above stated, the survey is intended to gather information for administration purposes, it will nevertheless be of considerable importance to the lumbermen themselves. Not so much in the matter of quantity of timber will this importance be, as most loggers have an idea of the amount of merchantable material on their limits; but with regard to the growth and logging studies.

Many of the mills have long ago finished their virgin stands and are now cutting the second or third crop; that is, they are dependent upon the annual increment to supply their mills. Is this sufficient to supply their needs? Cutting down to a certain diameter, in how many years can a return cut be obtained of equal size? These are questions of vital importance to the industry, which will be answered.

The logging study will show the cost and defect or advantage of the present methods of logging as compared with other methods used under similar conditions; where saving might be effected and waste material utilized; also the possibility of establishing new industries, dependent largely for their raw material upon what is now wasted from stump to manufactured product.

The agricultural classification will show clearly the areas that are liable to be withdrawn for settlement purposes and will thus allow the operator to plan his operation to better advantage.

The plan calls for a four per cent. cruise of the entire Crown land area, and is one of the most intensive surveys yet undertaken on such an extensive area; the work undertaken by the other provincial and Canadian governments being more along the lines of general reconnaisance, except on limited areas cruised for special purposes.

Similar work has been done by the C. P. R. in their holdings in the Crow's Nest; by several of the larger paper companies and by the New Brunswick Railway Company on their lands in New Brunswick.

Hon. Geo. Clarke.

P. Z. Caverhill.

Canadian Western's New Toronto Manager

The Canadian Western Lumber Company announce to their many friends in Eastern Canada, the appointment of Mr. L. D. Barclay as manager of their Toronto sales office at 62-64 King Street East, Toronto.

Mr. Barclay commenced in the lumber business in Ontario, but, like many of the young men of the east, felt that with the opening of the Panama Canal and the gradual cutting out of eastern timber limits, the lure of the west became too strong to resist. Mr. Barclay started with the Canadian Western Lumber Company at their Fraser Mills' plant in 1912, loading lumber into cars and working in the grading sheds. Through persistent and energetic work, coupled with a desire to learn the business thoroughly, Mr. Barclay's promotion was very rapid—from car loader to lumber surveyor, from surveyor to an appointment in the shipping department and thence to the local sales, where Mr. Barclay had charge of the Canadian Western Lumber Company's retail sales in the city of New Westminster and suburbs. Mr. Barclay later covered the province of Saskatchewan and from there was moved back to Toronto as assistant manager of the Toronto office. Upon the resignation of Mr. Hugh A. Rose, Mr. Barclay has been appointed manager of the office. His thorough experience of Pacific Coast lumber, coupled with a knowledge of eastern Canadian conditions, and an acquaintance with so many of the eastern Canadian trade, made Mr. Barclay the logical man for the position.

The appointment is in line with the policy of the Canadian Western Lumber Company, in that it believes in educating its representatives, who are to meet the trade, first of all in the manufacturing and grading of its products, and when they demonstrate their ability in this line, they are sent out to represent the company in different markets where British Columbia woods are being used.

Hon. G. Howard Ferguson, Minister of Lands, Forests and Mines for the Province of Ontario, has decided to open the Gillies timber limits on the Montreal River once more, for prospecting and staking, and also for sale or lease for mining operations.

Canadian White Pine Should Be Advertised

Wood Substitutes and Imported Lumber Reaping Benefits of Publicity While White Pine Stays in Hiding

ONE of the most remarkable and probably one of the most important developments in connection with the lumber industry in the United States during the past few years has been the growth of the co-operative movement for the advertising of important lines of lumber. One might name a long list of special lines of lumber in the United States which are now being successfully advertised by those who are chiefly interested in their production or marketing. We may indicate the nature of this list simply by mentioning a few of the varieties of lumber, such as Arkansas soft pine, cypress, redwood, northern hemlock, white pine, etc.

This development is a logical result of the fact that practically all other lines of natural products manufactured in the United States have been extensive users of advertising space for many years past, and those which compete with lumber have been cutting seriously into the markets that were formerly supposed to be the natural and sole possession of the lumber manufacturers.

Now that the advertising of lumber has been clearly demonstrated as a feasible and profitable scheme in the United States, and as it has been so definitely worked out along the line of advertising special varieties of lumber, the manufacturers of which pool their interests and share the expense, the question naturally comes up why something of the same sort should not be done in Canada. There are certain varieties of lumber in Canada which seem to require something of this nature in order to put new life into their markets. Everyone who knows anything about lumber history in Canada will, when reading this, think first of the case of Canadian white pine, the old king of Canadian lumber, which, on account of the heavy drain made upon the white pine forests and on account of the co-operation of many other curious and adverse factors, has been deprived of its old place in the sun, has come upon evil days, and is sadly in need of something that will put it back into the honorable place in public esteem which it so richly merits.

The Finest Soft Wood in the World

Let us assume, what practically every lumberman knows, that white pine is the finest softwood that has ever been produced, and that the public if they had not been wooed away from it by the arguments of those who are interested in other lines of wood, and other substitute products, would now be consuming far greater quantities of their old favorite than they are. Then let us call to mind the success of the substitutes, both wood and otherwise, and we question if anyone, whether he be interested in white pine or not, will contradict the statement that white pine ought to be advertised. One of the largest manufacturers of white pine in Ontario, a firm which has had long experience both in the manufacture of lumber and in the production of finished articles of various kinds made out of lumber, writing to us recently says that one of the biggest arguments in favor of the inauguration of an advertising campaign for white pine is that practically every other kind of wood is being extensively advertised and people are becoming so used to using articles that are advertised that the demand for white pine is suffering correspondingly. It is almost ridiculous, this writer says, to note how much faith the public puts in anything that is advertised; in fact there seems to be almost no limit to the amount they will believe, so long as they see it in an advertisement. This is not suggested as a reason for advertising white pine, which fortunately has ample merits for a good advertising campaign, but it is mentioned merely by way of illustrating how the advertising of other materials which have not the natural advantages of white pine, has eaten into the market. The insidious effect of advertising is, in fact, something which ought to be very definitely borne in mind, because it can be made to produce splendid results in the case of white pine, both for the manufacturer and the consumer. Every lumberman knows how frequently he comes across someone who knows little or nothing about lumber, but who, after reading advertisements, or talking with someone who has been reading them, will come out with an assertion that a certain class of lumber is superior to any other, for certain kinds of work, not really knowing anything whatever about the matter. He simply has been educated into such a belief by the force of advertising.

The greatest home of advertising in the world is the United States, and we are not surprised, therefore, to find that the woods of the Southern States have been among the first to benefit from advertising; nor are we surprised to see that this advertising campaign has produced effects not only in the United States, but in Canada, and has been an important factor in the marketing in Canada (one of the greatest lumber producing countries in the world) of vast quantities of lumber of various kinds from the Southern States. In fact, it is astonishing how great an amount of such lumber has been imported into Canada, as shown by the statistics published by the Government. A great many factors have combined to produce this result, but none of them is so potent as the insistent and widespread publicity purchased in newspapers and periodicals, both in the United States and Canada, by the producers of United States woods. This campaign has taught everybody to renew his old appreciation of wood as a building material and to give the preference to those few definite lines that have been advertised. The education has reached all classes, both in the United States and in Canada. As a result, we find architects in Canada specifying the use of southern woods, chiefly because they have been educated to a belief in their special suitability for construction purposes and finish. Canadian architects have acquired this unfortunate habit to a regrettable extent and have been specifying southern woods in great quantities. Architects are, indeed, responsible to a considerable extent for the importation of American woods into Canada. But are they really to be blamed for following along the line of least resistance?

If the manufacturers of Canadian woods, white pine for instance, are not sufficiently interested in their product to make a fight for the market, how can the architect be expected to take any interest in Canadian woods? It might be thought that a Canadian architect would be patriotic enough to favor Canadian woods wherever possible, and probably in most cases he would do so; but that is just where the advertising campaign on the part of the producers of American woods has got in its fine work. In the absence of any persuasion regarding Canadian woods, and in the presence of such definite advertising by American producers, many Canadian architects have come, almost conscientiously, to the conclusion that the interests of their clients are best served in many cases by the use of southern woods.

Probably this situation applies more definitely to the case of white pine in Ontario than to any other case which we could mention. Most of the white pine manufacturers and dealers, as we see it, and as we believe many of them will also admit, have allowed themselves and their business methods to get into a rut, out of which they do not seem to have any wish to pull themselves. All that they realize is that their product is selling fairly well at times, and at other times it is not. The situation is a difficult one to understand. It has always been more or less of a puzzle to the lumber trade, but nevertheless it exists, and the object of this article is to lay before the white pine men of Canada a simple proposition, that they should make a study of their own case, and in doing so, consider whether they ought not now, before it is too late, to get into the procession and educate the public to a proper appreciation of the splendid product turned out by the white pine mills. There is nothing personal about this idea. We have simply seen the course of events across the line and we have come to the conclusion that the depression which so regularly develops in connection with white pine might be relieved, and to a great extent obliterated, by co-operative advertising. It would only be necessary for the white pine people to make a comparison of the increase in the prices of other lumber stocks, which are not comparable for one minute with white pine, in order to convince them that their own product could be disposed of far more profitably if the public were shown by modern advertising methods what an excellent material it is.

The preparation of copy for white pine advertising would not be a difficult matter. There are so many striking arguments in favor of its use that splendid advertising copy could be prepared without difficulty by a good copy writer. It would be a simple matter, by referring to the longevity, splendid working qualities, great variety of uses, etc., of white pine, to educate the reading public quickly to a far better appreciation of its many virtues. Any group of white pine manufacturers or dealers could readily draw up a practical list of advertising points in connection with such a campaign.

This matter has been under discussion quietly among a few prominent white pine manufacturers and dealers in Ontario. We hope that as a result of this discussion, and of the case we have made out in favor of an advertising campaign, something definite will be done in the near future. Why should not a representative gathering of white pine manufacturers be held to take up this subject?

Edward Harper Wade.

The European War and After

Position of the Lumber Trade Before, During and Subsequent to the Great Conflict

By Edward Harper Wade

At the present time all interest, not only for individuals, but for business, centres in the conflict now raging. Speculation tries to fathom its probable duration or forecast the conditions that will follow its conclusion. For Canadians, as for the allies, there is only one possible end, the final and decisive defeat of the German confederacy, and the utter destruction of the Prussian military power, followed by readjustment of frontiers in accordance with the desires of the people most interested, and perfect, lasting peace. This may be far off or comparatively near at hand, but in the light of past history is inevitable. It was conceded by historians that the erruptions of barbarians that menaced civilization in the past had under modern conditions become impossible, yet Prussian-controlled German hordes have swept over some of the fairest parts of Europe, wasting fields and destroying cities, ruining cathedrals and burning libraries, levying exactions, shooting non-combatants, violating women and mutilating little children, in short perpetrating all the horrors that marked the incursions of the Huns, of the Goths and Vandals, or of the Turks and Moors, but they have antagonized and aroused the civilization of the world and their doom is inevitable. Already, it is reported, Longwood, Napoleon's residence at St. Helena, is being put in readiness for another guest.

Lumber Business Greatly Affected

Possibly no business has been more directly affected in various ways than the timber trade, and for no other has after war conditions a closer or deeper interest. The money that has poured into the United States will to a certain extent go out again for Canadian lumber. The people of the United Kingdom have learned more respecting the intrinsic value of wood since the war commenced than in all their previous history. They have for some time past grumbled over the increased price of wood generally—an advance that arose from the depletion of the forests, the greater consumption in the supplying countries and the heavier cost of manufacture and delivery at the port of export, but this has specially been in the higher grades, and has been met in them by limiting consumption and substituting cheaper woods or other material whenever possible. Now the advance has come in wood of all descriptions, including the lowest grades and the cheapest kinds. To give one typical instance out of many. Churchill & Sim, leading London brokers, in their circular of August 6th, 1914, gave the current selling value of New Brunswick spruce deals as £10 10s. to £11 per Pg. Std. of 1,980 feet B.M., with oddments, battens and fourths at £9 to £10, equal to an average all round price of about $24.25 per 1,000 feet B.M. piled in London. The same firm in their circular of February 29th, 1916, gives the value of the same descriptions at £28 to £29 and £26 to £28, equivalent to $64.25, an advance of about 165 per cent. Now where are the substitutes of which we heard so much at every slight advance in times past? It seems a particularly favorable time for their appearance, but practically they are conspicuous by their absence, and consumers pay for their requirements the increased prices as readily as they did the former ones, seeing no alternative. The intrinsic or real value of wood is clearly demonstrated against its commercial one under competition.

No doubt a great proportion of the advance comes from increased ocean freights. Great Britain has always recognized the value of her fleet, and whatever party has been in power the Government has maintained the naval efficiency as a necessary protection to the shores and commerce of the United Kingdom, but the value of the mercantile marine was only dimly recognized. Yet under the enterprise and management of the steamship agents and owners, the mercantile fleet steadily increased without Government protection, subsidy or assistance, till both ocean freights and marine insurance reached lower and consequently cheaper levels than ever before. On the whole, no doubt a fair return for the investment of capital was obtained, but in many cases the margin of profit was extremely small for the service rendered. That 165 cubic feet of deals should have been loaded, taken across the Atlantic, and discharged for delivery for 40s. per P.S.H., as was sometimes the case. is one of the wonders of modern commercial traffic, seeing the rate is equal to less than $5 per 1,000 feet B.M. After the war commenced freights began to advance, at first slowly, but later by leaps and bounds, till 45s., the current rate when hostilities commenced, has become 350s., with more enquirers for tonnage than steamers available.

It is quite certain there will be an immense demand for wood on peace being restored. Man requires first of all food, then clothing and next shelter, and except in a tropical clime the need for the latter is almost as imperative as for the former, though not so immediately pressing. Of all possible material a shelter can be most readily constructed with wood. Scantlings and boards are readily transported, quickly put together and form an efficient shelter.

The Crimean war in 1854 created the last high-water mark of wood prices in the United Kingdom, and at the close of that war they fell heavily and rapidly, but conditions were entirely different in many respects from the present, and no comparison can be drawn.

It seems certain that, after the war, new commercial conditions will obtain. For the United Kingdom the income tax and death duties, the spirit and beer excise and customs, the tobacco and tea duties, the post office and other present sources of revenue, will probably be insufficient in their product to meet interest on the National Debt of the future, pay war and old age pensions, and defray general necessary expenditure, so it is highly probable an extended customs tariff will be necessitated. This will give an opening for Colonial preference that hitherto has been wanting, and is quite likely to benefit the Canadian wood trade. Each of the Overseas Dominions might arrange its own tariff on its own lines as heretofore, but by common agreement each portion of the Empire might concede a reduction of one-third of the duty to any other part, with some possible necessary exemptions, to apply to all, such as spirits and tobacco. It is regrettable that the one-third concession, or British preference, which was at one time the special feature of the Canadian customs tariff was ever abandoned for the present system of three separate rates in the same tariff. Formerly each Canadian province made its own tariff and held its own customs boundary. At Confederation this was swept away and free trade within the Dominion arranged, with a common customs boundary. The same process followed in Australia and South Africa, and in the long run no one was the worse and all benefitted. Is not the next logical step free trade between the four Dominions and any other British possession that desires to come into the arrangement, or failing free trade, as large a percentage preference on the tariff of each Dominion as may be found possible or advisable. Does anyone suppose the result would be disastrous for Canada, if she admitted duty free everything except spirits and tobacco that Australia, South Africa and New Zealand could send her in return for a similar concession on the part of these Dominions, and how great a benefit would the corresponding concession be to the lumber trade of the Pacific Coast and Canada generally, in connection with Australasian and South African business. The United Kingdom might still be limited to a tariff percentage reduction as at present, till she had defined her new tariff and decided on her future customs policy.

The Rate of Exchange

The question of the rate of exchange, at one time during the war, a source of very considerable anxiety to Canadian and American shippers to the United Kingdom, now seems well in hand. The sovereign, or pound sterling, payable in London, for a time lost a portion of its purchasing power in the markets of this continent. Early in September last year, while Canadian banks would readily give in exchange for fifteen sovereigns the sum of seventy-three dollars, they would only give about sixty-eight dollars for a sight draft on London for fifteen pounds sterling, a heavy loss to shippers of wood and all produce. The situation was finally relieved and exchange brought back to approximately its normal condition by the British Government purchasing and mobilizing American securities held in England, and transferring some for realization to the markets of the United States, so re-establishing the balance of trade which had been upset by heavy shipments of munitions and produce from this side against greatly reduced imports from the United Kingdom. It is remarkable that the remedy was first suggested by a correspondent of the Montreal Gazette on August 23rd last, though not adopted in London till all other attempts to adjust matters otherwise had been found inadequate.

The wood export trade of Canada need have no fear of a return of such adverse exchange conditions as prevailed for a time last year.

In the present scarcity of ocean tonnage it seems regrettable that interned German steamers should be idle in United States ports. If they could be sold by auction to the highest bidder, the proceeds of the sale to be held instead of the steamers by the Government of the United States till the declaration of peace, both the owners of the vessels and the commerce of the world would benefit, and it is possibly not beyond the wit of man to devise restrictions that would prevent the purchasers from using them to the detriment of the Allies, so no one would suffer.

It seems certain that at the termination of histilities there will be an unprecedented demand in Europe for wood, and the steamers now employed in transporting troops or military supplies will again be available for its shipment. It would be well for all members of the trade to keep this in mind.

New Conditions Created by European War

High Cost of Tonnage—Scarcity of Vessels—Wooden Ship Revived—Skilled Labor Enlisting

By Elihu Woodworth

THE war has created a number of new conditions which have had and are still having a direct bearing upon the lumber trades. Some of these conditions were brought into existence almost as soon as war was declared and have affected the trade ever since; others have been created or developed at a comparatively recent date, but are none the less making their influence felt. Separately or combined these conditions have produced results such as were never before known in the history of the lumber trade, and such as are by no means likely to be experienced again.

Early in the war came what practically amounted to the closing of the ports of Northern Europe. Some of these, it is true, were still nominally open, but the attendant risks largely discounted their commercial value. When the cost of importing European lumber became in a measure prohibitory, British buyers were forced to look elsewhere for their supplies and, very naturally, the demand for Canadian lumber became very urgent. The increased demand and the consequent advance in prices would have undoubtedly been very satisfactory to Canadian lumbermen, but unfortunately they were confronted by an unexpected condition which threatened to neutralize their advantages. This was an almost unbelievable lack of tonnage, and this remarkable shortage, like the imperative demand for more bottoms, was due to the war. In recent years steamers, as deal-carriers, as well as in other trades, had practically driven sailing ships off the seas, but there appeared to be no reason to anticipate a scarcity of steamers. Here, once more, the war became directly responsible for an unexpected and far-reaching condition. The British Government found it necessary to commandeer a large fleet of merchant steamers for the transportation of war materials, and many others were destroyed by mines and submarines. The result was that the supply of available steamers was found to be entirely inadequate to meet the requirements of the trans-atlantic trade. In this emergency old sailing ships, which for years past had found little or nothing to do, were refitted and remanned and again put in commission on better terms than they ever had before. A fleet of small three-masted schooners, which had hitherto been employed in the coasting trade and which were believed by many to be utterly unfit for ocean navigation, now came to the aid of the "square-riggers" with satisfactory results, and, with the assistance of the few steamers that could be secured, managed in the aggregate to handle exceptionally large shipments.

Meanwhile, growing out of the other conditions, a very important condition was developing, one which although not unknown at other times, soon surpassed all former records. The freight on deals to the United Kingdom, which had risen to fifty shillings per standard at the close of 1914, jumped to ninety shillings in February of last year. The rate advanced steadily during the season, and the year ended with offers of two hundred shillings. In January a charter was closed at two hundred and twenty shillings, and it was thought that the limit had been reached, but a month or so later no ship-owner could be found who would consider anything less than three hundred. A few weeks ago a charter was closed at three hundred and twenty-five shillings, and it is currently reported that the astounding rate of three hundred and fifty shillings is being offered. This report may be slightly premature, but there is little doubt that this figure or even a higher one will soon be reached, and there are men interested in lumber and shipping who are confident that the marvellous advance in rates will not stop short of the four hundred mark. Nothing even remotely approaching present figures was ever known before. Old ship-masters tell of a brief period during the Franco-Prussian war when the rate rose to one hundred and twenty shillings, but this extraordinary advance was shared by very few ships. Since that time the rate has been down to thirty shillings or lower more frequently than it has been up to or above sixty.

One might reasonably suppose that the present freight rates on lumber would prove prohibitive, and they undoubtedly would have that effect if the lumber were required only for ordinary purposes. But the conditions in this great war are new and strange and, as a consequence, the materials of war include large quantities of lumber. Freight charges approximating forty dollars per thousand feet, added to the original cost and extremely high rate of insurance, would soon stifle any ordinary demand for lumber, but when it is required for war purposes the cost becomes a secondary consideration. The quantity of lumber imperatively needed in the prosecution of the war is almost beyond belief. Millions of shells are being turned out as fast as men and machines can make them, and many million feet of lumber are required to make boxes for their transportation. Battle ships of all kinds are being built rapidly and much lumber is used in their construction for staging and other purposes. Lumber is the only material available in many places for making huts for the soldiers, and, when it can be procured, much of it is used in the trenches. While the war lasts lumber will be required for war purposes.

Another condition arising from the abnormal freight charges and intimately connected with them is the excessive advance in the price of merchant ships. Old vessels which would have been sold for a song a few years ago, have been bought recently at prices covering or even exceeding the original cost of construction. One Parrsboro schooner built six years ago at a cost of about $16,000, was sold the other day, it is said, for $25,000. A barque that was dismasted at New York last year and was converted into a barge, was sold recently for $42,000, and is being rigged as a schooner. American schooners well advanced in years, which found little to do before the war, are now busily employed carrying lumber from Nova Scotia to United States ports. Every vessel at present available has been chartered to carry deals, and yet it is feared that the scarcity of tonnage will be much greater than it was last season. Many Nova Scotia shipyards are once more active after a period of idleness, and will turn off quite a fleet of sailing craft during the year, but most of these vessels, although built for and well adapted to the business, will be launched too late to render much aid in relieving this season's shortage.

Enlistments Affecting the Labor Market

Another condition which has just arisen and was undoubtedly created by the war, and which is likely to exert a marked and far-reaching effect upon the lumber industry, is the extremely large number of enlistments among the lumbermen. It is customary in the lumber camps after the logs have been cut and yarded, and while the snow is still deep in the woods, for the men to come out to their homes or to the nearest town and wait for the snow to melt and the streams to rise. When a permanent thaw comes and the ice in the streams break up, the men, or as many of them as are required, go back to the woods and "drive" the logs to the mills. When this task is completed large numbers of the men are drafted into the mills and are kept busy during the season preparing the lumber for shipment. Others find employment as stevedores or wharf men, and, as a rule, all the men who work in the woods in the winter have something to do with lumber during the remainder of the year. All this has now been changed. When the lumber-jacks came out of the woods this spring they were met all over the country by recruiting officers who offered strong inducements to enlist, and were very persuasive and persistent in their solicitations. The result is that very large numbers of the sturdy choppers and teamsters have joined the colors, while a few who are not enamored of trench fighting have enlisted in the Forestry Brigade. No better material for making soldiers than the men of our lumber camps can be found anywhere and everyone is proud of the noble way in which they are coming forward, but the fact remains that the almost universal enlistment of our lumbermen is bound to have a marked effect upon the immediate future of the lumber trade. Sailors, too, have enlisted in large numbers, and

have thus increased the difficulty of securing tonnage; but neither the lumber-jacks nor the Jack Tars have a monopoly of the khaki, for men of all classes have responded to the call of their King and Country.

The conditions created or developed by the war have in their turn produced problems that are extremely hard to solve. The solution of some of these depends upon and will quickly follow the termination of the war; while others will require considerable time for readjustment after peace returns. According to present indications there is good reason to fear that a considerable portion of last winter's cut of deals will have to be carried over. Such a result seems inevitable unless the Government releases sufficient steamers to supply the required tonnage. Even if this course should be pursued it will not afford full relief unless it is done quickly, for lumber shipments, especially when men are scarce, cannot be pushed beyond clearly defined limits. If the war continues, the Government can scarcely be expected to spare the required number of steamers, as it seems safe to assume that there is no reason to hope for large lumber shipments this season.

What of next winter's output? Well, the answer to this question seems to depend almost entirely upon the duration of the war. Unless the great conflict ends within a few months the lumber cut of next summer will be the smallest in many years, for the simple but sufficient reason that men cannot be had to do the work. High prices will be of little benefit to the operator who is unable to prepare his lumber for market, and only a very small portion of the work required for an average cut can be done by the men now in sight. This seems unfortunate, but it will not be an unmixed evil; for the most of the trees left standing will be greatly benefitted by having more time to grow.

Perhaps the toughest problem of all is the one that confronts the shipbuilders. For some years before the war wooden shipbuilding had ceased to be regarded as a profitable enterprise. Nearly all the shipyards were closed, and the only vessels turned off were additions to the fishing fleet, or an occasional coaster to replace one that had been lost or in some other way put out of commission. The war changed all that. It would pay to build ships—even at war prices for part of the materials—when two or three successful voyages would clear the cost of construction. A fleet of fine vessels will be turned off this season and will probably prove a good investment. The builders will be in a better position to continue the work than they were to begin it, and the shipyards will keep busy if the war should continue through another winter. But will it pay to build after the war is over? If it should end soon there would still be strong demand for tonnage, but the present abnormal rates and prices would cease to exist, and there would be a rapid decline in the value of wooden vessels. To sum up, the war dominates the lumber industry and everything connected with it. It has been the cause of fabulous prices and freights, it has created a remarkable scarcity of tonnage; it has revived the wooden shipbuilding industry, and it threatens to restrict the lumber output.

Americans Must Pay More for Our Wood

A Discussion of the Pulpwood Situation as Seen by a Canadian Railroad Land and Timber Manager

By Cyril T. Young*

If a knowledge of the pulp resources of Northern Ontario and Northern Quebec from Lake St. John through to the Manitoba boundary and from the Ottawa River and the Great Lakes north to James Bay, gained from 22 years of northern experience both personally and from reports of assistant cruisers, warrants me in breaking into print for the first time on this subject, it will also comply with your journal's invitations to contribute, which I cannot courteously turn down any longer, in view of the services you have rendered me personally, as well as the people that I represent.

Knowledge of timber resources alone, does not, however, give me the full grasp of the whole situation that I get from daily association with our freight departments. It will be admitted that when a man can point to any section of Northern Ontario and Northern Quebec on the map and say definitely how many cords per acre of pulp wood and tell you the freight rate from the different sections to the mills on the Hudson; to Lake Champlain; to the Watertown district; to Niagara; to Johnsonburg; to Erie; to Port Huron; to Green Bay and other mills on Lake Michigan, together with the paper rate from the Canadian paper mills into New York and Chicago, that he should know **something** of the industry and its future. Just how far a man who has this experience is going to break into print may, however, be another question, for in every walk of life, the successful men are those who know how to obtain dividend cheques from their stock of knowledge.

Will Our Spruce Follow Our White Pine?

The same awakening is coming to us later, on our pulpwood area as we received on our high class white pine area a few years ago; and American mills are now going far afield for their wood, one rail haul delivery this winter being 846 miles, and quite frequently 700 miles. This is due not only to the constant erection of more mills, but to the increase in the capacity of mills already erected on the American side. To date, it has been the short log haul and easily-driven timber and the 13 to 16 cent rate wood that has been reaching these American mills. Supplementing this rail haul timber, is the St. Lawrence and Anticosti wood, which, before the war, was reaching points as far west as Erie on a $2 per cord boat rate prior to the present scarcity of bottoms, and also, though a much lesser quantity, of Nipigon, Port Arthur, Knife River wood reaching Erie ports at the same figure, or towed to Ashland on Superior and getting into Green Bay section by rail haul from Ashland South.

The European conflict has not only affected shipping of pulp from Norway, Sweden, and Russia, but the removal of bottoms from the Great Lakes for either trans-Atlantic or coastwise trade, has resulted in making Great Lakes delivery of pulpwood practically impossible in cost, except to the mills which own their own vessels and their loading, and in some cases discharging, equipment. This is resulting in increased demands—very strong at the present time, for rail haul wood from settlers' lands and patented lands in Northern Ontario and Northern Quebec, which can be exported to the American mills, and when bottoms can be secured, this applies to New Brunswick wood as well.

Export wood, like lumber, must inevitably go higher, due to the scarcity of labor in Canada from enlistment, and the demand from war industries which men find more congenial to home life that the woods employment affords. Added to this is the increased cost of provisions, such as hogs, live weight at $12 per hundred, and sugar at $10 per hundred, wholesale, with no possible outlook other than further advances in the provision market all round. Added to this is the increased and ever increasing cost of barking plants, saws, boilers, chain, rubber, leather belting, etc.; several of which have gone up from 65 per cent. to over 100 per cent.

Are Railway Rates Too High?

American paper mill men think that railway rates on pulpwood are too high, yet the earning power of rolling stock and heavy engines is lower today on pulpwood and especially on paper in Ontario and Quebec than on wheat from western points to the head of the lakes, principally on account of the fact that return freight to the prairies is made possible by up-bound cargoes from the lake steamers and the package freight lines. The present pulpwood rates do not warrant the purchase of additional box cars at the prevailing cost in these war times, and flat cars equipped as rack cars for summer shipments will assist in the solution.

Niagara and Watertown mills purchasing wood in Temiskaming, fail to see why the Ontario Government Railway (T. & N. O.) and Grand Trunk cannot get their rates down lower on pulpwood. Are they aware that, notwithstanding the immense traffic and tonnage derived from Cobalt and Porcupine mining camps, this government-owned railway, in past years, has only been able to earn one-third of its interest charges, due to low rates, and particularly low rates on pulpwood and timber products, resulting in the people of the province of Ontario, through its Government paying two-thirds of its interest charges and total assumption of the amortization of its bonds. Berlin and New Hampshire mills clamor for rate reduction from Roberval on Lake St. John and from La Tuque and Three Rivers, south without a thought to increased cost of operations at present, for while the return from production in every industry has risen with leaps and bounds, the railway rates are still without an advance except the 5 per cent. conceded by the Interstate Commerce Commission.

The final solution does not lie in cheaper Canadian wood or de-

* The author of this article bases his conclusions upon his experience in charge of Ontario and Quebec land and timber for the Canadian Northern Railway System. We invite the views of others upon this important subject.

creased cost of transportation but in **increased paper prices** during the period of the war. Canadian pulpwood operators selling to American mills are not now making any more money than heretofore and are taking immensely larger risks unwarranted by the profits obtainable. Personal friends of mine are operating all the way from the head of the lakes through to St. John and have made less money and some of them more debt within the past eighteen months than at any other period of their pulpwood operation. Many of the operators have had to close out entirely, and this is bad, for the reason that in any business, if the stream of consumable goods is steady, economic life goes on smoothly; while, if for any reason the stream is interrupted, more or less serious consequences always ensue. Operators should go further in insisting on financial assistance from the buyers, for these mill owners know that there is no greater help to legitimate business than well regulated and easy flowing credit.

Nor is the quantity for future supply to these American mills up to a 19c rate, by any means unlimited. Most convincing indeed is a map showing the pulp concessions granted in Ontario and Quebec, and if to these could be added those that will likely yet be granted on five good pulp and paper mill sites remaining in the north, the result would be more convincing still. Mill sites to manufacture the wood growing north of the National Transcontinental are impossible except at Lac Suel and none on the Nelson on the Hudson Bay line. I might also possibly add one on the upper waters of the St. Maurice above La Tuque. All the other waters are flowing north and will not be intercepted by steel within a quarter of a century.

Looking away to the future, because some of our Canadian mills will yet have to go as far afield for their wood as the American mills who are rail hauling 600 miles are doing today, it would be well to state frankly that there is no commercial timber for a hundred miles south of the waters of James Bay on the territory known as the James Bay Basin.

Are Our Spruce Resources Over-estimated?

Many Canadian and American mill men have the idea that because they are told spruce is growing on the banks of the Albany, lower Mattagami, Moose, Hurricanaw and Nottaway, Northern Ontario and Northern Quebec is all timber country. If they were to get out of a canoe and travel inland for days as I have done, not only below the last portages going down to James Bay, but away up on the rivers, sometimes even south of the National Transcontinental, they would find merchantable timber does not exist back from the river banks. This is true of an immense area around Lake Mistassini, north and west of Lake St. John, where heavy fires have occurred, on across the Hurricanaw and Moose—on past Martin's Falls (the only fall in 300 miles of navigation on the Albany) and I understand from Indians on through Patricia to Port Nelson, for all this lowest bench of land is practically muskeg.

It is all very well for reporters to turn up Departmental records of northern exploration of 1910 showing 288,000,000 cords of spruce in the then explored section of Northern Ontario, but is it there, out on the ground? It certainly is on the better sections of the northern clay belt such as Temiskaming, Abitibi, and parts of Mattagami, Kapuskasing, and Missinabi, but I personally know large sections grossly over-estimated at forty-five to eighty cords to the acre, that cannot possibly cut more than four to five cords to the acre, on the average. Spruce mixed with pine is sometimes quite deceiving, and certain pulp areas further south, estimated at ten cords to the acre average, are today actually cutting out less than two cords to the acre.

Returning to the immediate question and summarizing:—Woods labor will be seriously acute by November 1st—wholesalers refuse even to guess where provision prices will reach—and equipment is proceeding skyward steadily.

Before the termination of the war you will see "News" selling closer to $40 New York delivery than the $25 now quoted, for, even at present, many of the mills have no reserve supply of wood and everywhere the stock of "news" is getting very low, notwithstanding the fact that we are not yet in the low water period affecting the grinders and output. Our cheaper jack pine and poplar woods should be more utilized in crafts and wrapping paper and then the logging of all timber together would cheapen spruce wood costs.

With South America, Asia and the entire Continents of Europe in urgent need of pulp and the public (with extra money in their pockets) buying more war extras than they really require, why should they not pay the cost of increased raw material—pulpwood?

Forestry Battalion in England

A cable from London, England, under date of May 9th announced that the first section of the Canadian Forestry Battalion was already doing useful work in Great Britain, having commenced hewing and preparing timber for military purposes. The battalion is moving about to sections where good quantities of timber are available. It has already had a turn at the Royal Estates at Windsor and the men have expressed great surprise at the abundance and high quality of British timber.

Increasing the Markets for Birch

A Hardwood that Has Recently Advanced from Neglect to Well-Merited Appreciation

By J. M. Donovan

In a sense, the present age, from a commercial point of view, may quite fittingly be considered as the age of substitution. What with the innumerable discoveries of chemistry which are being put to commercial uses and economizing the world's supply of raw materials, frequently even improving the raw state of natural products so that they can be put to new uses, and the universal endeavor on the part of capital, and on the part of economists, to find substitutes for almost everything, all of which is primarily due to two facts, the present restriction of supply and the high cost of production, truly we may call this the Age of the Substitute.

Even in our own line of business—lumber—the substitute is making a bold bid for a firm foothold. As an actual matter of fact, the lumber business has been hit harder possibly than any other by the substitution evil. Metal shingles, metal ceiling, windows and partitions, and concrete floors, give eloquent testimony of the statement. Even within its own circles the lumber business is affording a fertile field for the operation of the substitute germ. New woods are being tried out all the time, the end in view being to use them as substitutes for woods that are now in use and of which there is likely to be a great shortage as they are being removed from the bush so rapidly, and in many cases felled wastefully and even allowed to rot where they fall, or to be destroyed by fire. Possibly the day will come when specimens of the present commercial woods will, like the dinosaur, diplodocus or the mammoth, be placed on exhibition in museums and classified in the catalogues as:—"now extinct, flourished about the year A. D. 1916."

It is only necessary to mention one wood as a type to bring this idea home definitely to the lumbermen, namely, white pine. For many years now, we have been endeavoring to find a suitable substitute and have failed signally. One wood, however, furnishes an interesting side light upon this situation and stands out prominently in the Canadian lumber business in an interesting manner. Probably, for variety of uses, Canadian birch is second only to Canadian white pine.

No Longer a Lowly Lumber

The time was, when birch was considered so lowly a thing as lumber that a salesman was scorned when he offered it to a customer. Today, the situation shows a vast change. Offer some of the buyers a few choice sizes of birch today and you do not need to stand on the thresholds of their offices in fear and trembling, for the birch salesman is received with all the deference that is paid to an emissary of royalty, and well might he be thus received for the wise buyer knows that good birch is scarce. There is plenty of scrub birch to be had. Trees that are not fit to be cut and sawed into lumber, yet which find their way into the lumber piles because of the great rush for the almighty dollar. It might pay the manufacturer better to turn these same logs into staves, hubs and spokes instead of lumber, and a few wise manufacturers are doing this and realizing a much higher average price for the cream of their logs.

Good birch is scarce. Lumbermen ought to get this fact impressed firmly upon their minds, for they will see, not in the distant future, the greatest shortage of birch in history. In Ontario there are only about two firms who have, or will have, for sale as much as five million feet of birch during the present year and only one of them will have over ten million feet. When it is realized that there are hundreds of wholesalers and manufacturers who ordinarily handle five to ten million feet a year, and who this year will not have over 200,000 feet to sell, the cause of the probable shortage will be understood. Therefore, although some lumbermen may feel a suspicion that this is a bit of exaggeration, they will do well to take heed, for they will have to pay the highest prices they ever paid for birch as the year advances, and those who do not cover their season's requirements of choice cuts early will find them gone a little later on, and will have to be content with some of the scrubby stock.

Its Wide Variety of Uses

It is surprising to find to what a variety of uses birch is being put. It is being used as a substitute for walnut and mahogany every day. A few of the new uses for which it has been found adaptable are, gun stocks, saddle trees, billiard tables, agricultural implements, automobiles, patterns, cream separators, staves, hubs, spokes, wagons, etc.

Box manufacturers are at last learning the merits of birch as a box material, and it is safe to say that, in the future, considerable quantities of birch will be cut up for this purpose. Heretofore, white pine, spruce and basswood have had the call, but the advent of shell boxes upon the scene has shown the box manufacturers some of the

latent possibilities of birch. The favorable points of birch for boxes are: strength, durability, facility of nailing, the small likelihood of splitting, and last, but not least, the low cost, which is a great feature in the opinion of the box maker.

The production of one high class musical instrument, the piano, consumes an enormous quantity of birch. It has been found that this wood possesses many desirable features that make it especially useful in connection with the production of pianos and organs. Manufacturers of these instruments are using it extensively.

Birch has even invaded the sanctum of the wagon manufacturer. Several American wagon manufacturers who specialize on farm wagons find that birch works to advantage, and many of their wagons are finding their way into Canada, where they are giving entire satisfaction. This is in the face even of the original duty and an additional war tax. Canadian wagon manufacturers should make a stir and meet this competition. Birch is right here at their own doors and they do not have the additional expense of duty and war tax. Quite a considerable quantity of this wood is also used for sleigh benches.

The largest manufacturers of billiard tables in the world are slowly but surely cutting down the quantities of mahogany and walnut used in their product, and substituting birch, with the view eventually of using nothing else. They are finding that the wood works to advantage in their line and that the cost is considerably less.

A new field for birch is being opened up in the production of spokes. Of course, this is a new business at present and is being tried out as an experiment.

The writer has seen some very fine specimens of staves manufactured from the lower end of the birch log and there seems to be a good field for birch in this line of work.

One could write indefinitely about the uses to which birch is being put and the experiments that are being made with it. The time is coming soon when birch will be classified as the most desirable of all commercial woods, and where yesterday and today it was considered only in the light of a substitute for the more valuable species of woods, tomorrow it will be found among the species known as "precious" and we will be looking around to locate a substitute for it.

Do Tight Belts Give Best Transmission ?

An Old Theory Giving Way to Modern Knowledge About Slack Belts, Idlers and Pulleys—The Slack Belt's Advantages

By N. G. Near

It is gradually being learned that tight belts are not essential to positive and efficient belt transmission. The most important points to be observed in the care of belts is: keep them from getting hard, dry, and stiff. A pliable belt will lie down close on the pulley and every available square inch of pulling surface will be brought into active contact. The coefficient of friction of the belt is thus brought up to its maximum value and the top or non-pulling side can be relieved of much of its initial stress. In fact, in many cases the non-pulling side is often relieved of ALL tension and made to run as indicated in Fig. 2.

Fig. 1 shows two pulleys connected by a tight belt. The bearings are under high stress due to this tension, and therefore consume more power than do the bearings in Fig. 2 after the initial tension is relieved. Besides, in Fig. 1, the arc of belt contact is only 180 degs. In Fig. 2 the arc of belt contact is increased by about 45 degs., a very valuable asset in preventing slip, for every degree increase in belt contact increases the pulling power more than 1/360.

This can perhaps be better explained by citing an example. Suppose, for instance, we have a belt that embraces only 90 degrees of a pulley. It will pull a load of 100 pounds. Now, increase the arc of contact to 180 degrees, and it will be found by experiment that the belt will pull 300 pounds. Increase the arc of contact still more and the increase in belt power will be greater in about the same ratio. This, then, is one of the reasons why a slack belt, as in Fig. 2, will often pull up to the limiting strength of the belt. Another reason why slack belts pull so well is that any belt will pull better running at a rapid rate than when running slowly. It seems that at high speed a belt "hasn't time to slip."

I am not claiming that belts should always be run real slack. It is often impossible. Much depends upon the distance between shaft centres, character of drive—gas, steam engine or electric motor—and character of driven machinery. Where the load transmitted is of a highly fluctuating nature it is best not to attempt too slack running. But under no circumstances is it good practice to run belts extremely tight.

Many belts are run slack on shafts that are only 5 ft. between centres, pulleys being 12 to 15 inches in diameter. Where distance between shafts is greater it is easier to maintain slackness, and at great distances, no trick at all.

One of the greatest blessings of the slack belt is the fact that it seldom has to be "taken up." Most of the time spent in caring for tight belts is consumed in cutting out slices every month or so, and then relacing. This is necessary to maintain the tightness. However, with slack belts it is usually necessary to take out a slice only when the pulling and non-pulling sides get so close together that they touch. I know of drives that have run for over 15 years without being touched by a knife. Relacing was necessary, of course, but that was about all. The slack or easy belt is most economical.

Use Idlers Where Necessary

In such a drive as shown in Fig. 3 it will be almost impossible to run the belt slack on account of the short distance between shaft centres and the great difference in size of pulleys. I have seen slack belt drives with short distance between centres, but they are rare. The method pictured in Fig. 3 is becoming popular, and it is a good method. An idler is used to hold the belt down and give it as large an arc of contact with the pulleys as is practicable.

This idler is not and need not be heavy. At least, no additional weights need be added to the idler to effect the desired contact. The weight of the idler alone is enough. We therfore have a condition here that is logically comparable with the slack belt of Fig. 2. It has the same advantages and the same arguments go with it.

One of the big advantages of these "idler drives" is the saving of space and the saving of leather in belts. The idler costs something, of course. It is usually very well machined and has perfectly aligned bearings. At least, an idler should be accurately and well made all around for the ultimate efficiency depends much upon this accuracy. It has been proved in actual tests that a properly made and aligned idler consumes so little power that it is unnoticeable. An idler, on the

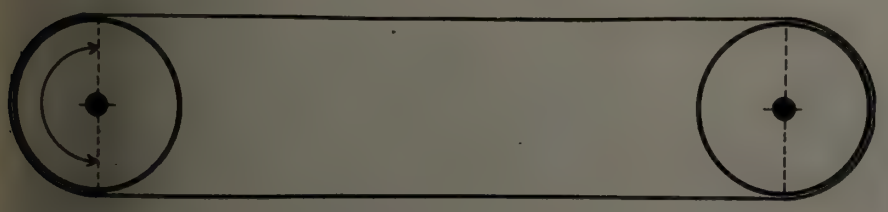

Fig. 1

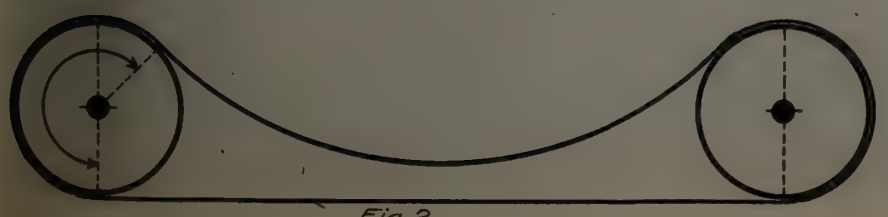

Fig. 2

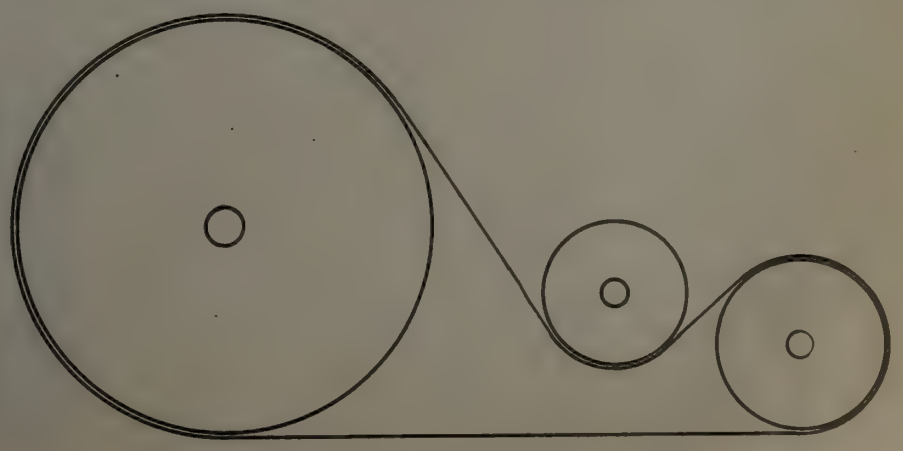

Fig. 3

other hand, with tight bearings and poorly aligned, becomes a veritable "coal eater."

It is plain, then, that an idler drive may cost less than the same drive with machines set farther apart on account of the difference in cost of leather. Nowadays, anyway, leather is pretty expensive.

Cotton, canvas, and other woven belts cannot be used in an idler drive as effectively as leather. Leather is best because of the fact that it can be made endless. Joints of rawhide or metal are rather troublesome factors if used with an idler, on account of the bumping, noise and vibration. Rubber belts have been used with success, however, on such drives.

I do not know why there is so much prejudice against idlers. Perhaps it is because men "think" that an idler consumes just as much power as one of the drive pulleys; but that is not so. A driving or driven pulley consumes power mainly because of the fact that on the "approach" side the leather is stretched and on the "leaving" side the leather has contracted, or vice versa. This adjustment in length occurs on the pulleys and there must certainly be some accompanying friction. Hence the power loss. On an idler there is no adjustment of length. The belt is just as tight on the approach side as on the leaving side. Therefore, there is no belt friction worth mentioning. The only friction occurs in the idler bearing and on account of the good type of bearing used, the perfect alignment and the very slight pressure, that friction, also, is practically nil.

It is evident that for vertical drives a frictionless idler becomes a blessing. We are usually told that vertical belts cannot be run slack, that they must be run tight. But not so. On a troublesome vertical drive, if conditions permit, I do not hesitate to recommend an idler pulley.

Of course, no matter what kind of drive, always place the idler on the slack side.

Investigations which have recently been made by The Contract Record, into the present cost of various building materials, shows that among those materials that have not advanced in price since 1912-13 are included lumber and mill work. In fact the prices for these to-day are said to be considerably lower than during the former period. Many other building materials are included in the list of those which show no advance, or even a decrease, the list being: stone and sand which are somewhat lower in price; brick, which is fully 25 per cent. lower; cement, 10c. to 15c. a barrel lower; lime, the same price; lumber and mill work, no change, or a slight advance, but much lower than during 1912-13; hard wall plaster, no advance; fireproof materials, no advance; varnishes, about the same price, and beaver board, no advance. Materials showing an increase in price include the following: plumbing and heating goods, a considerable advance, because of the higher prices of metal; fireproof doors,, windows, sash, etc., a considerable advance; papers and felts, large advances in certain classes, especially dyed material; metallic roofing, an increase of 10 to 25 per cent.; paints, various increases; glass, an increase of 50 per cent. to 60 per cent., and stocks very difficult to obtain; steel, an advance of 15 per cent. to 30 per cent.; electric wiring, an advance of 35 per cent.

The chestnut blight has already done damage estimated as close to $50,000,000. The disease attacks both American and European species but does little damage to those from Japan and China. Plant breeders by crossing Japanese chestnut and native chinquapin have produced resistant trees.

Forest Conservation During War

Protection Against Fire Loss and Prevention of Waste Making Encouraging Progress

By Clyde Leavitt

"Natural resources lie at the foundation of all preparedness, whether for peace or for war." These are the words of Gifford Pinchot, the foremost advocate on this continent of the better conservation of natural resources.

This statement by Mr. Pinchot is no less true for Canada than for any other country. Its truth is obvious, so far as the great world-war is concerned, since a moment's thought will demonstrate that behind the production of munitions and of all the multitudinous articles of equipment and supplies essential to warfare, there must be great supplies of the natural products of the earth. Of these, the metals and other minerals, and the various woods, come first to mind. All food supplies, including meats as well as grains and vegetables, are dependent upon the productive capacity of the soil, which is the most important of all natural resources, aside from human life itself.

Considering this latter element, human life, it is obvious also that the capacity of a country to sustain population must depend primarily upon either agriculture or manufacturing or both, and the extent to which these can be developed depends absolutely upon the extent of the natural resources available, of which the soil, the metals, the forests, and the water-powers are the most prominent examples.

In time of war, the financial credit of a country is a factor the importance of which can scarcely be over-emphasized. The degree to which this can be realized upon depends to a very large extent on the degree of development of manufacturing industries. Since these, in turn, depend directly upon the extent of natural resources available, the connection between national credit and natural resources is obvious.

Thus we see clearly that natural resources are the determining factors, not only with regard to the production of munitions and supplies, and of credit, but of men as well, who constitute the most essential element in any programme of national defense.

The relationship above outlined for war conditions is equally true in times of peace. Practically every form of human activity is directly or indirectly dependent, either immediately or ultimately, upon the utilization of some natural resource. All agriculture and all manufacture are directly so dependent, as has been shown. Only the boundless natural resources of Canada—her lands, her forests, her minerals, her water-powers—have made it possible for her to attract so large a population from other countries, and with future possibilities in this direction which are as yet almost undreamed of by the average citizen.

These fundamental relationships are as yet realized only in small part by the great public-at-large, and that is the real reason why progress toward better methods of utilization is so slow. A vast amount of agitation is almost always necessary, as a preliminary to the adoption of reform measures, and this is as true of the conservation movement as of any other.

Contrary to the popular idea, conservation does not mean the present locking up of natural resources for the benefit of a distant future. On the contrary, it simply means the avoidance of all un-

---

From the Tree to the Finished Product

On May 1st the Estate James Davidson, Ottawa, Ont., commenced operations for the season at their sawmill located at Davidson, P.Q., on the C.P.R., seventy miles from Ottawa. This mill now has a capacity of 100,000 feet per day and the whole output of lumber is used by the Estate James Davidson in their modern woodworking plant at Ottawa. "From the Tree to the Finished Product" is the slogan used in connection with all the output of the Davidson plant. Being so situated in regard to securing material for their woodworking plant, they are in a splendid position to handle all orders with promptness, no matter how large or small they may be. Their woodworking plant is modern in every detail and fully equipped for turning out all lines of boxes, box shooks, doors, sash, blinds, and all interior finish. At the present time the company are working to capacity on a large shell box order, and upon an extensive shook order for the British War Office.

Estate James Davidson sawmill at Davidson, P.Q.

necessary waste; in other words, it means wise present use, with a view to making non-reproducible supplies, such as coal, iron, etc., last as long as possible, and to using the reproducible resources, such as forests, so as to make them self-perpetuating.

Forest Fire Loss Would Pay War Loan Interest

Everywhere, among the nations at war, the avoidance of all forms of waste is being strongly advocated as a war measure. One aspect of this broad movement, which is receiving less attention than it deserves, is the need for better conservation of our forest resources. It is estimated that the average annual loss by forest fires in Canada is sufficient to pay the interest upon the recent Dominion loan of $100,000,000.

The importance of the forest resource in the internal economy of the country is shown by the fact that the estimated total value of forest products for Canada in 1912 was $182,300,000, or an annual wealth production of $25.68 per head of population. In 1913, nearly eight million dollars was derived, by the Dominion and provincial governments, directly from the sale or lease of cutting rights to publicly-owned timber lands and from royalty and stumpage payments made upon timber so cut.

There are in Canada some 5,000 wood-using industries. The permanence of these industries depends directly upon the perpetuation of the forest resources of the country. It is perfectly obvious, for instance, that, no matter how large its timber limits may be, any large pulp mill must ultimately exhaust its resources of wood if the virgin forest be continuously drawn upon without adequate provision for its replacement on cut-over lands. Yet this is exactly the direction in which many concerns are heading. Pulp and paper mills represent very large investments of capital, and dividends are bound to fail in the course of time, unless necessary provision is made for the perpetuation of the wood supply.

Better methods of protection from fire is the crying need of today, so far as the forestry situation is concerned. Great improvements have been made within the last few years, but the situation as a whole is still far from satisfactory.

In actual practice, the forest has only too generally been treated like a mine, and gutted, with no thought of the future, rather than like a crop, which it really is. The ordinary method of unregulated lumbering followed by fire, as has too often been the practice in the past, is gradually but surely turning vast areas of non-agricultural land into a desert and non-productive condition. Timber is the only crop, aside from game and fur-bearing animals, which these lands are capable of producing. They are, however, capable of continuously adding very great wealth to the country, provided fire is kept out and other necessary measures are adopted for the perpetuation of the forest as a forest. The difficulty arises in securing practical realization of the fact that the forest is a crop, and that its utilization, on non-agricultural soils, should always be so regulated as to provide for the establishment of a new crop, and of successive crops, indefinitely.

This is particularly important as to the lands which have thus far received least consideration, namely, those which, because of their greater accessibility to transportation, have been logged off first. On such lands, stumpage values will always be higher than on lands less accessible, and it is therefore especially desirable, from every point of view, that the natural reproduction should be protected from fire and given an opportunity to reach maturity. Instead, the opposite has been the general tendency, and not only individuals, but the country as a whole must in the long run pay the penalty. To a far greater extent than is the case at present, we should be drawing upon interest, in the form of natural forest growth, rather than upon capital, stored up in the virgin forest. If this were done, our great forest resources could never be depleted.

Brush Disposal Increasing Gradually

Brush-disposal, as a fire-preventive measure, is a feature to which some attention has been given, particularly in the west, and some progress has been made. However, the lumber industry as a whole is still suffering from depression, and the general level of prices is still too low to permit general attention to the matter of brush disposal over the country as a whole. It is believed, however, that even at the present time, particularly in the east, it is practicable to a materially greater extent than is conceded by most operators. At least a beginning could be made, in many cases, by a more thorough clean-up of inflammable debris in the vicinity of settlements, camps, railways, wagon-roads, logging roads and streams, and along the edges of cutting areas. Such action would greatly reduce the danger of fires causing material damage, and would afford vantage points from which to control fires of accidental origin.

One of the most essential features of a forest-protective organization is adequate supervision over the fire-ranging staff. Taking the country as a whole, there is no question but that a very great deal of money is being wasted through failure to provide enough supervision, and of the right kind, to ensure that a dollar's worth of protection is secured for each dollar expended on the fire-ranging staff.

In this connection, the provincial governments of eastern Canada, and the great majority of limit-holders as well, should take careful note of the admirable results that have been secured by the St. Maurice and the Lower Ottawa Forest Protective Associations, and should profit by their example. These two associations have been able to secure the best degree of protection against fire that is to be found over any large area anywhere in eastern Canada. These results have been secured by the adoption of a thoroughly business-like administration, of which close supervision at all points is considered an absolutely essential feature.

Competent Fire Rangers Required

Beyond any doubt, also, the matter of securing a thoroughly competent personnel in the fire-ranging staff is of the utmost importance. It is hardly conceivable that anyone should seriously question this. Yet, in no single government fire-ranging service in all of Canada, so far as is known, are the appointments of fire-rangers clearly and definitely based upon the one ideal of merit and fitness for the position. In every single one, Dominion as well as provincial, the patronage system holds the reins, and party advantage is, as a rule, the primary consideration, with merit and fitness of the applicant secondary. Undoubtedly, many thoroughly competent men are appointed under the patronage system, but the exceptions are too numerous, and the tendency of such a system of appointment is far from conducive to proper ideals of discipline and organization, and the development of a wholly efficient service. In this respect also, the St. Maurice and Lower Ottawa Associations are able to set a good example to the several governmental agencies. These associations, being composed of limit-holders, are able to select their fire-ranging staffs upon the sole basis of merit, and actually do so. On any other basis, the really remarkable results secured would have been impossible to the same degree and at the same cost.

The general tendency of the patronage system was admirably expressed by Sir George Foster in connection with the recent debate upon the estimates of the Public Works Department. His remarks are, however, equally applicable to the several fire-protective services throughout the Dominion. In the discussion referred to, Sir George made the statement that in the whole course of his thirty-four years of public life, he could not point to a single instance where political patronage ever helped the status of the bench, ever helped the status of the Civil Service, ever helped in the economy of their administration the status of public administrators, no matter what function they performed, ever helped a member of parliament in reality, or ever helped a government in reality.

In view of this strong statement and of the very general chorus of approval with which it met, it would seem that material progress has been made toward hastening the day when appointments to at least certain of the public services will be based upon merit rather than upon patronage. Certainly, such action would constitute one of the most effective means of reducing the tremendous forest fire loss sustained each year by this country. This action will not, however, be generally taken unless and until those directly and indirectly interested in securing better forest protection make their influence felt in a concrete way, in favor of this proposition. Not only are all lumbermen included in this category, both individually and collectively, but every citizen of every province as well.

Any action that will tend toward better forest conservation will be a step toward better preparedness, for peace as well as for war.

Important Dunbar Improvements

The Dunbar Engine & Foundry Co., Woodstock, N.B., have made several marked improvements to their widely known Dunbar Shingle Machine this season. This includes an improved jointed table, so arranged on the machine that it is always perfectly rigid and can be automatically swung to one side for the removal of the jointer saw. Self-oiling boxes have been put on all the boxes of the machines. Fraser Limited of Fredericton, N.B., have installed eighteen of these shingle machines in their different mills. The Dunbar people are now working on a new steam compound Logging Engine, of about 10 tons, of a width to go in the ordinary horse road and use horse sleds, suitable for Eastern Canada logging operations. This is being erected under the special supervision of Mr. A. Dunbar, the senior member of the firm. Possibly no machinery man is better known than Mr. Dunbar to the Canadian trade from his long connection in the manufacture of logging equipment. The company are also building this year two sizes of gang edgers for portable mill work. No. 1 will be of about 20,000 ft. capacity, and No. 2, of 40,000 ft. Mr. H. A. Dunbar is manager of this prominent eastern firm.

The waste product of sawmills in the United States including that fed to the furnace as fuel is estimated to be 36,000,000 cords per year, and the equivalent of 2,880,000,000 cubic feet of solid wood substance. About half of it has no use whatever but is usually burned to get rid of it.

Elwood Wilson

Scientific Cruising Creates Profits

How the Laurentide Company Revolutionized its Operations and Saved Thousands of Dollars

By Elwood Wilson

A number of years ago a large lumber company purchased a number of timber limits on the report of a cruiser who ran over the territory in ten days. The writer's men met this cruiser and were in the same neighborhood with him for a great part of the time he was in the woods and had an opportunity to observe his methods. These were very simple, as all he did was to paddle up the main streams and if he saw timber he would guess at its amount and make no effort to see how far back from the stream it extended. The following year the writer was commissioned to make a closer examination of one hundred square miles of this purchase and found that, by actual survey, ninety-seven per cent. of it was burnt clean. The president of this company was much surprised at such a report and was only convinced of its accuracy by an elaborate set of photographs.

This is only one of several instances which have come under the notice of the writer, and can only be explained, in most cases, by the fact that the price of timberlands in Canada has been such that money could always be made and that the cruisers have invariably been low in their estimates. Nevertheless, it is strange that such shrewd, hard-headed men as the lumbermen and paper-mill men, who would not think of buying a piece of machinery costing a few hundred dollars without a careful examination, will expend hundreds of thousands of dollars on the estimating of an ignorant cruiser or foreman who often cannot find his way in the woods and cannot tell one species of tree from another.

A Stock-taking Proposition

No sensible man would buy logs or lumber without having them counted, why should he buy trees without knowing how many he was purchasing? Every good business man takes account of his stocks of raw material; he takes stock every six months or oftener. A cotton manufacturer would not guess at the amount of cotton on hand, or take it for granted that he had enough without carefully measuring it. He would not be satisfied to know that there were some stocks in the next town or perhaps some within a radius of one hundred miles of his mill. He would know exactly to a pound how much there was and where it was located. Why should not the lumberman or pulp man with a large amount of capital invested in raw material take equal pains to ascertain its amount and its location? There are two principal reasons. The first is that timber has always been so cheap and so plentiful that it was almost certain that the supply would be adequate for the wood using industries for a time at least. The second reason is that anything that has had to do with the woods has been left to untrained and relatively uneducated men. It has been supposed that only men who have been born and brought up near the woods, really knew anything about them, and that these men had some occult sense denied to the dwellers in the cities, by which they could find their way in the forest and tell how much timber there was per acre by simply looking at it.

Now that fire and the axe have destroyed so much of our available timber supplies, and the multiplication of wood using industries calls for larger and larger quantities of wood each year, it is absolutely necessary to take account of what we have left, and as competition becomes keener only those businesses can succeed which are run with accurate knowledge of all the factors and not by guess work. The successful manufacturer to-day does not guess what his costs are, he KNOWS, and the lumberman or pulp man can no longer guess how much wood he has for the future, he must know. And, just as the up-to-date manufacturer hires trained accountants, chemists, salesmen, so the lumbermen are coming to employ trained foresters and logging engineers. If you are the owner of timberlands you need to know the following facts:

Where are your limits located?

Are your boundary lines located correctly?

How much of the area is water, swamp, burn, windfall or cut-over?

How much merchantable timber is there?

Just where is it located?

Can you afford to log it at present prices?

Is it growing at a profitable rate, or standing still or dying?

What is the rate of growth?

Is a new crop coming on, and if so, when will it be ready to cut?

For how long a time will your available supply last?

What are the fire risks?

What is the drainage, are the streams drivable, what will it cost to improve them?

How long are the hauls?

How much will it cost to log each section?

The above are not matters of guess work or opinion, but facts which need to be accurately ascertained and should be determined by men who know their business and have been trained to it. If you are ill you do not send for a quack or a bone-setter, but for a qualified physician. You do not ask the office boy to audit your accounts. You employ a chartered accountant, and so, if you wish correct information about your timber lands you need a forest engineer.

Essential Information for a Woods Manager

Just as a general cannot hope to plan and carry on a campaign successfully without accurate maps and information about the country in which he is fighting, so a woods manager cannot hope to carry on intelligently and successfully his logging operations without accurate maps and information about his woodlands. With these he can plan his operations in advance, can check up his annual cut, can tell where to place his jobbers and have right under his hand all the information necessary for carrying on his work. He is not dependent on his woods foremen, and does not have to keep on an unsatisfactory man because he is afraid of losing the information stored in that man's brain. He can keep his records up to date, know just what lands have been cut over and what amounts of timber he can expect from them in future and what he has on hand. He knows just where his boundary lines are and thus avoids the danger of trespassing on his neighbors.

Early in 1905 the Laurentide Company under a new and progressive manager, realized how scanty was the information on hand about its limits and started out to get posted. There was only one map of its holdings and that was very inaccurate. No maps that were either complete or accurate could be obtained from the Government, which even to this day has nothing which can be called a map of its limits under license. There was no record of boundary lines, nor of the amount of timber, not even of the areas which had been burnt over, and during the first month of work trespasses on other companies to the amount of several thousand dollars were discovered and also trespasses of other holders on the company.

In planning this work there were two courses open, either to put on a large number of parties and finish the work up quickly, or to use fewer men and spread the work out over a number of years, beginning with the territory being logged and that likely to be cut over soon and gradually extending the work to the whole area owned. The latter method was chosen and has justified itself as the crews at work gradually gained in experience and knowledge of the country and of working conditions so that the cost of the work was reduced.

The mapping work was done by trained civil engineers and the estimating and other forestry work by trained foresters. The average party consisted of ten men with the usual camping outfit, dog sleds being used in winter and canoes in summer.

Provisions were teamed into the woods as far as possible. In the case of one section they were hauled on horse sleds over one hundred miles. A main camp was established as near the centre of a working district as possible, where the provisions were stored and where a cook made beans and bread which were sent out daily to one or more branch camps, the parties working for the branch camps doing the rest of the cooking for themselves. Good outfits and the best of food were provided and the health of the men well looked after, and in ten years of work, beyond minor axe cuts there was only one accident, and that from the accidental discharge of a revolver. There was one case of snow blindness and two of pneumonia, all of which recovered.

The limit of error in the mapping work was set at one in three

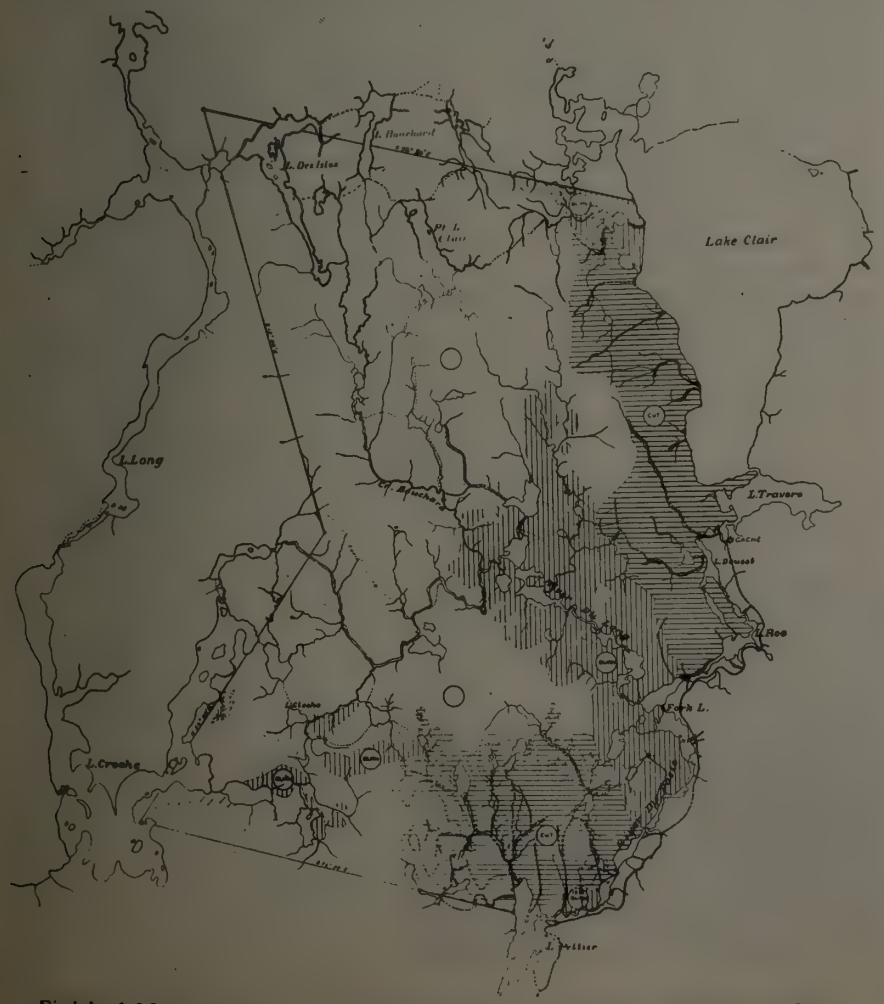
hundred, and when errors larger than this occurred the work was at once done over and the error eliminated.

Work was carried on all through the year, with the exception of the month of June, which was used for vacations on account of the black flies. Summer work showed no difference in cost over winter work, but work done in November and April was the most expensive, owing to the inability to travel on lakes and rivers while the ice was forming and melting.

Boundaries of limits were run first, then circuits were run of fifteen to thirty miles around, checking on the starting points, and using the larger streams, lakes and the portages, and then all the detail inside these circuits filled in. Boundaries of cut-over lands, burns, swamps, lakes, green timber and windfalls were run so that the areas of these could be accurately known. After the field maps were collected tracings of them were handed over to the foresters for the estimation of the timber and its description. By having accurate maps the estimators could lay out their work in advance so that they worked from camp right back to camp again and did not waste any time going to and from work, and by having the drainage mapped, showing the topography of the country, they laid out their estimating work so as to get average conditions in the stands of timber which cannot always be done in the gridiron system of estimating. The average area mapped was fifty square miles a month, that estimated was 65 square miles per month, using a four-man party, and the total was twenty-five hundred miles.

Information Shown on Maps

When the field work was finished a large map covering the whole territory on a scale of two miles to the inch was made which showed all the drainage and the boundaries of our limits and those of all the other holders in the St. Maurice Valley, this map covers practically the whole drainage basin of this river. A second map on the same scale shows the timber conditions over our own limits. A set of maps on a scale of three-quarters of a mile to one inch, each showing a limit, was made, and on these were put all the water, portages, roads, trails and camps and these are blue printed for any employees of the woods departments who wish to travel in the forest. A second set on the same scale shows all the information of the first set and in addition the timber conditions, or lack of them, i.e., boundaries, all water, roads, trails, portages, camps and dams, boundaries and areas of burns, swamps, windfalls, settlers' farms, cut-over and timbered areas. Dates of fires and cuttings are given and amounts of timber which can be taken from uncut timber. Together with these maps are full records of each limit, and both maps and records are kept up to date by surveys made each spring after the cutting is finished.



Finished Map of Limits, Showing Drainage and Timber Conditions. Smal Arrows Show Windfall; Uncolored, Merchantable Timber; Vertical Section Lining, Burnt; Horizontal Section Lining, Cut-over.

Logging Waste Checked Up and Reduced

For several winters and in different sections all over our limits, a crew of two men followed the choppers, and as each tree was felled they measured the height of the stump, the diameter at the stump and at each thirteen and a half foot cut, both inside and outside the bark and the length of the top left, and from these measurements the total merchantable content of each tree was calculated and the results averaged. A set of tables was prepared for white and black spruce, balsam and white pine, showing the total board feet and the total cubic feet and cords in trees of different diameters and heights so that when a certain number of trees were found on an area, by using this table, the total amount of wood which could be cut was easily calculated. In this study the enormous waste caused by cutting high stumps and by leaving large tops in the woods was clearly shown, and the necessity for a careful inspection of cutting operations was demonstrated. The first year that such an inspection service was introduced there was a probable saving of over fifteen thousand dollars worth of timber.

The age of trees was also studied and the rate of growth determined for different species and different conditions. Areas which had been cut over were carefully xamined to find out how much timber was left and what its probable rate of growth would be, so that the amount of timber which could be cut at different future dates could be calculated and also its probable financial value. The results of these studies might well make the owners of timber lands take a little thought for the future, as it was definitely proved that under present methods of cutting to a diameter limit as imposed by the Quebec Government, all of the best and fastest growing timber is cut and the undersized timber which is left is generally supressed and weak or diseased, so that when the larger and stronger trees are removed, those left blow down, or are so shaded by the large hardwoods left that they make very little growth and the hardwoods quickly seed in the openings in the stand and make a forest which is largely without the soft woods which are at present much more valuable. It was found that on large areas of cut over lands the probable amount of timber which would be available after thirty years, spruce and balsam, would hardly pay to go after, if located on any but the most accessible areas. Cutting for softwoods as at present practiced is really a system which helps the hardwoods to increase and multiply, and those coniferous trees which are left must struggle against the most adverse conditions.

Logging Inspection Service Instituted

As a result of the work mentioned above, the logging department of this company instituted a thorough inspection service of its cutting operations. Burnt timber which had never before been used was cut and utilized. The percentage of balsam used in the mill was largely increased. Trees which had previously been left in the woods on account of a small piece of heart rot were cut and brought to the mill and the rot split out, the good part used and the bad part burnt under the boilers. Where tops of less than six inches diameter had been left in the woods they were taken down to four inches and many other economies were introduced. All these improvements were so evident when the facts became known that it shows how necessary it is to have an accurate basis of knowledge in carrying on any sort of work.

The average cost of the field work for the surveys given above was $10.98 per square mile or not quite two cents per acre, and of this cost 77 per cent. was labor. The average cost of provisions, including freight and portaging, was thirty cents per day per man. The estimating of the timber cost six dollars per square mile, or .0093 cents per acre. This latter was the cost of calipering all trees six inches and up in diameter breast high over three per cent. of the area in merchantable timber.

All the drives on the Upper St. John River were reported safe on May 7th. Driving conditions have been ideal this spring with plenty of water in the brooks.

The Adams River Lumber Company, Chase, B. C., have launched a new steamer, a stern wheeler, which will be used for towing and for carrying freight and passengers between the company's camps and the mill headquarters.

On May 10th a boom of logs on Lake Deschenes, ten miles west of Ottawa on the Ottawa River, containing 175,000 logs, broke loose during a severe gale and were driven down the river towards the Chaudiere dam. News of the break was telephoned to Ottawa and the sluices were opened, allowing the logs to go through and averting a jam. The sight was an interesting spectacle to many onlookers as they watched the great quantities of timber crashing over the Chaudiere Falls and shooting down the river. A boom was stretched across the river several miles below the Falls and the logs were captured.

The Growth of Spruce in New Brunswick

Information Secured by Forest Students Showing Rates of Growth of Spruce and Fir in Diameter, Height and Volume

By R. B. Miller

THE subject of the growth of trees, especially of spruce and fir, in diameter, height and volume, is one of the vital questions connected with the survey of the Crown Lands in New Brunswick, and one which must be handled separately from the work of cruising or estimating. Not only are the estimates based upon volume tables made in connection with such a study, but all predictions of future growth require some such scientific basis. The method heretofore has been simply to bring in a cross section of a tree on the stump, counting the rings, and assume that this one tree is a model or sample of the whole forest. At the present time there are two such sections in the Crown Land office at Fredericton, one of a spruce probably two feet in diameter and not over 100 years old, and the other ten inches in diameter and possibly 200 years old. What makes the difference? The first is a white spruce selected under ideal conditions of growth, while the second is a black spruce from a very dense stand in the Miramichi region, from which there are requests to cut undersized material for pulpwood. It is apparent to anyone that neither of these trees can be taken as a criterion of growth on the Miramichi—just as well say that two men picked out of a crowd are ideal or representative men.

The object of this article is to present a preliminary study which was made from the stem analysis of 165 spruce trees, the majority being from the Tobique region and a few being taken from second growth stands on the college forest near Fredericton, the latter measurements being collected from time to time, as made by forestry students. The data are not held to be either exhaustive or conclusive, because such a study would involve the stem analysis of a thousand or more trees carefully selected from the various quarters of the province. Neither is it advocated that stem analysis is the best method of securing such figures. In many cases it is impossible, because of the expense, and the cutting of logs is done at the coldest season of the year, when the taking of the notes is well nigh impossible. Besides, the office work involved in working up the final figures requires much time—time which can be secured from students in the prosecution of certain studies, but not from an office crew to whom you pay wages. In this connection it may be mentioned that Mr. T. W. Dwight, of the Dominion Forestry Branch, has originated a method of taking stem analysis, which cuts down very greatly the field measurements and decreases the office work at least one-half. The accuracy of the method as compared with the old method of stem analysis has not been tried out for typical cases, but it seems possible to secure by means of it all necessary data and in a very much shorter time.

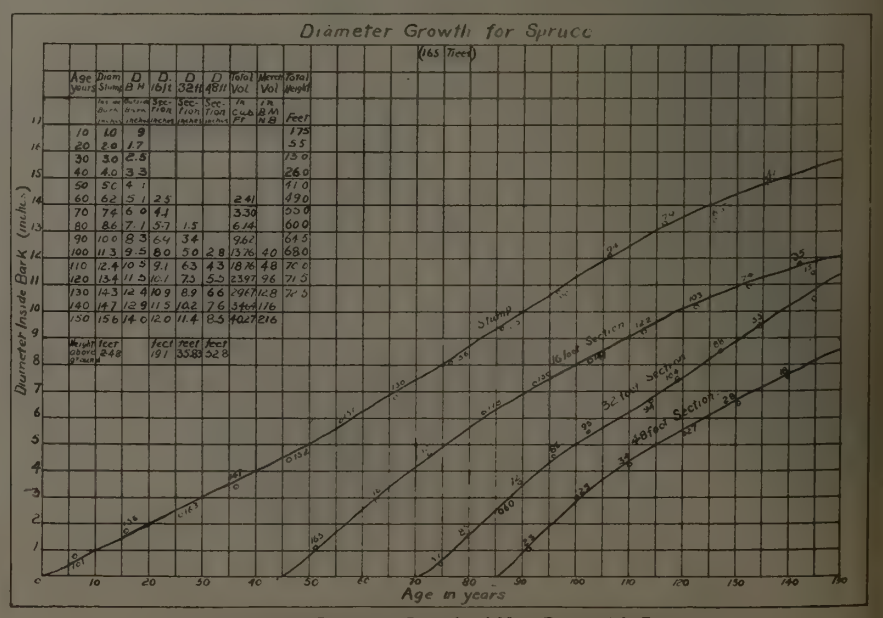
Method of Securing Measurements

The data for the trees from the Tobique region were taken by a forestry student under the direction of R. R. Bradley, of the New Brunswick Land Company. Owing to the cold weather when following the choppers, the results were not entered directly on the stem analysis sheets, but long strips of wrapping paper and a fountain pen were used. Starting on the stump, the student took its height in feet and its diameter inside the bark and the thickness of the bark. He counted the rings in ten year periods from the outside and holding the strip of paper along the average radius, made a mark with the pen at every tenth ring. These actual distances could be scaled with a ruler later and the results entered on regular stem analysis sheets. Going to the top of the first log he did the same, measuring its length in feet, also the length of the top which was left. He also took the diameter of the tree at a point four and one-half feet above the ground (breast high or D.B.H.), and noted any waste in high stumps or in the top which was left. In this operation it happened that all logs were cut to a uniform length of sixteen feet or 16.5 feet, which made his work, as well as the office work, very much easier. Of course, the decade measurements for each section had to be kept separate on his strip of paper, the stump being designated "stump," and the other sections or logs as one, two, three, etc., so that it was an easy matter to take the strips of paper and transfer the results to the regular blanks. One deficiency was found in the figures, namely, that the D.B.H. of each tree was not taken in tenths of inches, a very necessary point, since otherwise it is not easy to establish the relationship between the diameter inside the bark on the stump (D.I.B.) and the D.B.H. outside the bark. This relationship had to be secured in another way and it will be noted on our final curves that there is no regular D.B.H. curve, the results in the D.B.H. column being secured from taper measurement on a large number of trees.

How Stem Analysis is Conducted

As to the work of stem analysis on the college lands—a crew of three men is best—a pole man, a ring counter and a tallyman to record the figures called out by the other two men. If trees are not already felled and cut into log lengths, two additional men would be required for this work. The trees after being felled are cut up into eight foot or sixteen foot lengths, depending on whether they are to be used for cordwood or logs. The other men begin immediately on the stump counting and measuring rings. Where plenty of student labor was at hand, others were assigned to limbing up the tree and piling the brush so as to make a clean operation. The poleman calipers the tree at breast high and measures off the log lengths, also calling out length of tip and other necessary measurements. The ring counter finds the average radius at the top of each log and the stump, and counting the rings from the outside in decades, holds his ruler along a pencil line and calls out to the tally man the distance from the centre to every tenth ring, also recording the odd rings in the centre, and the distance to them. In Mr. Dwight's method, rings are both counted out and measured out from the centre, odd rings being disregarded, since their measurement is usually in tenths anyway, and the plotting in the office of straight ten year periods is very much quicker. Before finishing the analysis, notes are made as to the tree class, that is, whether the tree is a "leader" or is a crowded one in the stand, merchantable length of the tree, length of crown, etc., and the crew moves on to another. Sheets for black spruce and white spruce should be kept separate or separated in the office.

This process requires some time, but the data secured are very valuable since they form the basis for volume tables and for computation or growth in diameter, height and volume. The front of the sheet contains the age of each section, its length, length of tip, etc., so that the contents of the tree in both cubic feet and board feet can be easily computed, as well as the stem form factor, and the growth per cent., providing the number of rings at breast height for the last ten years are measured and counted. On the back of the sheet we have the complete life history of the tree in ten-year periods, from stump to end of last section. As is well known, a tree lays on a certain shell or volume each year on top of that previously there, so that for a tree 100 years old (ten decades) we have ten interior volumes and the measurement to every decade mark represented by the radius measurement, which can be doubled for diameter. Our final curves then, while they are supposed to be for only 165 trees, are in reality for a very much greater number, because there are all the little trees inside of the others, or at least their volume, which is what the forester is interested in. So that, if every tree were 100 years or at the end of every section. This is shown by our final curves



Curves Showing Diameter Growth of New Brunswick Spruce.

which have dots beside which is written 147, 152, etc. This means that that dot or point is determined from the average of 147 or 152 points, the greater number of dots representing greater accuracy. Probably, if the entire number of dots along any curve were totalled, the number would be more than 1,650, because some of them represent not decades but the distance grown in three, four, five, etc., years. Just how the average point or dot was secured is quite another story.

Working Out Tables and Curves

The next step is the working up of the figures on the sheets so that the information desired can be obtained. It can be shown graphically by curves, or, after the curves are drawn, can be put into the form of a table. Probably the first thing desired will be to make volume tables. This presents no difficulty since the contents in cubic feet, or as given by the New Brunswick rule, can be averaged on the basis of similar diameters and heights, evened off by a curve if the results do not run regularly, and put into the form shown by the table for spruce in cubic feet. This table can be used for estimating pulpwood on a tract of spruce, using 90 cubic feet as a cord. Its results are fairly accurate for 165 trees, but we do not claim for it any more than that; it would be much better if it were for 1,000 trees. It seems, however, to run fairly close to a similar table in Cary's Manual, taking corresponding diameters and heights and should be discarded when more trees have been measured. Anyone using it had better check it by measurements on down trees, as a factor of safety. "Safety first" is a good motto for volume tables as well as other things.

The securing of the final curves for growth in diameter, height and volume takes longer and represents the winter's office work of the Junior class of five men during one term, in the year 1915. The diameter growth inside the bark on age is shown for four sections, stump 16 foot, 32 foot and 48 foot sections, and each of them had to be plotted separately before transferring them to the final sheet. These curves were not drawn by chance, but represent almost mathematical averages, the final dot being plotted from its two co-ordinate distances. This means considerably more labor, but much greater accuracy, as it was found that we could not rely on the results read off from a curve made at random.

What is the Value to the Lumberman?

What do these curves show and of what value are they to the lumberman? A single illustration read from them will show this, although the average New Brunswick lumberman might doubt the figures. However, he laughs best who has the figures—at least until more reliable information than the lumberman has yet produced can be submitted. The main thing we are interested in here is how long does it take for a 16-foot log, say 8 inches at the top end, to grow from the ground, not the stump? Taking the line from 8 on the left and running over until it strikes the 16-foot curve and then down until it strikes the bottom line, you read "100 years." To get a second 16-foot log eight inches at the top end takes, from the 32-foot curve, about 122 years from the ground, and for the third 16-foot log or on the 48-foot curve somewhere between 140 and 150 years—say 145 years.

The table in the upper left hand corner of the same sheet on which are the curves, has simply been made by reading off results shown by the curves and tabulating them. It shows the height of a spruce tree at different ages, as well as its diameter on the stump and its D.B.H. That is, at 70 years on the stump, it has a diameter of 7.4 inches and a height of 55 feet. It also shows the volume attained in a given number of years, that is, that at 100 years it will have a volume of 13.76 cubic feet (taking about seven trees to make a cord of pulpwood) or by the New Brunswick rule it should scale 40 board feet. It should be remembered that these figures cannot be applied to the individual tree any more than mortality tables can be applied to the individual. They represent the average of the 165 trees for which the study was made; some trees will do better and some worse, but they should show the performance of the average tree. Compared with figures obtained by Mr. Elwood Wilson on the growth of spruce in Quebec, by a different method, they show almost similar results, that is, in diameter about an inch or over in ten years, or to be exact a diameter on the stump of 11.3 inches in 100 years, a little better than an inch in ten years.

Volume Table for Spruce

(Cubic Feet)

Diameters Breast High (inches) \ Total height (feet)	55	60	65	70	75	80	85	90
9	6.4	7.5						
10	9.5	11.0	13.0	14.5	16.0	16.9		
11	13.0	15.0	17.3	19.5	21.2	22.5	25.0	
12	16.6	19.0	22.0	24.5	26.5	28.0	31.6	
13	21.0	23.7	28.8	30.0	32.0	34.0	38.0	
14	25.0	28.0	31.6	35.3	38.1	40.1	45.0	
15	29.3	33.0	36.6	40.7	43.5	46.3	51.7	53.6
16		38.0	42.0	46.3	48.2	52.6	59.0	61.4

The Palmer-McLellan Shoe Pack Company, Limited

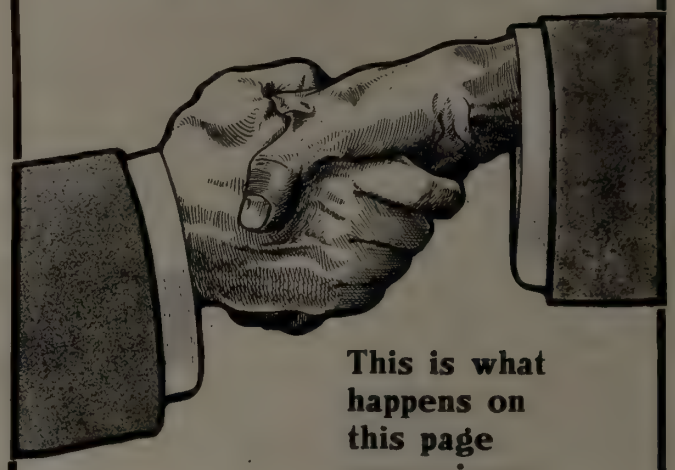
The Palmer-McLellan Shoepack Company, Limited, Fredericton, N. B., are one of the several large eastern firms catering to the lumbermen's needs in footwear. The company was founded in 1912 by the late John Palmer, whose long connection with the shoepack manufacturing business made him known from coast to coast. Mr. Palmer was the first man to make shoepacks in Fredericton, N. B., and was the originator and founder of the first Oil-tanned Leather and Shoepack Company. Associated with Mr. Palmer in the founding of this company was Mr. W. A. McLellan, financial and manufacturing manager. The present officers of the company are Messrs. W. A. McLellan, J. E. Palmer and J. H. Richards. Mr. Palmer is the son of the late Mr. John Palmer, and Mr. Richards has been connected with the lumber industry in New Brunswick for many years. The factory shown in our illustration is a modern one in every respect and has a capacity of 600 pairs a day. A modern tannery is operated in connection with the factory and over one hundred employees are employed. In addition to the full lines of waterproof shoepacks and sporting boots, the company manufacture a line of workmen's boots, specially suitable for the lumber trade. All goods are put out under the "Palm-Tree" design, with the "Palmer" name as the trademark, which has now become favorably known throughout Canada.

Plant of Palmer-McLellan Shoepack Company, Limited, Fredericton, N. B.

Mr. Buyer

Are you in the market for a special bill of lumber? Would you like to pick up a real good second-hand planer or perhaps some logging equipment? Have you a vacancy in your plant for a filer or other employee? If you answer "Yes" to any of these, advertise on this page. It is the "Master of Ceremonies" and will introduce you to the man you want.

The Master of Ceremonies



This is what happens on this page every issue

Mr. Seller

You are looking for the man who is looking for you—you have for sale what he wants. All that is needed is an "Ad" on this page to bring you together. Appeal to this "Master of Ceremonies" and send us a small ad. today. What can we sell for you—or perhaps we can find you a job.

Send along your ad.

WANTED & FOR SALE DEPARTMENT

PUBLISHER'S NOTICE

Advertisements other than "Employment Wanted" or "Employees Wanted" will be inserted in this department at the rate of 15 cents per agate line (14 agate lines make one inch.) ($2.10 per inch. each insertion, payable in advance. Space measured from rule to rule. When four or more consecutive insertions of the same advertisement are ordered a discount of 25 per cent. will be allowed.

Advertisements of "Wanted Employment" will be inserted at the rate of one cent a word, net. Cash must accompany order. If Canada Lumberman box number is used, enclose ten cents extra for postage in forwarding replies. Minimum charge 25 cents.

Advertisements of "Wanted Employees" will be inserted at the rate of two cents a word, net. Cash must accompany the order. Minimum charge 50 cents.

Advertisements must be received not later than the 10th and 26th of each month to insure insertion in the subsequent issue.

Wanted–Lumber

Sawdust Wanted

Wanted to contract for sawdust. Apply M. Brennen & Sons, Hamilton, Ont. 9-10

Maple and Hickory

Wanted, Maple and Hickory Axles, dry. Jackson Wagon Co., St. George, Ont. 8-11

Basswood Wanted

No. 2 Common and Mill Cull. Winter cut preferred. Apply Firstbrook Brothers, Ltd., Toronto, Ont. 8-t.f.

Wanted to Buy

750,000 ft. 2 in., 2½ in., 3 in. and 4 in. log run Birch. Terms 75 per cent. cash on shipment, balance on arrival. Apply P. O. Box 643, Montreal, Que. 9-12

Wanted

We are in the market for a large quantity of 2-in. Spruce Plank 4 in. and up wide, 8 feet and up long. Good merchantable stock. Kindly write us your lowest price. Box 334, Canada Lumberman, Toronto, Ont. 5-t.f.

Wanted

Several cars 16/4 Birch, No. 2 common and better grade. Must be dry and ready for immediate shipment. Write us your lowest price and full particulars. Box 333, Canada Lumberman, Toronto, Ont. 5-t.f.

For Sale–Lumber

For Sale

Seven cars round Rock Elm timber, 12 to 20 in. diameter top end, 20 to 50 feet long. Choice stock. Hall Bros., 174 Mutual St., Toronto, Ont. 10-13

For Sale

500,000 Western Ontario White Pine Logs. Can be sawn to your order. Those interested please write Hall Brothers, 174 Mutual St., Toronto, Ont. 9-12

Hemlock Ties

FOR SALE—Considerable quantity of hemlock ties suitable for Electric Railways, Sidings, etc., ready for immediate shipment. Monteith Bros., Rosseau, Ont. 6-10

Lumber For Sale

200 Pieces 1 x 15 and up 22 ft. Cypress.
375 Pieces 1 x 15 and up 24 ft. Cypress.
Clear for boat building, in stock at Montreal

GEO. C. GOODFELLOW,
Montreal, Que.

For Sale

65,000 Feet GOOD DRY B. C. FIR

2½ to 5 in. thick by 6 to 12 in. wide. 60 ft. to 78 ft. long. Immediate delivery. George Kersley, 224 St. James Street, Montreal. 7-10

For Sale–Machinery

Machine For Sale

Two second-hand McGregor-Gourlay Q. Y. Planers and Matchers, one 9-in., one 15-in. wide; in good condition, ran every day till October, when fast feed Matcher was installed. Located in Saskatchewan. Box 384, Canada Lumberman, Toronto, Ont. 8-11

Producer Gas Engine

For sale, second hand 45 H.P. Producer Gas Engine with gas producer, air pump for starting, blower, and small gasoline engine complete and in good condition. Burns pea coal, could be operated at a cost of about $1 per day. Will be sold at a very low price.
Canadian-Warren Axe & Tool Company, Ltd.,
7-10 St. Catharines, Ont.

Machinery for Sale

Second-hand saw mill engine, Corliss type, in perfect condition. A snap for quick sale. Box 400, Canada Lumberman, Toronto, Ont. 10-10

Timber Limits and Mills

Timber limits for sale in the District of Algoma, also a Band and Gang Saw Mill. For particulars apply to Geo. Niebergall & Son, Parry Sound, Ont. 11-13

Machinery For Sale

A small "Ad" under this heading, telling of what machinery you have for sale, will immediately put you in touch with buyers. Send us a list of machinery items and we will quote you on a small "Ad." Send the list now, before you forget about it. 1-t.f.

FOR SALE
Woodworking Machinery

The following second-hand machines have been placed with us for sale:
1 Woods No. 32 Matcher; 1 Goldie 10-in. Moulder; 1 Goldie 24-in. Matcher; 1 Cowan 42-in. Sander; 1 Jackson Cochrane 36-in. Sander; 1 Egan 36-in. Single Surfacer; 1 McGregor Gourlay 2-drum 30-in. Boss Sander; 1 Egan 30-in. 2-drum Sander; 1 CMC 8-in. 4-side Sticker.

P. B. Yates Machine Company, Limited,
10-t.f. Hamilton, Ont.

For Sale

Following Second-hand machinery
Water Wheel, 4 ft., with 5 in. shaft 14 ft. 2 in.
Eight Gates 20 in. wide, depth 3 ft. 8 in.
Draft tube 14 ft. to elbow (elbow 2 ft. 2 in., diameter of draft tube 4 ft. 6 in.)
Rope Drive, big pulley 6 ft. 3 in., face of pulley 2 ft. 8 in.
Small Pulley 3 ft. 2 in., face 2 ft. 8 in.
Friction Clutch, 6 standards and boxes, also rope drive idler.

Apply Brome Lake Electric Power Co.,
10-10 Waterloo, Que.

Machinery For Sale

Refuse Burner, 24 ft. diam. 100 ft. to spark arrester; all grate bars, 4 base doors, lined with fire brick; in good condition.

Smoke stack 7 ft. x 130 ft. to spark arrester, a1 condition.

Three Boilers, 6 ft. x 16 ft.; 70 4-in. tubes, 2 fire doors, 2 draft doors, fronts in a1 condition.

One No. 8 Buffalo Forge Co. Blower.

One Dean Duplex Steam Pump; 2—14 x 14 steam end; 2—12 x 28 water end, valves and piping.

All angle iron frames and galvanized roofing for large fire room.

All or any part at bargain prices.

Box 390, Canada Lumberman, Toronto, Ont. 10-12

Wanted–Employment

Advertisements under this heading one cent a word per insertion. Box No. 10 cents extra. Minimum charge 25 cents

SAW MILL FOREMAN open for position. Eighteen years' experience. Has had good success in handling men. Can furnish best references. Box 403, Canada Lumberman, Toronto, Ont. 10-13

EXPERIENCED LUMBERMAN wants position. At present employed as sales manager. Can furnish A1 references. Reason for change, company going out of business. Box 401, Canada Lumberman, Toronto, Ont. 10-11

DOUBLE BAND SAW FILER wants position, first-class references.

BAND MILL FOREMAN wants position, first-class millwright, and can handle men to good advantage. Box 359, Canada Lumberman, Toronto, Ont. 6-11

Wanted–Employees

Advertisements under this heading two cents a word per insertion. Minimum charge 50 cents.

INSPECTOR WANTED—A man capable of inspecting both hardwood and softwood, and shipping same. State references, experience and salary expected. Box 394, Canada Lumberman, Toronto, Ont. 9-12

Business Chances

For Sale

To close an Estate, the valuable Lumber Mill known as the Picnic Island Mill at Little Current, Ont., Georgian Bay, is offered for sale. Capacity about twenty million feet of lumber per season. Extensive docks with sixteen feet of water and booming capacity for about fifteen million feet of logs.

Picnic Island, which is freehold property, consists of thirty-seven acres, containing the mill and twenty dwelling houses for employees. Superior drying grounds. Can ship by rail or water. For further particulars write,

James Battle, Thorold, Ont.
Administrator Estate of Late John Conlon,
or
Thomas Conlon, 44 Church St.,
10-10 St. Catharines, Ont.

Sawmill

For Sale—Complete equipment. Plenty available jack pine. Owner retiring. C. R. Allison, 514 Traders Bank Building, Toronto, Ont. 10-10

Business Opportunity

Make your opportunity knock at the door of every Lumberman in Canada by placing a small "Ad" about it in this column. Our rate is $2.10 per inch per issue. Now is a time when monied men are seeking good bargains. What have you to offer? 1-t.f.

Miscellaneous

Timber Limits For Sale

Berths No. 2 and No. 4 Nipissing, and Berth No. 4 Gurd. Hemlock, Birch, Pine and Spruce. Would sell berths separately. Close to Lake Nipissing. Great opportunity for jobbers on Nipissing berths. For particulars address Box 381, Canada Lumberman, Toronto, Ont. 7-10

Pocket Telephone for Woodsmen

Forest Officer R. B. Adams, of Missoula, Mont., has invented a portable telephone for the use of patrolmen of the National Forests. The outfit, made of aluminum, weighs only two and one-half pounds; the one formerly used weighed ten pounds.

A field man equipped with the new telephone, a few yards of light emergency wire and a short piece of heavy wire to make the ground connection, can "cut in" anywhere along the more than 20,000 miles of forest service telephone lines and get in touch with the headquarters of a supervisor or district ranger. Removal of the insulation from a few inches of the emergency wire is all that is necessary to make contact with the line wire.

The instrument does not ring the bell of the receiving telephone, but instead causes a screeching sound from a small megaphone-shaped apparatus, known as a "howler," at the ranger station telephone. If the field man needs to talk with some one elsewhere on the line the ranger station instrument can be used to ring up the person wanted.

Forest officers say the portable 'phone is especially valuable in reporting fires and other emergencies, with the least possible delay.

Maple for Cross-Ties

Ten years ago maple was practically unknown as a railway cross-tie, being included in the list of woods that decayed too quickly for this purpose. Treating with creosote renders it immune to decay and it now figures quite largely under the head of "miscellaneous hardwoods," while in some regions it constitutes a considerable percentage of the ties treated. As clear hard maple is too valuable for flooring and other purposes to be used for ties, the tops and smaller trees are utilized for treatment. Maple takes creosote treatment fairly well, being, in this respect, very similar to beech and red oak. It does not treat as uniformly as some of the other woods, but absorbs creosote sufficiently well to become fully protected against decay. As with most other woods which do not take full penetration, it is best to bore and adze maple ties before treatment.—American Forestry.

Douglas Fir is Useful Wood

In the "Illustrated London News" recently, there appeared a picture of the H. M. S. Simulation, a battleship constructed of wood, which, after serving various purposes known only to those in charge of naval operations, is shown stranded at Mudros, Isle of Lemnos, formerly the base for naval and military operations in connection with the Dardanelles. It appears that the dummy battleship was constructed at Belfast, the material used being Douglas fir, mainly from British Columbia.

Making artificial silk from sawdust and other lumber waste is the latest experiment of the United States Forest Products Laboratory at Madison, Wis. The use of artificial silk made directly from wood is increasing by leaps and bounds. Originally its principal use was in the manufacture of braids and trimmings, but recently the manufacture of hose from artificial silk has become an industry of vast importance. Other uses for artificial silk are woven goods of all kinds, linings, tapestries, etc., neckties, ribbons, sweater coats, etc. About five and one-half million pounds of artificial silk are used annually in the United States. There are several methods of manufacture, but that from wood pulp is usually made by treating the wood pulp with caustic lye, after which it is dissolved in carbon disulphide. This is then diluted with more caustic lye to form a viscose which is allowed to age for some time. It is then forced through dies to form threads which are hardened by a treatment with sulphuric acid, ammonium sulphate, and sodium borate, or formic acid. After washing and drying, the silk is ready for use. The laboratory is investigating the artificial silk problem as a possibility for utilizing wood waste and has on hand a variety of articles made from this material .

The establishment of a $4,000,000 ship building and ship repairing plant in or within a few miles of Vancouver may be one result of the passage of the government's shipping measure now in course of second reading at the Capital. Although many marine construction companies both at Vancouver and Victoria have definitely indicated their intention to proceed immediately with the construction of deep sea craft under the bond guarantee proposals of the government, none have yet considered launching upon a programme of this magnitude.

Review of Current Trade Conditions

Ontario

The country trade in Ontario has been rather quiet during the past fortnight on account of unsatisfactory weather conditions. Now that improved weather is in sight, conditions are a little better. People who have been anticipating building operations are now finding a little more time to attend to them. Up till now the farming trade has been held back by the lateness of the seeding season, which is about three weeks behind time. The farmers have been so busy with their work that they have not been able to think of anything in the way of building. A few of the farmers have recently been making their appearance on the market and it is expected from now on that their demand will be more active. Some of the small towns are comparatively quiet, others are fairly busy. Conditions this year cannot be compared with previous years at all, on account of the lateness of the season. On the whole, wholesalers who have been about the country during the past fortnight report that trade is better than it was two or three weeks ago.

In the larger manufacturing towns conditions are not showing any important change. Building permits are very low and there is not much prospect of a great volume of business in the near future. At Hamilton, the trade is busier than at most points, but even there the trade is spotty, being active one week and quiet the next. Brantford trade is improving a little, while at London there is not much to report. In nearly all the larger centres the trade is chiefly made up of orders for sorting up stocks wherever they have been depleted.

The hemlock trade is quieter, its activity during March and April having declined in May. Prices are unchanged. Shingles are strong, XXX B.C.'s being quoted at $3.35. The trade is altering so as to favor XXX and XXXXX and manufacturers are apparently stopping the production of XXXX.

Eastern Canada

The lumber trade at Montreal is quiet so far as the soft wood section is concerned, but there is an active demand for hard woods, growing out of the revived activity in the piano and furniture industries. In the general local trade the quietness is the result of lack of building operations. The United States trade continues on a fair scale. Since the opening of navigation a small amount of lumber has been shipped to the United Kingdom and freight rates have again risen, 375s. being quoted by the steamship companies and very little space being available at that figure. Exporters are predicting 500s. unless the Government comes to their assistance.

There is very little change to report in connection with the export trade at St. John, N.B. There are plenty of enquiries from Great Britain, but the problem of making deliveries is still as difficult as ever to solve, as freight rates continue very firm at 360s., and practically no vessels are offering except those furnished by the Admiralty. All the mills are now sawing, largely on English deals, with one or two mills operating for the American market. Local conditions at St. John show a little improvement. The American market is still quite firm. Lath are firm and unchanged. Shingles are rather quiet.

The market for spruce at Boston continues very firm and the demand is increasing. The quotation on frames by rail to Boston is firm at $28. For 9-in. frames $29 is required, and for 10-in. $20, while 11-in. and 12-in. are placed at $31. Random is in active demand and price advances are expected. At present, the range in quotations is as follows:—2 x 3, $21.50 to $22; 2 x 4, $22.50 to $23; 2 x 5 and 2 x 6, $21.50 to $22; 2 x 8, $25 to $26; 2 x 10, $26.50 to $27; 2 x 12, $27.50 to $28.

The demand for spruce boards is improving with the betterment in the weather, and sales are now quite extensive. Dry covering boards, planed on one side, 5 ins. and up wide, 8 ft. and up long, are bringing $22. At New York, the demand for spruce is steady and prices are firm. Boards are bringing the highest prices in their history.

The demand for hardwood at Boston continues good and prices are firm. Several advances in quotations have lately been reported. The demand is fairly well distributed, with maple, birch and plain oak getting a little the best of it. The hemlock situation at Boston is improving steadily. Eastern clipped boards, 10, 12, 14 and 16 ft., are firm at $23.

The shingle market is improving at Boston. Some manufacturers are holding out for $3.60 as their lowest figure for white cedar extras. For clears the usual price now is $3.20 and for second clears $2.40. Red cedar shingles are also very firm, as much as $4 having been quoted for the best brands of extras. The demand for lath is improving steadily.

United States

The regularity with which reports upon trade conditions in the United States refer to nothing else but prosperity is becoming an old story. The Federal Reserve banks made a statement public recently and not a single unsatisfactory condition was reported in business or industry throughout the whole of the United States. Building operations in the cities and larger towns continue to show increases. In the country districts, however, the building operations have not shown so much increase as might have been expected, as weather conditions have not been favorable. Ordinary grades of lumber for building purposes have been affected by this situation. Manufacturers are not now looking for any large demand from the rural districts until the summer has advanced considerably. In the manufacturing centres, building operations are quite active.

The southern pine industry has been affected rather seriously of late by the operations of parties sending out lists of transit cars containing stocks at low prices. It is expected that a strong effort will be made by the association to reduce this evil. There are plenty of orders on file for southern pine and the outlook for a greater demand is encouraging.

On the Pacific Coast, trade conditions are fairly satisfactory. The cargo trade is being restrained by lack of vessels, but the outlook in the markets reached by rail delivery promises to offset the cargo shortage. Stocks at west coast mills are steadily decreasing. Assortments at many points are badly broken. An especiallysatisfactory feature from the United States point of view is the fact that Canadians are so completely absorbing the lumber production of British Columbia and the latter are not attempting to market their production in the United States to any great extent.

The hardwood situation continues on a very satisfactory basis in all respects. Many mills report considerable decrease in their stocks on hand. This is particularly the case in regard to oak, poplar and chestnut.

An important feature of the lumber trade situation today is the increasing demand for low grade material for box making. Fibre pulp has advanced in price sufficiently to curtail the use of the fibre container and box makers are benefitting in proportion. The wooden box manufacturers are busier now than they have been for many months and are using up large quantities of low grade lumber. Automobile manufacturers are also buying much low grade material to use for crating their cars so that they may be shipped on gondolas. An average automobile crate requires approximately 1,000 feet of lumber and this new demand is absorbing millions of feet of low grade stuff.

Great Britain

The most important question in connection with the lumber trade in Great Britain today is the remarkable difficulty in doing any business in White Sea goods. The tonnage question still presents a practically impassable barrier, and so far as anyone can foresee at present, is likely to continue so during the rest of the war. Sales do not seem to be possible, either c.i.f. or f.o.b., as shippers are unable to find vessels any more than the buyers can. The outcome is a deadlock.

The spruce market still retains its cheerfulness. Prices are exceptionally high and further advances are reported almost daily. Spruce is in great demand in many districts and as deliveries are fairly satisfactory, the trade is placing great confidence in it. Lumbermen in the United Kingdom are wondering when some kind of a check will be placed upon what they consider to be the extortionate freight rates charged by vessel owners. The timber trade is completely in shipowners' hands and other trades are in a similar fix. Rates from the White Sea, for instance, for the United Kingdom, will soon reach 400s. at the present rate of going.

The London market has been quiet of late. It is reported that high prices are putting an end to anything in the shape of speculative dealing. Quotations for spot goods continue very firm, and there appears to be no prospect of cheaper wood in the near future. There is, however, an increased quantity of stock going into consumption, and a fair amount of activity in general work.

At Liverpool and Manchester there has been quite a falling off in the demand of late as a result of consumers not caring to buy at the present abnormally high prices. Such prices are certain to cut off the production of every article that is not a necessity. A little fresh stock continues to arrive, but prices continue to advance and stocks remain about steady. The government demand and the great

View of Mills in Sarnia.

BUY THE BEST

Retailers and woodworking establishments who like to get A1 NORWAY and WHITE PINE LUMBER always buy their stocks from us because we can ship them on quick notice. It pays to have the goods, but it pays better to "deliver" them.

We also make a specialty of heavy timbers cut to order any length up to 60 feet from Pine or B. C. Fir.

"Rush Orders Rushed"

Cleveland-Sarnia Sawmills Co., Limited

SARNIA, ONTARIO

B. P. Bole, Pres. F. H. Goff, Vice-Pres. E. C. Barre, Gen. Mgr. W. A. Saurwein, Ass't. Mgr.

scarcity of freight room are combining to keep up values of soft woods and higher figures are being quoted continually. Several small c.i.f. sales are reported at Liverpool recently. The freights on these parcels have been in the vicinity of 340s. from the St. Lawrence and lower ports. Spruce arrivals are rare and prices remain firm. the last quotation reported having been £29 10s. c.i.f. for an ordinary specification. Oregon planks are very scarce and prices are advancing. Oregon longs have gone off the market. There have been no arrivals of birch for some time. Planks are very scarce at £31 to £32 per standard for Halifax and St. John stocks.

At Manchester, prices continue to alter from day to day, always with an upward tendency. Recent quotations are about as follows:—spruce £30 for scantlings; floorings £31 10s. to £32 c.i.f.; pine 1st, 3 x 11, about £56.

Market Correspondence

SPECIAL REPORTS ON CONDITIONS AT HOME AND ABROAD

St. John Trade Report –U. S. Market Strong

St. John, N. B., May 6; (Special to the Canada Lumberman):—Very little change has taken place in the foreign markets during the past two weeks. From the British market come plenty of chances to sell good parcels of deals, but how or when deliveries can be made remains to be seen. Tonnage seems to be even more scarce than a month ago. Rates for British ports remain firm at 360 shillings, with practically no boats available, excepting those supplied by the Admiralty, who, in fact, are the only heavy purchasers at the present time. The orders being shipped out of St. John to the Allies contain a very large percentage of scantlings 3 x 4, 5 and 6 in., for trenching, and spruce boards for huts, etc. Prices for these sizes remain firm around about $16 for scantling and boards. All the mills are now sawing, largely on English deals, with the exception of Messrs. Stetson, Cutler & Company, and the Miller Estate, who are sawing for the American market. Locally, conditions show some improvement, but not very marked. Very few houses are being erected, and seemingly there is no improvement ahead for the near future in this direction. Some factories are quite busy on some large orders for the McAvity plant and for the Sugar Refinery additions. These two large operations are being carried on by Messrs. Grant & Horne, contractors, and are the only two large works being erected. It is to be hoped that many such plants will be erected during the coming year, as they will be a stimulus to trade both in erection and operation.

The American market remains in a good firm position, and it is to be hoped it may continue so for the coming year. Prices are unchanged from our last quotation.

Laths still hold a very firm position, and at present show little change for any decrease in price.

Shingles are still dull and are at least one dark spot on the market.

The drives at the head of the St. John River are progressing very favorably, but will need some rain before long, as we have been without any rain for a month, and the river is now at a standstill. Bank logs are coming along freely and their prices are unchanged during the last two weeks.

Hardwood Moving Well at Montreal

Montreal, May 12th (Special to the Canada Lumberman):—Except for the hardwood section, trade is quiet. For hardwoods there is an active demand, due to the revival in the piano and furniture industries. For a long time the hardwood business was very dull, but it has now taken a decided turn, accompanied by a better market for veneers.

The slackness in the general local trade is owing, of course, to the comparative inactivity in building. The permits show how this has declined. During April the total was $435,805, a decrease of $538,086, while for the four months values were $919,225, a falling off of $946,602.

Orders from the United States are on a fair scale, but have slackened a little in consequence of an embargo on the Williams Line. There is a congestion of cars at Albany, and the railway companies decline to receive further lumber at that point. Application is to be made to levy an additional 2c. per 100 lbs. on lumber going by this route, when the embargo is lifted.

With the opening of navigation, a small amount of lumber has been shipped to the United Kingdom. As was expected, rates have again risen, 375s. being quoted by the steamship companies, and even at that there is little space available. It is predicted by some exporters that unless the Government comes to the rescue, 500s. will be asked before the season is over. Another tramp has been chartered to load from this port, and advices from Quebec state that a tramp has loaded there. A very large quantity could be shipped from Canada were boats available, but at present there seems to be no hope of an improvement in the situation.

Sulphite continues to be a strong market, and is likely to continue so for some time. The mills are working at full pressure, and are able to sell all their production. Ground wood has also advanced, while the demand for newsprint is still very large. Owing to the activity in the pulp markets, pulpwood is in very good request.

Box making is slow. One firm is very busy on an old order for shell boxes, but another company which was formed mainly for the purpose of manufacturing this class of box, and which secured one of the early orders, is disposing of its machinery. Another box-maker, who, for a while was very busy on Government work, has closed his factory for the time being. The Munitions Board is very strict in inspecting the work, and the lumber is now inspected before it is made up into boxes, in addition to the ordinary examination after the boxes are completed.

French Government Loading Steamers at Parrsboro

Parrsboro, May 6th; (Special to the Canada Lumberman):—A fine three-masted schooner of 424 tons register was launched at Port Greville, N. S., a week ago today. This is the first of a fleet of eight schooners, ranging from four hundred tons upward, which will be built along the Parrsboro shore this season. The new vessel has all the latest improvements in outfit, and is said to be one of the best vessels ever built in this vicinity. She will take a cargo of piling to New York and on her return will load deals for the United Kingdom.

The scarcity of trans-Atlantic tonnage continues and appears to be getting more pronounced. Only one deal vessel—a schooner—has sailed from this port up to the present. Usually at least two or three steamers are loaded and away before this date. Now none is loading and there is no immediate prospect of any arriving. Several schooners are expected shortly, but something larger is urgently needed. One Parrsboro shipper has sold two large cargoes to the French Government for immediate delivery on the condition that the government shall provide the carriers. It is expected that the two French steamers will arrive this month. Their coming will help to relieve the tension, and may lead to a solution of the tonnage problem.

Five American schooners have loaded lumber here this spring for United States ports. Two of the vessels were built more than fifty years ago, and the youngest or newest was over thirty years old. This is a practical illustration of the scarcity of bottoms, and may be regarded as a proof that other freights are more profitable than lumber freights. Apparently only vessels unfit for other trades can be got to carry lumber, although there has been a big advance in lumber freights. Of course, the coatsing rates are low in comparison with trans-atlantic prices, and they are also low when compared with freight from the West Indies and South America.

The breaking of a boom at Portapique recently set adrift lumber valued at $10,000, belonging to a Parrsboro operator. A considerable portion of the lumber was recovered.

North Shore Conditions Favorable

Thessalon, Ont., May 1st; (Special to the Canada Lumberman): The past winter was a favorable one for woods operations on the North Shore. There was abundance of snow and frost. The ice on the lakes was excellent and the lumbermen got their logs at a reasonable cost. The weather for driving could not be improved upon. Water in the rivers and lakes is very high and the drives are progressing splendidly. All the drives and running streams will be out very early. The ice in the inland lakes had not gone out a day or two ago; consequently these drives had not got under way as yet, but any quantity of water behind them will come along rapidly as soon as the ice clears away. The water on the Mississaga and Spanish rivers is very high, so much so that there has been danger of the booms at the mouth giving way. The lumbermen have taken the precaution to have storm booms stretched outside in case anything of this sort should happen.

The mills are all running at full capacity. There appears to be an abundance of men for both the mills and the drives.—Algoma.

THE HARRIS ABATTOIR COMPANY, LIMITED

TORONTO, ONT.

MR. LUMBERMAN:

When you are next purchasing supplies of any of the products mentioned below, we would appreciate your enquiry so that we may quote prices.

We know that we can give you satisfaction, as regards "prices," "quality of goods," and "service."

With reference to "service," we are prepared to give delivery weekly by refrigerator cars to practically every section of Ontario, Quebec, and the Maritime Provinces. It will pay you to get in touch with us before placing your order.

THE HARRIS ABATTOIR COMPANY, LIMITED

Jones Underfeed Stoker Installations

The Jones Underfeed Stoker Company, Limited, of Toronto, are installing three new stokers for the burning of combination fuel—paper mill refuse and coal—for the sulphite mill at the E. B. Eddy plant, Hull, P. Q. This makes 23 stokers they now have installed in the Eddy plant. They have also recently supplied six stokers to Price Bros., of Quebec, for their Kenogami mill.

A Monster Melting Pot

The melting pot represented in the accompanying illustration has a capacity of 35 tons and is claimed to be the largest in the Dominion of Canada. The great mass of molten metal contained in this pot when it is in operation is a sight worth seeing. The Canada Metal Company of Toronto make use of this pot to mix their raw material in the production of shrapnel bullets and babbitt metals. The process, from the ingot metal to the finished products, illustrates forcibly the value of taking every precaution to secure metals containing the necessary percentage of each metal to give efficiency. The old fashioned way of taking tin, antimony, etc., melting and pouring into moulds and calling it babbitt metal may have passed muster many years ago, but is not suitable for present-day requirements.

The Canada Metal Company have the most modern appliances for making and testing their babbitt metals before they are approved as satisfactory for the special purpose for which they are intended. They have a well-equipped laboratory on the premises, which is presided over by a metallurgist who tests everything thoroughly before it goes to the large melting pot. After the first melting process everything is again tested in the laboratory, by the chemist, in order to make absolutely sure that the alloy is perfect. When the babbitt metals are ready for use and before they are passed as "O.K." they are put through a severe test on a friction testing machine. Unless this test gives satisfactory results in every detail the metal is rejected.

For shrapnel bullets the alloy must be absolutely perfect and it is only by melting a large quantity at a time that a perfect and uniform quality can be guaranteed.

Enterprise Steel Ranges

One of the best known manufacturing firms turning out steel ranges for logging and contractors' camps is that of the Enterprise Foundry Company, Sackville, N. B., who are known to practically all readers of the Canada Lumberman by reason of the excellent steel ranges which they turn out and which are to be found in many parts of Canada. For logging camps there is nothing better in the way of steel ranges to be had, than the "Enterprise Camper," turned out

Plant of The Enterprise Foundry Co., Sackville, N. B.

by this company. In fact, it is exactly designed to meet every requirement in this class of work. The "Enterprise Camper" combines large capacity, generous dimensions, durability and perfect operation with compact construction. It burns both wood and coal, taking a stick of wood 32 inches long. It has an extra large oven which is fitted with a strong, well-braced door, opening level with the oven bottom. It will handle the cooking operations for 60 to 100 men. This range is made of the highest quality bessemer steel and fitted with

Canada Metal Company's Monster Melting Pot

SUPPLIES

Everything in the Grocery line that's needed for the Camps—we are ever on the look out for goods that will meet your requirements and now have on hand a number of splendid lines which you can without doubt use to good advantage in these times of rapidly advancing prices for all food products. WHOLESALE GROCERS

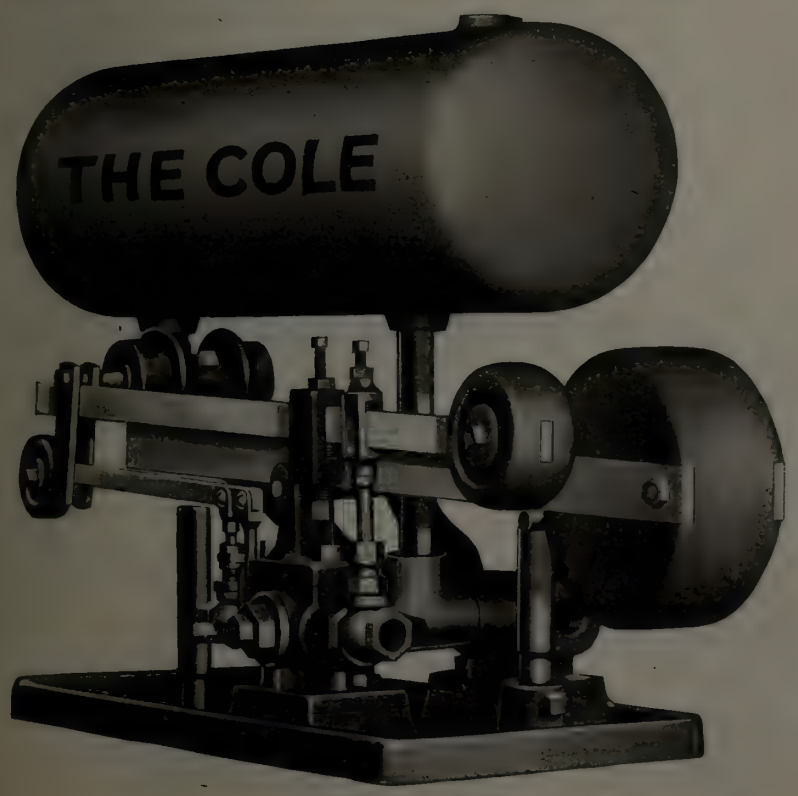
Church St. and Esplanade, TORONTO

Increased Circulation

and a Hotter Kiln



A Cole Steam Trap on your steam line will give greatly increased circulation, a hotter kiln and effect a big saving in fuel.

The Cole takes care of all condensation and returns it to your boiler as feed water at a high temperature. **Hotter than is possible by a pump.**

Send us particulars of your steam plant and let us show you the saving a Cole Steam Trap can work in your plant.

Geo. W. Cole Co.

838 Dundas St. - Toronto

The "Cole" for Coal Economy

exceptionally heavy castings: The "Enterprise Camper" is turned out in two important sizes. No. 924 measures, with reservoir and shelf, 61 in. x 33 in. on the top. Its oven is 24 in. wide, 25 in. deep and 15 in. high. No. 1030 has a top measurement with reservoir and without shelf of 62 in. x 33 in. Its oven is 30 in. wide 25 in. deep and 15 in. high. In connection with these ranges the company can also supply a detachable copper reservoir and large water front if required. The company will be pleased to send illustrated circular and prices to anyone making enquiry.

Cole Tilting Steam Traps

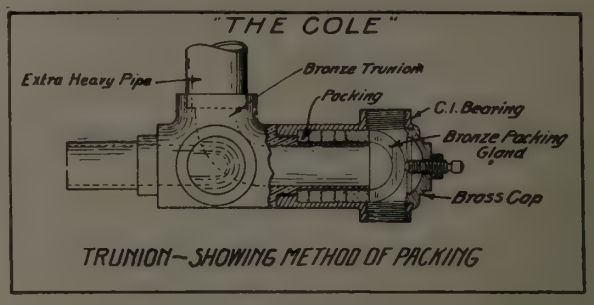
One of the accompanying illustrations represents a battery of "Cole" Tilting Steam Traps receiving condensation from dry kilns and heating systems. These traps are automatically equalizing the different pressures and returning the condensation to a return trap above the boiler, whence it is returned into the boiler much hotter than it could be accommodated by a pump.

In most woodworking plants fuel is not an article of much expense, but it costs money to handle wood fuel, and there is therefore

A Battery of Cole Tilting Traps

good reason for avoiding handling two or three times the amount required. The principal saving in woodworking plants which is claimed by the use of the Cole Tilting Steam Traps, is in removing air from the coils with the water, which, it is claimed, cannot be done without a tilting steam trap or vacuum pump. A vacuum pump is of use, it is held, only when carrying very low pressure. In woodworking plants the chief essential is heat, and the only way to make more heat is to carry higher pressure. This can be accomplished by the use of a Cole trap, which at the same time removes all air and water and holds the steam in the coils, increasing the heating capacity and creating perfect circulation, also permitting the spray pipe in the kiln to be opened without breaking the vacuum.

The makers of the "Cole" steam trap claim that it removes the air better than float or expansion traps, because, when the trap is discharging into the boiler the system stops circulating. As soon as this is accomplished the steam, air and water separate. The water, which is heaviest, falls to the bottom; the air, which is heavier than steam, settles on top of the water. As soon as the trap returns to its filling position again the water rushes into the empty chamber. The air follows the water and escapes through an automatic air relief valve on the trip. Steam reaches the outside of the heating coils and does its work. On the other hand, if the steam is allowed to go through a continuous float trap or extra trap, or to drip out through



TRUNION—SHOWING METHOD OF PACKING

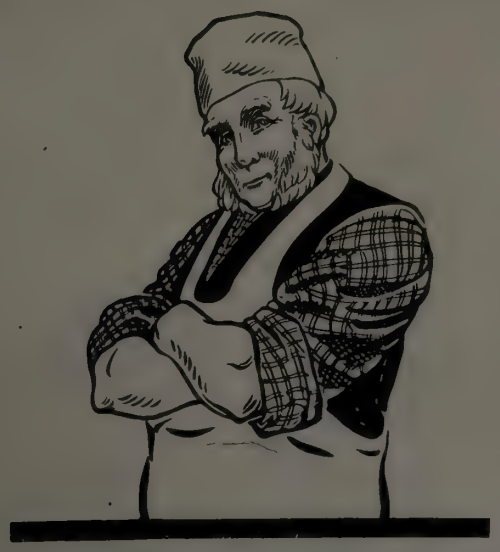
the valve, it may escape with the water and the air stay in the pipes. It is a well-known fact that results cannot be obtained with air in the steam pipe.

An important feature in connection with "Cole" steam traps is the system of packing as illustrated herewith. Our readers should note the offset in the bronze trunion where the packing makes a joint, as well as the ordinary friction joint. The packing is allowed to expand without causing friction.

Moose Head Brand Products

Lumbermen in all parts of Canada are familiar with the "Moose Head Brand" shoepacks, larrigans, moccasins and sporting boots, manufactured by John Palmer Company, Limited, of Fredericton, N. B. This company was established in 1877 and is under the able management of Mr. Chas. K. Palmer, president and general manager, who has been connected with the company for over 25 years. Associated with Mr. Palmer is Mr. Wm. M. Todd, secretary-treasurer, who has been with the concern ever since he was a boy. In 1912 a new and thoroughly modern factory and tannery were erected, which consists of three floors, 226 ft. by 50 ft. Every part of this building is now occupied by the 135 employees of the firm. In the tannery, over 200 sides of waterproof, oil-tanned leather are turned out daily, and are made from heavy packers' steer hides, under the company's own particular process, the product when completed being known as "Skowhegan" leather. From this leather the "Moose Head Brand" moccasins and larrigans are produced, all being hand sewn and made on new roomy lasts, so as to allow the foot to be fitted with ease. Everything in oil-tanned waterproof summer and winter footwear is manufactured by this company and its lines are to be found not only throughout North America, but in many other lands as well.

John Palmer Company's Plant, Fredericton, N. B.



Napoleon Said :

"An Army Marches on Its Stomach."

This is just as true of men in your lumber camp as of an army. Men doing strenuous work of any kind should have wholesome food made of

Cream of the West Flour

the hard wheat flour that is guaranteed for bread

All the strength and nourishment of the wheat kernel is retained, making the flour very nutritious.

It is being used now by many lumbermen throughout Canada.

We want YOU to try it.

Excellent Facilities for Handling Orders

One of the requirements that every lumberman expects when he places an order with a wholesale firm is to have it properly filled and handled with greatest rapidity. In order to give this desirable service the firm must have the necessary space, the proper facilities and an up-to-date system. A Toronto house that possesses all these features and is, therefore, able to give their patrons a most satisfactory service is H. P. Eckardt & Company, whose fine warehouse is located at the corner of Church Street and Esplanade.

A journey through their fine building impresses one with the fact that a close study has been made of the question of service. The warehouse, from top to bottom, is arranged with one end in view, and that is the handling of orders with despatch and thoroughness. A big array of lavor-saving devices are in evidence. There is a large freight elevator with a capacity of two tons, a smaller one for light goods and passengers, while another labor saver is the lowerator, running from the top floor, which works automatically, carrying goods down to the shipping department on the first floor by gravitation. Here orders are assembled and loaded on the waiting drays in the covered driveway. This latter is a feature that will appeal to dealers as it allows goods to be loaded in the worst of weather without damage, while tarpaulin protects them when being delivered.

Each floor has a space of approximately 13,000 square feet, so that there is plenty of storage for a large stock. On the top floor are located the tea packing and coffee departments, where their Ludella Tea is packed and Monarch Coffee is roasted and packed. This plant is equipped with the very latest and most approved machinery which it is possible to procure. Tea and coffee are strong Eckardt attractions. There is also a labelling department on this floor where they label their Monarch brand canned fruits, vegetables and salmon. On the third floor is located the broken package room, where small orders are assembled and packed. The basement is used almost entirely for the storage of dried fruits, and here is located the fruit cleaning department, which is one of the strong features of their dried fruit business.

The offices and sample rooms are located on the first floor and are spacious, bright and airy, finished in oak and marble that pleases the eye and presents a most business-like appearance. To the right as you enter is the personal office of Mr. H. P. Eckardt, the general manager, in a position where he can keep an eye on the workings of the business, easily be located—and direct the co-operative spirit which is manifested in Eckardts. The story of this spirit is simple enough, Mr. Eckardt is ready at all times to go over in detail any and every important question that may come up with the buyers, salesmen and managers of the business.

The Monarch line which is put out by the Eckardt people is admitted to be a top notcher, in a distinctive class; and is a main attraction of this progressive and aggressive house.

EDGINGS

Ontario

The Thessalon Lumber Company, Nesterville, Ont., commenced operations for the present season on May 4th.

Lewis Fick & Son, Simcoe, Ont., recently lost their planing mill by fire. The building and machinery were destroyed.

The Canadian Hardwoods, Limited, Deseronto, Ont., have changed the style of their name to the Dominion Hardwoods, Limited.

M. L. Stearns Limited, L'Orignal, Ont., commenced operations at their sawmill on May 1st, giving employment to about 100 men. The company have a large supply of logs on hand.

The Pigeon River Lumber Company's plant at Port Arthur, Ont., resumed operations on May 1st, giving employment to about 250 men. The company report that they expect a busy season.

The Abitibi Power and Paper Company are laying out a small town near the site of their plant at Iroquois Falls, Ont. The scheme provides for a number of dwellings, each on its own lot, with provision for sewers, paving, etc.

The Cobourn Lumber Company, Limited, Lucknow, Ont., has been incorporated with capital stock of $40,000, to carry on business as saw millers and dealers in lumber, etc. The chief party interested is Moorehouse Mitchell.

The Hope Lumber Company's mill at Thessalon, Ont., commenced operations for the season during the last week of April, with a full crew of employees. The company have installed a soda tank for dipping their lumber as it is transferred.

The Dale Planing Mill at Fort William, Ont., was recently damaged by fire. The building had not been used as a planing mill for some time, but was occupied by the Pigeon River Lumber Company. It is estimated that the damage will amount to between $2,500 and $5,000 on the building and machinery.

Hodgson Bros.' Chemical Company, Limited, Lindsay, Ont., have been incorporated. They report that they are now erecting their factory and expect to have it running by the first of July. The plant will be equipped for the manufacture of charcoal, wood alcohol and acetate of lime, having a capacity of 20 cords per day.

The Charlton Saw Mill Company's plant at Collingwood, Ont., was totally destroyed by fire recently. The mill was constructed in 1872 by Messrs. Kanady, McDougall & Company. Shortly afterwards the name of the firm was changed to Christie Kerr and Company, Mr. Kanady still being largely interested. Subsequently it became the Toronto Lumber Company, the chief parties interested being Messrs. Christie Kerr and Jas. Playfair, Sr. The plant was next operated by S. C. Kanady for a few years, after which it stood idle for some time and was purchased subsequently by Robert Emerson. A few years later it was sold to Messrs. J. & T. Charlton, who in turn were succeeded by the Charlton Saw Mill Company.

Eastern Canada

The Carter Saw Mill at Welsford, N. B., was badly damaged by fire recently. There was no insurance.

The York & Sunbury Milling Company, Gibson, N. B., commenced operations for the season on May 1st.

J. Therrien, lumberman, Montreal, P. Q., recently lost part of his stock by fire. The loss was covered by insurance.

Lemieux, Fils & Cie, lumbermen, Auckland, P. Q., have been registered. Those interested are J. Lemieux, T. S. Lemieux, J. Breault and D. Mongeau.

The Provincial Lime Company, Limited, has been incorporated with head office at Brockville, N. B., and capital stock of $10,000, to carry on the business, among other things, of manufacturers of lumber, etc.

The mill owned by the Little Bonaventure Lumber Company at Little Bonaventure, P. Q., has been purchased by R. N. LeBlanc. The plant is ready for operation and will turn out long lumber and shingles.

Omer Bergeron, St. Clothilde, P. Q., is about to start work on the erection of a sawmill to take the place of the one which was recently destroyed by fire. The building will be of frame construction and tin roofing and is to cost $5,000.

The Riordon Pulp & Paper Company, Montreal, P. Q., report that they expect to start sawing lumber at their mill at Calumet, about May 15th, and that they are assured a sufficient supply of labor. Driving conditions have been good this spring.

A part of the lumber yard of Mr. Julien Therrien, Papineau Avenue and DeMontigny Streets, Montreal, has been destroyed by fire. The fire, which started in one of the sheds, burned a large number of doors and sash, and also damaged some lumber.

Albert Caron, St. Adalbert, P. Q. (Co. L'Islet), has awarded a contract for the erection of a sawmill. The general contractor is Achille Dechene. The building will be of frame and brick construction with concrete foundation and work will be commenced in June.

Alexander Watson Limited, has been incorporated with head office at St. John, N. B., and capital stock of $24,000, to carry on business as general timber and lumber merchants and to deal in lumber, timber, logs, etc.. Those interested are A. Watson, I. F. Archibald, F. R. Taylor and O. Ring, all of St. John, N. B.

A complete sprinkling system for fire protection is being installed at Victoria mill by Fraser Limited, Fredericton, N. B. An 8-in. main and two hydrants are being placed near the mill, which will be available when the city water mains are extended to that district. Water will be pumped from the river through the mill.

The Wayagamack Pulp and Paper Company, Limited, Three Rivers, P. Q., are putting up a one-storey brick extension to their furnace room, 150 x 125 feet. The general contractors are Nobert and Dugre, St. Georges Street, Three

Rivers, and the engineers are T. Pringle and Son, 20 St. Nicholas Street, Montreal. The extension is to cost $11,000.

The St. Maurice Paper Company, 524 Board of Trade Building, Montreal, have commenced excavation work in connection with their pulp and paper mills at Cap Madeline, P. Q. The general contractors for the plant are Geo. A. Fuller and Company, Limited, Read Building, Montreal, and the engineer is E. G. Barratt, Woolworth Building, New York.

Miller Extracts Limited, have been incorporated with head office at Montreal, P. Q., and capital stock of $200,000 to carry on business as lumbermen and manufacturers of and dealers in lumber, timber, wood, pulpwood, paper, etc. Those interested are G. W. MacDougall, L. Macfarlane, Wm. B. Scott, A. K. Hugessen and J. G. Cartwright, all of Montreal.

At the annual meeting of the firm of Price Bros. & Company, Limited, Quebec, P. Q., it was reported that the net profits of the company during the past year amounted to about $393,000, and that the bank indebtedness was reduced by more than $600,000. These results were made possible by the high prices for paper and sulphite. The company reports that the outlook for the future is most encouraging.

Western Canada

The Hartnell Lumber Company, Hammond, B. C., have erected a large shingle dry kiln.

The Ladder Lake Lumber Company, Big River, Sask., commenced operations for the season early in May.

The Silverton Lumber & Power Company's mill at Silverton, B. C., will be operating during the present season.

Mr. E. Macintosh and Mr. Rogers, of St. Elmo, B. C., have entered into a partnership and will operate the St. Elmo shingle mill.

The Morehart Broderick Lumber Company, Limited, Estuary, Sask., have been succeeded by the Imperial Elevator & Lumber Company.

The Trethewey Saw Mill near Clayburn Station, B. C., is nearly completed and is expected to be in operation towards the end of May.

The Nicola Valley Pine Lumber Company are operating their plant on two ten-hour shifts this season and are turning out about 130,000 feet per day.

The Finger Lumber Company, The Pas, Man., have purchased 93 square miles of spruce timber limits on the Carrot River from the Prince Rupert Lumber Company.

The Prince Albert Lumber Company, Prince Albert, Sask., commenced operations for the present season on May 2nd, with a force of 150 men, which was increased to 500 shortly afterwards.

The Vancouver Island Marine Limited, has been incorporated with head office at Victoria, B. C., and capital stock of $250,000, to carry on business as lumber merchants, and dealers in timber, lumber, etc.

A despatch from Golden, B. C., states that negotiations are under way for the disposal of the Palliser Lumber Company's mill at Palliser, and its removal to Golden in connection with the A. J. Maguire project.

The Far West Investment Company, Limited, has been incorporated with head office at Vancouver, B. C., and capital stock of $25,000, to carry on the business among other things of timber and lumber merchants, sawmill owners, loggers, etc.

The Direct Manufacturing Company, Limited, has been incorporated with head office Vancouver, B. C., and capital stock of $25,000, to carry on business as manufacturers of and dealers in lumber of all kinds, including wood pulp, paper, etc.

A considerable amount of lumber was destroyed by fire in the lumber shed of the McGibbon & Hodgson Lumber Company at South Vancouver, B. C., on May 2nd. Fortunately there was no damage to the main building although the shed was destroyed.

P. F. Mullen & Company, Limited, have been incorporated with head office at Vancouver, B. C., and capital stock of $10,000, to carry on business as sawmill owners, loggers, lumbermen and merchants, and manufacturers of and dealers in lumber, timber, lath, shingles, sash and doors.

The Cook & Craig Lumber Company, Limited, has been incorporated with head office at Vancouver, B. C., and capital stock of $45,000, to carry on business as manufacturers of pulp and paper, lumber, and timber products; also timber merchants, sawmill owners, loggers, lumbermen and millmen, etc.

The Macken-Knight Lumber Company has been formed at Chilliwack, B. C., by W. L. Macken and T. P. Knight. The firm have taken over the lumber yard and business of the Abbotsford Timber & Trading Company at Chilliwack and have made arrangements for handling the cuts of several neighboring mills.

Sealed tenders are being received by the Minister of Lands for British Columbia until May 31st, 1916, for the purchase of Licence X536, to cut 2,363,000 feet of fir, cedar and hemlock on an area situated on Redonda Island, west shore of Homfray Channel, New Westminster District. Two years will be allowed for the removal of the timber.

It is reported that the McLellan Lumber Company's plant at Ladner, B. C., which has been closed down for a year and a half, has been taken over by the Toronto debenture holders and that a new company will be organized, after which the mill will be operated again. The company have valuable timber limits on Jervis Inlet and on adjacent islands. The plant will give employment to between 40 and 50 men and has a daily capacity of 150,000 feet.

F. W. Avery, Ottawa, well known as one of the group of successful Ottawa lumbermen, died at the General Hospital in Montreal on May 11th after an operation. The late Mr. Avery was born in New York in 1852 and came to Canada in 1878. He was vice-president of the Canadian Lumbermen's Association in 1909.

On account of the difficulty in securing steamers, the International Paper Company, Portland, Me., will be obliged this year to use barges for shipping pulpwood from the Maritime Provinces to Portland. They have just chartered 6 large barges and will put them on the route between Chatham, N.B., and Portland, probably running them in tows of three.

Be Prepared!

A Speedy Application of Egyptian Liniment Might be the Means of Saving the Life of Your Most Valued Horse

IT'S always wise to keep a little Egyptian Liniment ready for an emergency. It is easily and quickly applied and always proves a sure cure for the many ailments of horses.

It is the only liniment on the market that **will stop bleeding at once.**

The Moreau Barking Machine Co., Ltd.,
St. Hyacinthe, Que.
Rossing Machines

Dear Sir:

Acknowledging your letter 12th inst. in which you state that you have been informed by your Mechanic that we had to quit Pulpwood Barking, et al.

Facts are that the purchasing of the few machines which we did, was for purpose of educating people up and along Lines of the necessity. After having served that good purpose, we disposed of our machines, and to-day the rossing-peeling, and barking of Pulpwood increases to larger and larger extent, and that is what is desired for the market—Pulpwood outlined, and not with the Bark on.

We are very glad to subscribe that your machines are doing very good work along Lines. We are forwarding your letter to our C. E. & S. of M., S. B. Clement, North Bay, who may be enabled to furnish you further information and assistance of interest.

Thank you for the courtesy.

Yours truly,
J. L. Englehart,
Chairman.

Investigate the Moreau Barker

The accompanying letter is only one of many we can show. They all tell the same story of time saved, money made and complete satistac-tion.

We are prepared to prove the Moreau Barker equal to any work demanded of it. It is portable.

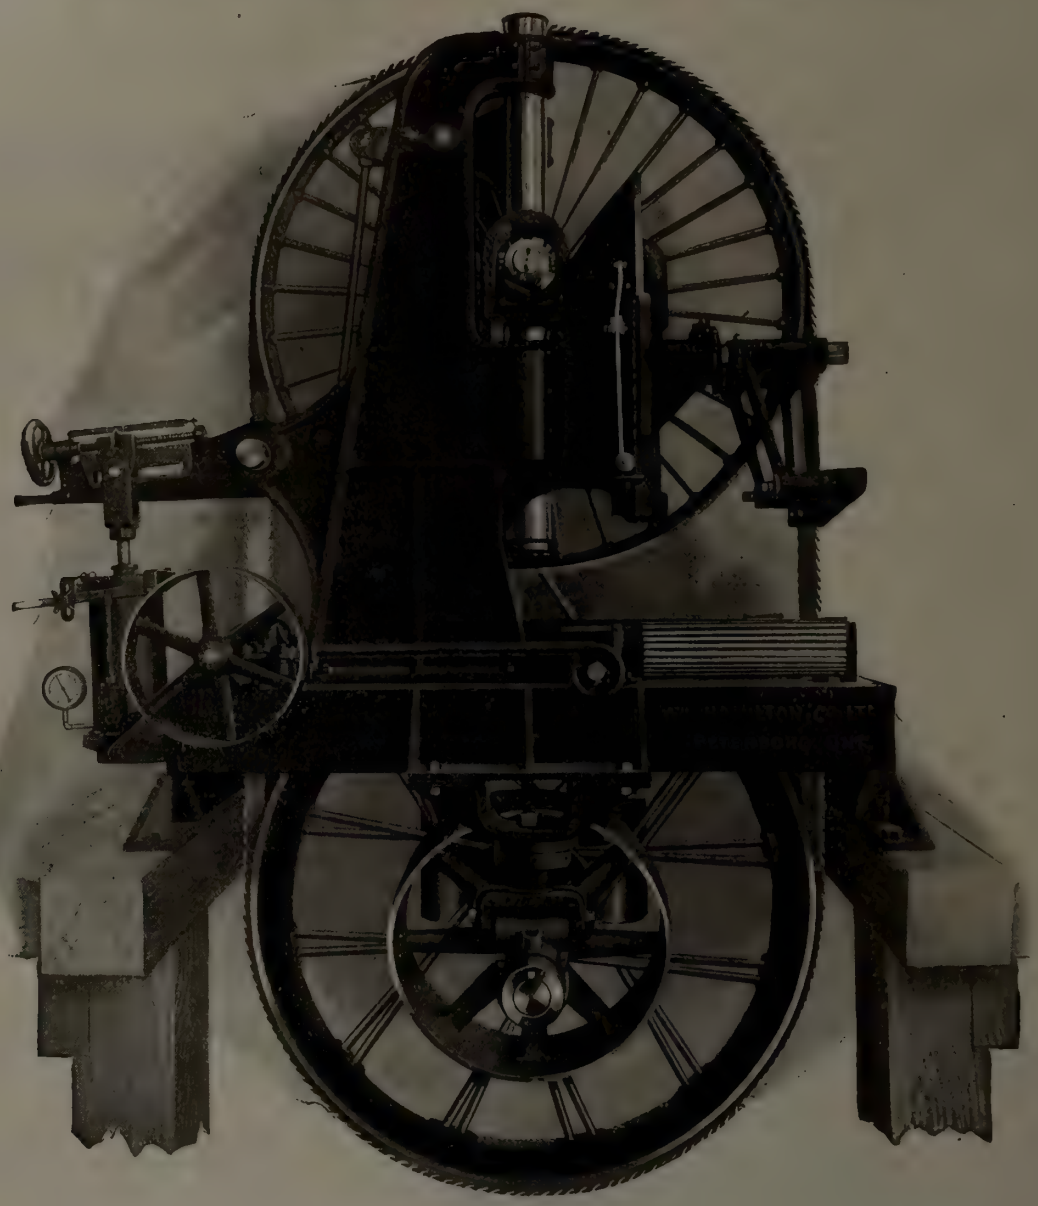
Manufacturers of Steam Engines and Woodworking Machinery

The Steam Tension Band Mill

Single and Double Cutting



Features which commend this Band Mill to favorable notice

(1) Tension on saws maintained by steam—quickest and most sensitive form of tensioning yet devised.
(2) Unbreakable saw guide raised and lowered by steam—**first used on our machine.**
(3) Great saving in saws—actual tests have proven saws have a longer life on this machine.
(4) Both top and bottom wheels instantly aligned by screw adjustment.
(5) Takes saws 12 in. to 14 in. wide.
(6) Heavy, rigid, strong and accurately built throughout.
(7) Built by expert workmen in a plant that has been manufacturing high grade sawmill machinery for sixty years.

May we send you a list of satisfied users?

A Hubbard Oven In Your Camp

A number 3 Hubbard Oven, 31 square feet of tile baking surface, occupies floor space of 5 ft. x5 ft. 6 in. Height over all, from 5 ft. 7 in. to 6 ft. 4 in. Shipping weight ***only*** 2,100 pounds. Also made in 4 other sizes.

The "Hubbard" portable baking oven equipped with "Perfect Rocker Grates" is a sanitary, economical and efficient baking device for lumber camp use. It is substantially built, compact in design and consumes a surprisingly small amount of fuel.

Accompanying is a list ot representative lumber camps using the Hubbard oven with perfect satisfaction.

Every oven is carefully assembled in every detail before being shipped. This assures the purchaser that there will not be the slightest trouble in erecting the oven at its destination. No special tools are required and every oven is shipped complete.

Write for prices f.o.b. your station.

SURROUND YOUR BUSINESS WITH NEVER-FAIL BELTING

"Strength of Gibraltar," while not our phrase, aptly applies to the rubber belting made by us and sold under the name **"Gibraltar Redspecial."**

* * *

It would be interesting to us if you as a user of belting would, before making your next purchase, get a verdict on **"Gibraltar"** from some of your friends.

* * *

Ask them if a stronger belt than **"Gibraltar"**—one giving more service with less loss of power—can be obtained anywhere; if any other product will survive heavy loads better; and, if, in withstanding the jerky strain consequent on fluctuation of power, any other belt can show a higher quality of friction in uniting the plies than **"Gibraltar Redspecial."**

* * *

We have evidence aplenty, in the form of voluntary testimony, which shows that for strength, durability and general service, **"Gibraltar Redspecial"** is unmatchable. In the Biggest Saw Mills, Biggest Manufacturing Plants, one "driving force" is nearly always in evidence—Dunlop **"Gibraltar"** Belting.

* * *

For Drives, Rotaries, Edgers, Lath and Shingle Machines, or any kind of Transmission work, there is nothing better than Dunlop **"Gibraltar Redspecial"** Belting.

* * *

We feel sure that if you were to try **"Gibraltar"** Belting your testimony, also, would be most complimentary to our product.

NO LOAD TOO HEAVY

DUNLOP "GIBRALTAR" BELTING

NO SERVICE TOO EXACTING

D. 26

Dunlop Tire & Rubber Goods Co., Limited

SEAL OF QUALITY SEAL OF QUALITY

DUNLOP
RUBBER HOSE

1894-1916 **Truly-Canadian**

Exclusive Endorsation by Highest Authorities

There is scarcely a manufacturer in Canada who has not heard of the masterly qualities of Dunlop Mill Fire Hose. This very stability is what secured for the Dunlop Line the exclusive approval for Canada of the Underwriters' Laboratories, Inc., Chicago. The approval takes the form of authorizing Dunlop, alone, to use the Underwriters' rubber label on **Dunlop Underwriters' Mill Fire Hose** (Cotton Rubber Lined) or in other words, the Underwriters' O.K. mark.

Underwriters do not have a habit of putting their approval on secondary products. They have a passion for going straight to the brand which has leadership written all over it. You can figure out for yourself the merit **Dunlop Underwriters' Mill Fire Hose** (Cotton Rubber Lined) must have to be so highly regarded by the Chicago Underwriters.

Nation-Wide Demand for "Dunlop"

Steam Hose is a line that cannot survive very long on make-believe virtues. Hence, the reason we feel proud that Dunlop Hose has been in such nation-wide demand by critical observers of just what merits a Steam Hose must possess. Dunlop **"Gibraltar"** and Dunlop **"Long-Life"** have a pretty good monopoly of favor with Steam Hose users.

Skilled Men Await Your Commands

Dunlop **"Hercules"** and **"Peerless"** are two brands of Water Hose of exceptional durability and famous for their smooth waterway. We also manufacture hose for many other purposes. Our skilled men are ready to specialize on your order, no matter how particular you are. We welcome buyers who are hard to satisfy, because we know full well such men will all the more appreciate the study we have given—and the apprenticeship we have served—to perfect the Dunlop product.

128,350 Laths in Ten Hours

Our Lath-Mill and Bolter have made a test cut in ten hours of 128,350 four foot Laths, 1½ in. by ⅜ in., counted, tied and piled, as will be seen in the following letter:—

Five-Saw Lath Mill

Messrs. P. Payette & Co.,
Penetanguishene, Ont., Can.

Dear Sirs. — I thought I would drop you a line and let you know of the record Lath-Cut we made on your machines on June 29th, 1910.

We made 128,350 four-foot laths, 1½ in. x ⅜ in., counted, tied and piled, in ten hours steady cutting from mill-run, and from slabs and edgings we had saved out, in order to keep the machines cutting their full capacity.

We used your No. 1 Four-Saw Bolter, and your No. 2 Five-Saw Lath-Mill, and had two Lath-Shovers and two Lath-Tiers, in order to keep up this speed.

This shows extremely well for your Lath Machines, not only for the tremendous cut, but they ran the full ten hours without a bearing getting hot or any stoppage whatsoever, and making first-class laths.

I therefore take great pleasure in recommending P. PAYETTE'S LATH - MACHINERY, to any person requiring up-to-date machinery.

I remain,
Yours sincerely,

D. J. MacMILLAN

your vacation

Get away to happiness—away to the nerve-resting, pine-scented, sleep-giving air of the Muskokas.

You must rest from the brain fag of business, Mr. Lumberman—you must have a change of air,—and the children must come off the hot, dusty city streets. Where better to go than to the sweet, pine-laden air of Lake Rosseau.

Cut out business for a while—get away up into this glorious north country, and have a look at the world as it was when young. Lakes Joseph, Rosseau and Muskoka, with their hundreds of pine-clad isles, have been preserved in all their primeval grandeur. The hand of man has changed Muskoka very little, except to dot the region with plenty of comfortable hotels, where comfort and moderate charges are the watch words. Golfing, fishing, canoeing, sailing, motorboating, tennis—you can have your favorite game and play it better in the bracing pine-laden air of these famous lakes.

Wonderful Air, Wonderful Scenery

Being over 1,000 feet above sea level, the cool, clear air of Muskoka is laden wih the curative odors of pine and balsam, and is wonderfully exhilarating. The beautiful vista of islands folding back in seemingly endless profusion, amidst sparkling lakes, is a sight never forgotten. Malaria, Mosquitos, Hay Fever Unknown.

Royal Muskoka Hotel

Canada's finest summer hotel, in the heart of the marvelous Muskoka Lakes. Every holiday recreation offered—on the golf links, in the ball-room, on the bathing beach, on the water, in the woods or on cool shady verandahs—to say nothing of the splendid cuisine and comfortable bed-rooms (all outside rooms).

Write to-day for hotel list and general literature to **Muskoka Navigation Co., The MacLean Building, Toronto.**

Turn Waste Into Profit

with a

Jones Underfeed Stoker

Let the Jones Underfeed Stoker take care of the problem of waste in your mill. They are installed in Dutch Ovens under your boilers in such a way as to utilize all refuse in conjunction with a small proportion of coal for the production of steam.

You not only save in disposing of your waste but actually turn it into money by a saving in your fuel.

18 JONES UNDERFEED STOKERS AT
ST. LAWRENCE PULP & LUMBER CORPORATION,
CHANDLER, QUEBEC.

Six 500-horsepower Edge Moor water tube boilers were Jones Stoker equipped in 1914. The view above shows the fronts of the special Dutch ovens which are arranged for burning their mill refuse. The chutes which deliver the waste to the opening in the tops of the oven are above the floor and do not appear in this picture. The refuse makes up a substantial part of the fuel used. This same type of furnace has been installed by us in a large number of paper mills and other plants having a combustible waste product.

This saving is by no means a small item. We have records of many Jones Underfeed Stokers making a saving of from 50% to 75% and even as high as 99% of fuel costs. We shall be glad to send you the details.

Big Savings In Fuel

The working system of Jones Underfeed Stokers is extremely simple. They are substantially built throughout and above all ***sure in operation.***

The installation of these Stokers does not preclude the use of coal as a regular fuel, if this is desired, at any time. In fact by investigating, you will find the same equipment will burn coal alone more efficiently than coal can be burned by any other system of firing.

We have a lot of interesting matter to put before you regarding this system and only want a line from you to acquaint you with the proposition.

May we have that line?

Jones Underfeed Stoker Co., Limited

National Trust Building, TORONTO

A union pipe coupling which is at all times an efficient union.

THE DART UNION

will not leak, does not have to be watched, costs nothing to use again, has no replacement or upkeep expense and will give you service enough to save you treble what it costs you.

Have Dart Unions Been Used in Your Plant?

If not say so and let us send some for you to try out or if you prefer to buy just order from your jobber.

Yates
-formerly BERLIN

No. 91 Matchers Give You the Best From Every Board at the Fastest Speed Your Men Can Work.

Can You Ask More of A Planer and Matcher?

In one Southern Mill two Yates No 91's replaced nine machines of various makes, decreased manufacturing costs 30% the first year and improved grades 35 to 40%.

Let us show you that it will do as much for you. Our Book A 91 will help you. Write for it to-day.

UNTIL a new race of human beings is developed, it probably will not be necessary to increase the speed capabilities of this matcher, for equipped with an Automatic Feeding Table the "91" now takes care of stock faster than the most expert operator can properly judge it and get it to the machine.

Since developing the modern matcher to the point where any increase in speed is limited by the ability of the operator to properly feed it, we have not directed our activities toward impracticable bursts of speed but rather toward improving quality, increasing the actual productive time of machine and operator and decreasing its upkeep expense.

By making every adjustable part accessible to the last degree we have reduced materially the time consumed in making changes and adjustments, while improvements in other directions have resulted in lowering upkeep costs to a point that is practically negligible.

The Yates No. 91 offers you everything you could ask of a matcher—Speed, the Highest Quality of Output, Maximum Convenience, Accessibility of Parts, Safety, Strength, and the lowest Upkeep Expense.

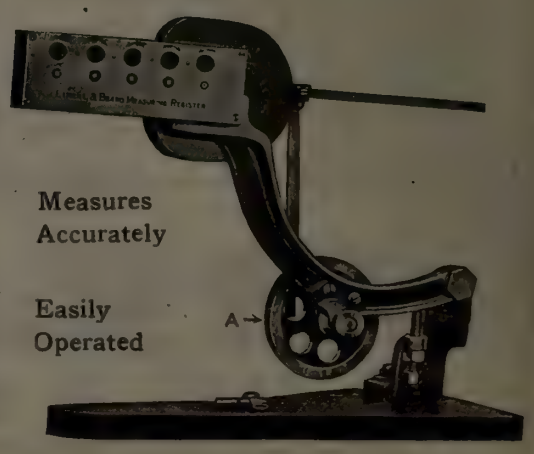
General Mill Supplies MONTREAL

The Morrison Lumber Measuring Register

May be bolted to your planer, molder, etc., easily and quickly. It will automatically and continuously measure your stock, giving the results in lineal or board measure as desired.

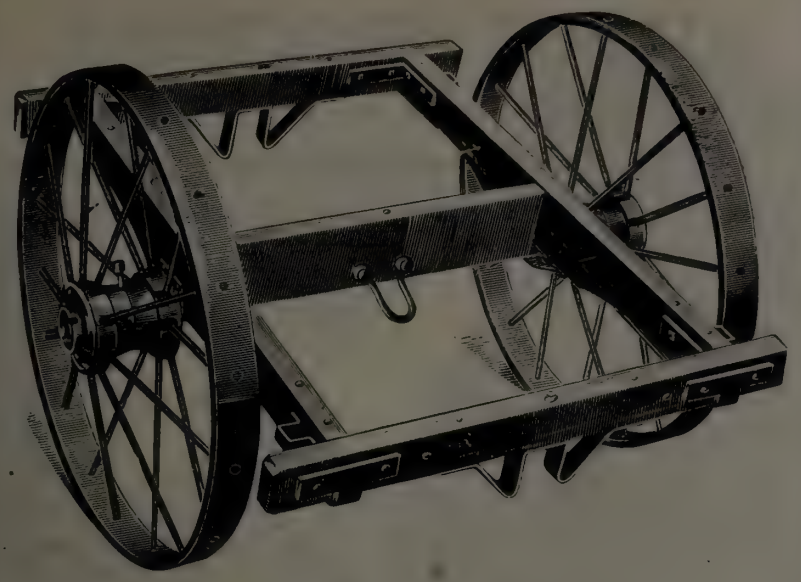
Solidly constructed; no parts to get out of order; fully guaranteed to give accurate results if operated according to instructions.

A labor saver that saves you money. Write for explanatory booklet.



The James Morrison Brass Mfg. Co., Limited

93-97 Adelaide St. W., TORONTO



The Truck That Saves Its Cost Several Times Over in The Year

This truck is designed for lumber yards and planing mills and will be found invaluable for loading and unloading cars.
The front gearing is detachable and may be used with eight or twelve hind gearings. It is a double-header, nuts on axles being kept tight with Steel Cotter Keys.
Oil cups on the wheels and the fact that there is no resetting of tires saves any amount of trouble.
The old wooden-wheeled truck is a back number in comparison with this. It will pay you to write for our general catalogue which describes these trucks in detail, and pick out the style you want now.

Tudhope-Anderson Co., Limited
ORILLIA, ONT.

NO SPOILED TEA

If you use the sealed packets of

"SALADA"

TEA

Always fresh and flavoury and yields splendidly in the cup. Far more economical than dusty, dried-up bulk tea, and it always has that famous flavour. We supply many large lumber firms.
Let us quote you.

SALADA TEA CO.
TORONTO and MONTREAL

Let's Face the Facts

Every time you tie a bundle of laths with yarn you lose.
Every time you tie a bundle of laths with Laidlaw wire you win. It's good for everybody right down the line. The mill man likes it because it saves him money. The dealer likes it because he receives his laths in good condition. The contractor likes it because a solid, well tied bundle is easier to handle and there are no broken bundles to invite theft.

DO IT THE LAIDLAW WAY, whether it's bundling wire for flooring, lath or box shooks, wire bale ties for baling pulp, wire for car stakes. Lowest prices.

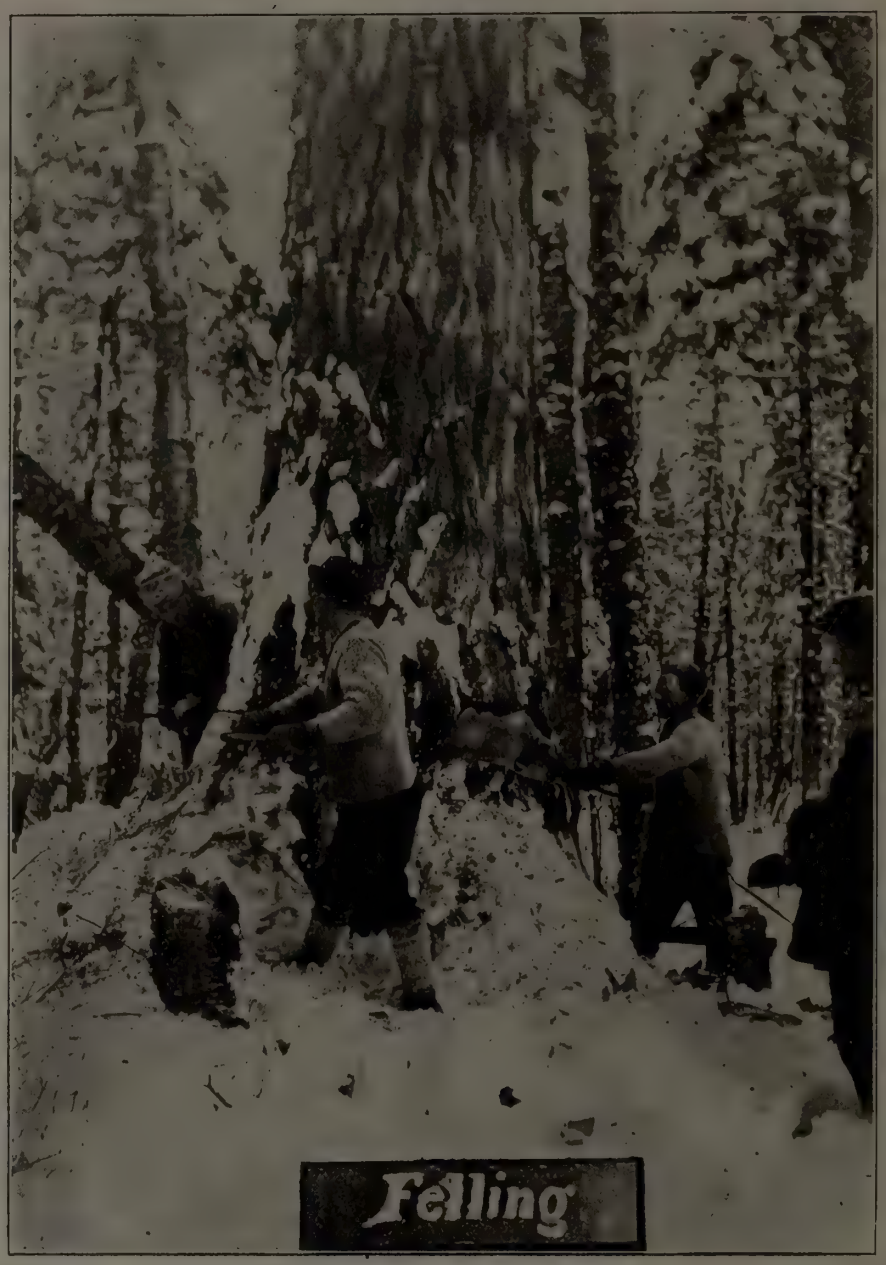
ONTARIO
Canada's Banner Province

Ontario's timber resources are unrivalled.

No other country possesses such a variety of hard and soft woods.

Ontario forests are adjacent to the greatest waterways of the world—the mighty rivers and lakes provide unusual facilities for the lumberman.

Three Transcontinental Railways across the Province eliminate transportation difficulties.



Ontario's wood working industries, using 34 different kinds of wood, provide a ready market for the lumberman. Eighty-two per cent. of wood used in the Ontario industries purchased within the Province.

Ontario leads in production of hardwoods, cutting twice as much as Quebec, second on the list.

Ontario has unlimited quantities of Spruce and other soft woods suitable for the pulp and paper industry.

Tremendous pulp areas are yet untouched.

Ontario's pine producing areas outclass those of any other country in the world, both in extent and quality of the timber.

Exporters to the European markets should investigate the opportunities Ontario offers for the supply of Dimension Timber, Pit Props, Poles, Shook Boxes, Etc.

For maps of the Province and timber regulations apply to

Honorable G. H. Ferguson,
Minister of Lands, Forests and Mines,
Parliament Buildings, TORONTO, CANADA

A Typical LEVIATHAN Main Drive, Installed at the Plant of The Riviere du Loup Pulp Co., 24 in. x 6 ply, 81 Feet in Length.

Installed June, 1911, Perfect Condition Today

Base your Judgment on Service Rendered and LEVIATHAN & ANACONDA are your logical choice

During the thirty-five years that we have been making belts, we have never deviated from our original policy of producing the very best belts: belts that transmit every ounce of energy produced by the engine, that are strong, durable, pliable. With the minimum stretch and that cost the least for up-keep; in other words, belts that give the most efficient service at the lowest possible cost.

LEVIATHAN ELEVATING TRANSMITTING CONVEYING BELTING

And Leviathan and Anaconda are not affected by extreme atmospheric changes, and will give excellent service under the most severe conditions

LEVIATHAN ELEVATING TRANSMITTING CONVEYING BELTING

Let them prove their merits in your mill to your own satisfaction

Here's what we do for you!!

Our Traffic Engineers know from actual experience the Hauling Problems of every business. This knowledge is worth money to you—if you will use it. We maintain a staff of trained Traffic Engineers who will tackle your problems of Haulage and Delivery in a business-like way, and give you a report that will present in facts and figures the most economical method that you can adopt to get the most efficiency in the delivery end of your business.

NATIONAL Motor Trucks are made in four models — 1500 pounds, 2000 pounds, 4000 and 7000 pounds. Capacities that provide a truck for every line of business.

If you are as thorough in your investigation of the different makes of Trucks as we are in the construction of the NATIONAL you will own a NATIONAL Truck.

Conferring with us entails no obligation. Catalogue mailed upon request.

Will saw slabs or half logs 18" thick 24' long at a feed of 200' per min. **AND MAKE GOOD LUMBER.**

The two standard sizes have wheels 66" and 84" dia. and are made with either single or double table.

Write us for complete descriptive Catalog.

CLARK BROS. CO. - Olean, N.Y.

LOGGING LOCOMOTIVES

The designs of our Logging locomotives are the result of wide experience, extending over a period of 80 years.

The material used in their construction is thoroughly tested and is the best of its kind.

All details are accurately finished to standard gauges and are absolutely interchangeable on all locomotives of the same class and size.

This cuts out long delays at critical times of the work, as parts liable to wear can be kept on hand or shipped promptly from our works.

EXPERIENCE : RESOURCES : PRECISION

Lacey Files of International Timber Records at Your Service

The offices of James D. Lacey & Company contain a scientifically ordered body of international timberland information, records and reports which would be a revelation to you if you have never inspected them. Having taken 36 years in the gathering, it is by far the largest and most accessible resource of its kind in existence.

Naturally, as nearly everyone who contemplates the purchase or sale of timberlands turns to us sooner or later, our fund of information is being augmented from day to day.

The full benefits of this resource may be shared by you if you contemplate anything which has to do with the surest, safest and most profitable investment of today—timberlands, well purchased.

Send for our booklet, "Pointers."

THE E. LONG MANUFACTURING Co. LIMITED
SAW MILL MACHINERY
ORILLIA, CANADA

No. 2 Lath Machine

WE have brought out our No. 2 Lath Machine with the view of meeting that ever increasing demand of mill men in Canada for a light, medium capacity Lath Machine, that will turn out a first quality product.

Made with a one piece frame just as our larger No. 3 Machine. All the parts are strongly constructed and have that easy accessibility that we have made a feature of all E. Long Company Machines. We believe this very feature has done a great deal to make the machines so popular with the trade.

Just as with our larger machine, the saws are adjustable for ordinary lath or for pickets, staves, etc. In fact this machine will turn out work an exact counterpart of the No. 3 Lath Machine, except in quantity. We shall be glad to give you further details and prices.

PERFECT SATISFACTION

Waterous Sawmill Machinery is a guarantee of efficient service in every department of your mill. You will be pleased with the work it turns out, the man who operates it will like the way it works. That's why more than 80% of Canadian sawmills are using

WATEROUS EQUIPMENT

Whether you operate a portable outfit or a 150,000 ft. capacity mill, Waterous Sawmill Equipment will satisfy your every requirement. All the **time-saving** and **muscle-saving** improvements that modern sawmilling demands are embodied in our machines. At the same time even our very lightest outfits are built with a sturdiness and wear resisting thoroughness that has become proverbial.

An exact knowledge of Canadian sawmill practice, 70 years' experience and exceptionally fine manufacturing facilities as regards equipment and trained men, are combined to turn out—

The Best Sawmill Machinery for Canadian Use

We build every machine from the haul up to the sorting table, and the power plant to drive it with. No matter what you are cutting we can give you an outfit that will produce results with the best possible economy of time and labor. Send for our catalogues.

FOR SALE: Machinery and Timber

The undersigned offer for sale, in large or small blocks all their remaining timber lands, mills and town property situated in the town of Parry Sound, Ont.

We have sold quite a number of timber parcels but still have some good bargains left in Townships of McDougall, Foley, McKellar, Monteith, Carling, Christie, Shawanaga, Burpee, McConkey, Mills, Allen, Secord, Falconbridge and Street.

Special bargains in the townships of Burpee, Falconbridge and Street for small mills.

We have the following Sawmill Machinery for sale:

1 8 ft. Double-cutting Telescope Band Mill, made by Waterous Engine Works.

1 3-block right hand steam feed carriage fitted with steam set works, made by Wm. Hamilton, Peterboro, with 10-in. steam feed cylinder.

1 Double cylinder steam nigger, right hand.

1 Log Loader for right hand mill.

1 8 ft. Double-cutting Telescope Band Mill, made by Waterous Engine Works.

1 10 in. Double-cylinder steam feed carriage, left hand, for cutting 24-ft. logs.

1 left-hand steam nigger.

1 Log-loader.

1 Endless chain jack ladder with two kickers complete for right and left hand mills.

2 Roger Gang Edgers for 8-in. cants and lumber.

1 Waterous double edger, 6 saws.

2 2-saw trimmers.

1 20-ft. Slash table.

1 16-ft. Revolving Slash Table.

1 Horizontal Slab Resaw with 5-ft. wheels, made by Diamond Iron Works.

1 70-ft. Transfer Chain for sorting lumber, with necessary levers, rolls and transfer chains to complete outfit.

1 Lath Mill with bolter.

2 Lath Trimming Saws.

FILING ROOM

1 Automatic Filing Machine for 12-in. D.C. band saws.

1 Automatic Grinding Machine for 8-in. S.C. band saws.

1 Hand Machine for cut-off saws.

1 Lap Grinder.

1 Set Band Saw Rollers and levelling blocks, with necessary swedges, a number of second-hand band, gang, edger and slash table saws.

POWER PLANT

2 Double Duplex, high pressure Water Pumps.

5 60-in. x 16-ft. Return Tubular Boilers, allowed 125 lbs. steam.

2 125 h.p. Water Wheels.

1 Upright Engine for sawdust conveyor.

1 10 h.p. Engine.

1 Mitts & Merrell Hog.

1 Wood Machine for 22-in. wood.

1 Edger for ripping dry lumber, installed.

1 Edger for ripping dry lumber, not installed.

1 30 h.p. Generator, 250 volt.

1 30 light arc generator.

There is also a large quantity of shafting, pulleys, hangers, belting, tram cars and turn-tables, particulars of which may be had on application.

All of the above open for inspection at Parry Sound.

The Parry Sound Lumber Co., Limited, 26 Ernest Ave. Toronto, Can.

LUMBER

Announcement!

Murray & Gregory, Limited, have been established at St. John, N.B., since 1866, manufacturing Lumber principally for the British, West India and Home markets.

In connection with their business there, they have a Woodworking and Glass Works and supply all wood and glass materials used in building.

With the extension of the Chaudiere Branch of the Quebec Central Railway during the past two years, into their Timber Limits in Quebec, they have built mills at St. Camille, Bellechasse Co., and Lake Frontier, Montmagny where they are now manufacturing Spruce and Pine Lumber for the British and United States markets.

In Quebec, they are manufacturing and dealing in both Peeled and Rossed Pulpwood.

To individualize their Quebec products, they have adopted as their trade mark on Lumber, Logs and Pulpwood, a Trident which will stand always for "the best."

The Head Office of the Company is at St. John, N. B.

AN UNLIMITED MARKET

A LESSON OF THE WAR

IMPERIAL Trade! Have you given this phase of the World-War consideration The recent action of Sweden regarding the Export of Wood Pulp to the United Kingdom has roused British interests to look to Canada for a greatly increased supply; the demand for Canadian Wood Pulp will increase in the same ratio to the supply and every Saw Mill in the Dominion should have a small SODA PULP PLANT to take care of its Slats, Tops, Bottoms and "Waste" Wood. Contracts for long periods of years can be obtained. For full information apply—

LET'S GET TOGETHER

Chicago Lumber & Coal Co.

Capital $6,500,000 MANUFACTURERS Established 1866
General Offices: EAST ST. LOUIS, ILLS.

OUR REPUTATION is your guarantee of satisfactory service and responsible attention.

WE UNDERSTAND the select structural specifications of the Southern Pine Association and also Associated Factory Mutual Fire Insurance Companies specifications, and can make prompt deliveries of long leaf yellow pine in accordance therewith.

SOUTHERN YELLOW PINE
LOUISIANA RED GULF CYPRESS

Strong Points of the "Superior" Lath Machine

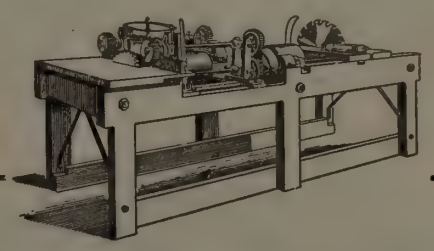
The "Superior" Lath Machine is well constructed of high-grade materials. It stays on the job saving time and money. It gives satisfactory results. 15 to 20 horse-power will run it. Capable of taking four saws. Specifications are: Wooden frame. Belt or Chain Feed. Ring-oiling Boxes. Driving Pulley 10 in. diameter, 9-in. face. Capacity with two saws 40,000 to 50,000 a day.

Some Satisfied Users

Fraser Limited, Fredericton, N.B.; Babbitt Lumber Company, St. Marys, N.B.; Turgeon & Williancourt, Amqui, Que.; Blue River Lumber Company, Cabano, Que.; Freeman & Giffin Company, Isaac's Harbor, N.S.

We also make Sappers, Cedar Cut Offs, Shingle Machines, Car Wheels, and Castings of all kinds.

Let us estimate on your requirements.



The Smith Foundry Co., Ltd.

TERMS OF SUBSCRIPTION

Canada, United States and Great Britain, $2.00 per year in advance; other foreign countries embraced in the General Postal Union, $3.00.
Single copies 15 cents.

"The Canada Lumberman and Woodworker" is published in the interest of, and reaches regularly, persons engaged in the lumber, woodworking and allied industries in every part of Canada. It aims at giving full and timely information on all subjects touching these interests, and invites free discussion by its readers.

Advertisers will receive careful attention and liberal treatment. For manufacturing and supply firms wishing to bring their goods to the attention of owners and operators of saw and planing mills, woodworking factories, pulp mills, etc., "The Canada Lumberman and Woodworker" is undoubtedly the most direct and profitable advertising medium. Special attention is directed to the "Wanted" and "For Sale" advertisements.

Authorized by the Postmaster General for Canada, for transmission as second class matter.

Entered as second class matter July 18th, 1914, at the Postoffice at Buffalo, N. Y., under the Act of Congress of March 3, 1879.

Vol. 36 Toronto, June 1, 1916 No. 11

B. C. Publicity Campaign—Manufacturers Must Co-operate

The effort which is being made by the Government of British Columbia to promote the use of B. C. lumber and timber is a development of great importance in connection with the lumber business. The fact that the Government is, in this way, recognizing the dependence of the province upon the growth of its lumber industry, shows those who are engaged in it that if they will take a similar interest in the developing of their markets they will have very valuable assistance from the Government. The work of the B. C. Government is well illustrated by the case of the Ontario market, for which they have established a commissioner's office at Toronto, whose duty is to acquaint the Ontario trade with the merits of B. C. products and to acquaint the B. C .producers with the opportunities for selling their products in Ontario. In short, the Government of B. C. is doing all it can to advertise B. C. lumber and timber to the lumber trade and to the consumer of Ontario, at the same time seeking to induce the B. C. producer to cultivate this market. A similar plan is being adopted in connection with other important markets.

Results are already being shown, that is to say, the trade in Ontario, for instance, is thinking more about B. C. products today than it ever did before, and is, we believe, in a receptive mood, ready to buy and use large quantities of B. C. products if the movement is kept up and developed fully. In order to make the most of any market, however, it will not suffice for the Government of B. C. alone to do the pioneer work and the upbuilding work as well. Unless their efforts are followed up by an aggressive policy on the part of the millmen, the Government's trouble and money will have been spent in vain. The most the Government can do is to put the two ends of the trade—the producer and the consumer—in touch with one another and educate the consumer to a full appreciation of the merits of the B. C. products. After that, the producer must do the rest. It will not do for the lumbermen simply to feel that B. C. lumber will find its way into Ontario, or into other markets, on its own merits, however great these may be. The millmen must co-operate with the Government in order to supplement its work and to carry it on until it produces results.

Every lumberman in British Columbia who has made an attempt to sell his product in an export market should know pretty definitely what efforts will be necessary to produce results out of the publicity furnished by the Government today. In the first place the millmen must give the Government all the moral support they can, and must also make a study of ways and means of giving practical support. This can be done both by advertising and by furnishing what we have recently come to understand by the term "service."

While the Government of British Columbia may be counted upon to do a good deal of the advertising work, the millman must take a hand in it as well in order to secure the best results for all concerned. Government advertising will probably reach a large proportion of those whom it is important to reach, but its effectiveness by itself will be of little account, unless it is backed up by advertising on the part of the men who produce the lumber.

The service end is something in which the millman, the wholesaler and the retailer are much more closely concerned personally. The Government's duty to a large extent comes to an end where the service business commences. In Eastern Canada, the service end has been neglected to a considerable extent in the past, so far as B. C. products are concerned, and it must be developed to a much greater degree of efficiency if the results hoped for are to be secured. What is necessary is that those who are engaged in the production of lumber in British Columbia and are interested in its consumption in Eastern Canada and elsewhere should make a study of the best ways in which the requirements of these markets can be supplied. So far as the retailer and the consumer are concerned, what they want before they will become extensive purchasers of B. C. stocks is a dependable source of prompt supply. This means extensive stocks on hand close to large consuming centres, and good transportation service between the mills and these markets, so that stocks may be kept up to the required extent. B. C. products have already demonstrated their ability, under the transportation we have had, to compete successfully with other stocks, whenever it has been possible to make satisfactorily prompt and continuous delivery. Probably the Eastern Canada situation depends more particularly upon this one point than upon anything else. The demand is already there, in a rather dormant condition, ready to show itself in good proportions if stocks become available at favorable competitive prices and in satisfactory amounts.

Unless these facts are given their full importance and acted upon, we do not see a great measure of success ahead of the campaign for increasing the use of B. C. products in the east and elsewhere, but if they are given such consideration and action as we have suggested, we are optimistic enough to see no limit to the expansion that is possible. Moreover, we see another feature of the situation, which leads to the conviction that there is no option before the B. C. millmen today, other than an unquestionably necessary campaign as indicated. The great producing sections in the Southern States have already made much headway along these very lines. They are the natural competitors of British Columbia in the great lumber and timber consuming markets. They have, in the past, taken enormous shares of this trade and today they are working along the very lines we have suggested. Great manufacturers' associations in the United States, such as the Arkansas Soft Pine Association and the Southern Pine Association are, without the assistance of their respective Governments, spending large sums of money on campaigns for promoting the use of their products.

The situation today is critical, so far as British Columbia is concerned. Its opportunity in Eastern Canada, as elsewhere, is great, but the same opportunity is knocking at the door of its most vigorous competitors, and they have already opened the door and are doing all in their power to take advantage of the opportunity. Unless the manufacturers of British Columbia adopt the same policy they will soon be so far behind in the race that recovery will be a matter of many years, if it does not become practically impossible.

Trade Ethics—Can They Be Codified?

We have heard lumbermen time and again discussing questions about trade which are supposed to come under the heading of ethics, and nothing has struck us quite so forcibly as the fact that there is, in the Canadian trade, very little unanimity of opinion as to the details of "trade ethics." Even during a frank and friendly discussion among a number of lumbermen representing manufacturers, wholesalers and retailers, it is hard to get a majority of those taking part to agree upon more than one or two main points. Perhaps the intricacies of trade are so extensive as to make the idea of introducing a code of trade ethics a theoretical one only, but why not have a good try at it, say in connection with the trade in a large distributing centre like Toronto or Montreal, by holding a series of meetings of those chiefly interested in the three branches of the trade and discussing the matter as fully as possible, then appointing a committee to see whether the ideas can be crystalized into a definite code.

As a foundation from which to work out a code of trade ethics there is nothing more practical or suggestive than the biblical instruction "Do unto others as you would that they should do unto you." That is really the working scheme of any code of trade or personal ethics and is the only basis from which a workable scheme can be developed. The way in which it works out is pretty well understood by everyone in the trade, but when it comes to putting it into practice, so many events influence a lumberman's conduct that the ideal of trade ethics often comes to grief when it comes into contact with personal interests or business friendships.

We cannot illustrate this point more effectively than by giving an example. In an address before a number of lumbermen recently Mr. F. S. Underhill, of Philadelphia, referred to the time when one of the large lumber associations of the United States was under criticism by the United States Government, and two Philadelphia newspapers suggested editorially that the association should not be fined, but its members should be sent to prison. Mr. Underhill, knowing that this was an injustice growing out of ignorance about the working of the association, called upon the editors of these two newspapers and said to each of them, something like this:—

"I live in a suburban community about six miles from Philadelphia. In that community there are two lumber yards, each carrying an investment in lumber involving from $5,000 to $10,000 capital, paying taxes to the community, giving employment to citizens of the community, and affording to the people of the community a supply of material, selected, dry, ready for immediate delivery upon any emergency. You are bound to admit that they are to this extent benefactors to the community. I have a young friend living in that community, who approached me a short time ago, stating that he wished to build a house and would like to buy a carload of lumber from me for that purpose, so as to reduce the cost of the house. I said to him: 'I am friendly to you and would like to accommodate you, but these two yards are located in this community, as you know, and are taxpayers in the community. We send our representatives to see them at least twelve times a year, asking them each time to give us business, and at very many of these visits they place orders for carloads of lumber with us. Now do you think it is a fair thing for me under those conditions to sell you goods at a price with which they cannot compete, and take from them desirable business simply because your needs enable you to buy a full carload?' And, Mr. Editor, if we had so made this sale, and one of the dealers had happened to go to the railroad siding when the car was being unloaded, and saw the material, ascertained that we had sold it to someone who would naturally have been his customer if I had not intervened, would it be criminal upon his part the next time our representative called, if he told him plainly, 'I do not care to buy any lumber from you or your house, because of this transaction,' or would it have been criminal upon his part if he had walked across the pike and stated to his competitor that he had ascertained that we had shipped to this house builder this car of lumber, entirely ignoring the local dealers? The editor did not hesitate a moment, but replied: 'I should say that was a matter of ethics,' and so, I wish to say in conclusion, that the matter of properly protecting the interest of a customer, who is a retail lumber dealer, by refusing to sell in carload lots or otherwise, to one who would logically be his customer, is a matter of ethics."

The Management End of the Lumber Business

In the Canada Lumberman of May 15th we published an article contributed by one of our readers, Mr. A. M. Johnston, under the heading "'Hire and Fire vs. Hire and Inspire." In this phrase there is summed up the whole science of business management and what is said by the writer has a definite bearing upon the conduct of any line of business. Mr. Johnston, however, is interested in the lumber business and his remarks are directed more particularly towards those who make their living in this way. Briefly, the idea set forth is a contrast of the two chief ways of getting results out of men you employ. One way is that of letting everyone know, either directly or indirectly, that they are expected to make good or get out. The other way is that of studying the men individually and learning "whom to encourage, whom to drive and whom to coax."

Take any individual manager of a business and start talking with him about this matter and there will be little or no difference of opinion, because, as a matter of theory, there is no possibility of disputing the wisdom of the latter course, but take an opportunity of looking into the actual state of affairs in a number of mills or shops and you will surely find some where the manager, though he may think that he is following the more enlightened plan, is not doing so, and is losing money by failing to get out of his men the best work they are capable of performing.

One does not like to dwell too much upon the resemblance of a man to a machine, as we all have a feeling that in our own case, anyway, there is something about us that entitles us to be considered as on a higher level than any kind of machine, however intricate or wonderful it may be. But in the treatment of an employee there is much to be learned from the way in which successful men consider his possible capacity. This capacity he will exercise fully under the right conditions and it is the task of the manager to find out what these conditions are and put them into effect. There is only one way of acquiring the necessary information about a man's capacity and that is to make a study of him just as you would make a study of your machines. A machine that is good for turning out timber would not be any good for the production of lath. Why, then, should a man who has a high capacity for producing good work under definite conditions be allowed to spend his time at something else at which his productivity is relatively small? There is only one answer to this, he should not be allowed to do it. The actual conditions prevailing in many plants show that this ideal is far from being realized.

The most useful quality in a manager, for getting results from employees, outside, of course, of a practical knowledge of the work on hand, the machinery, markets, etc., is human interest. A grain or two of this, mixed with an ordinary amount of business knowledge and experience will enable a manager to secure far better results than all the business experience in the world, when it is possessed by a manager whose ideal is to drive employees to the last minute without consideration of the special abilities of each.

Every employee is a man, like yourself, or he was, once upon a time, before he became embittered by hard experience, and even now such a man still has in him, in ninety-nine cases out of a hundred, a spark of his former self that will respond quickly to right treatment. Nothing will produce bigger or better results in any plant or office than confidence between employer and employee. The old methods of considering every man according to his resemblance, one way or another, to an average sample, is out of date. It is really the plan followed by a manager who is not competent himself to do anything but follow the line of least resistance. Many a time he actually dis-

charges better men than himself and is himself the one who should be removed. How often, even in these days, when we talk so much about efficiency, service and system, do we go into an office or a plant and become aware immediately of an atmosphere of antagonism between employer and employee? We could all mention a few cases of this sort of thing and probably there will always be some examples of it until the day of judgment, but however great may be the results secured by one or two seeming exceptions to the rule, there is no question that the same good results could be multiplied several times over if the mental atmosphere between the employer and the employee could be changed from one of antagonism or even of indifference to one of confidence and loyal co-operation.

Cleanliness Produces Profits in a Sawmill

It seems rather a superfluous remark to make about a sawmill that better results can be secured if plenty of attention is given to the matter of cleanliness, than if it is not. The fact is so certain and easily understood that it does not admit of dispute, yet, like a good many other important facts, it is often neglected. The ways in which money is lost by carelessness in regard to the upkeep of a plant and its equipment are too numerous to catalogue. A dirty sawmill is a source of great danger to everyone employed about it. Carelessness of this kind is a prolific source of accidents, and it greatly reduces the capacity of the plant and the quality of the output. After visiting a number of sawmills, one is sure to be struck by the fact that there is a great difference between the way in which they are kept up. Some of them are well looked after, while others are not, and the only reason one can give for the difference is that they are managed by different men and that the manager who does not keep his mill and equipment clean is far below the others in capacity.

The men who are employed in a mill will quickly reflect the disposition of the manager and if he does not practice methodical cleanliness, neither will they. The average sawmill employee has his mind much more definitely set upon his own individual pay envelope than upon anything else, and so long as he thinks he is being fairly paid he will not worry about cleaning things up unless an example is set by those above him. If such an example is set the workman will reflect it just as readily, and the whole plant will be more efficiently run as a result. Cleanliness and uncleanliness are quite infectious. The manager has a great responsibility in this connection for the example he sets will have its effect on the whole conduct of the business. If he insists upon the mill being kept up as neatly as possible, and the yards and tracks, etc., being carefully looked after, his example will infect not only those who work at the mill, but those whose business it is to dispose of the products of the mill in the various lumber markets. When a salesman knows that he has a well managed mill behind him he will visit his customers with a confidence that cannot be approached by a man who has not the same assistance.

We believe that this point, simple as it seems, is not given the attention that it deserves in a good many Canadian mills. We have noticed it ourselves when visiting them, and we have heard it discussed by salesmen from time to time. In our issue of May 15th, we published a forcible article regarding this subject, written by one of our contributors, and we would suggest that those who have not thought about this subject as much as they might in the past, should look up the article and read it carefully. Even during times of business activity and prosperity this is a matter which ought to receive far more attention than it does. In times like the present when economy must be the watchword in connection with every line of production, it is doubly important that a great source of loss and danger should be eliminated as far as possible. Just now, when saving operations in many Canadian mills are being resumed after a winter's idleness, the results of carelessness may be seen pretty clearly in many cases, where the mills were left just as they happened to be at closing down time last fall. How much easier it would have been to open up again this spring, if proper attention had been given to this matter. With this illustration before them, managers who have not been as careful as they should in the past ought to introduce new methods at the beginning of the present sawing season so that next fall they will have the change working well and be able to close down with a far better record of operating cost during the present season and with a much better kept-up mill, which it will be a comparatively easy matter to put into proper shape for the winter idleness and for next season's operations.

Editorial Short Lengths for Busy Readers

According to a report recently issued, it is estimated that the timber cut for 1916 in the Cranbrook forest district, B.C., will be in the neighborhood of from 150 million to 160 million feet. The last previous high record was 148 million feet.

The first contract for the construction of wooden ocean-going vessels under the provisions of the shipping bill recently passed by the B. C. Government, has been announced. The Wallace Ship Yards, North Vancouver, have secured a contract for the construction of three wooden auxiliary schooners. A start has already been made upon construction. The amount involved is about $400,000, exclusive of the cost of machinery.

A logger who sustained a broken leg and other injuries as the result of an accident at Port Mellon, B.C., last year, has been awarded damages amounting to $800 by a jury. The logger was employed as a "chaser" and alleged that the accident was caused by carelessness on the part of the man in charge of the operations. He alleged that the donkey engine was started without waiting for his signal and caused one of the logs to fall upon him.

Representatives of various eastern Canada pulp manufacturing companies have presented a complaint to the Board of Railway Commissioners at Ottawa against the proposed increase in freight rates on wood pulp from points in Canada to points in the United States. They claim that the increase will range from 3 to 40 per cent. as compared with the rates that were in force before the Interstate Commerce Commission permitted a general increase of 5 per cent. in March, 1915. After hearing the argument, the Board reserved judgment and requested a statement from the railways showing details of the proposed increases. Those interested will be allowed to send in further information in the meantime.

Recent advices from the south indicate a curtailment in production of yellow pine, of from 16 2/3 per cent. to 50 per cent. It is reported that the Chicago Coal & Coke Co. has cut off its night operations at the Conroe mill, resulting in a 50 per cent. curtailment. The Kirby Lumber Co., of Houston, Texas, has eased off its production at all plants about 35 per cent. It is understood that all mills of Long-Bell Lumber Co. have curtailed approximately 18 per cent. Other prominent concerns which have initiated curtailed operations are, the Keith Lumber Co., the Beaumont Saw Mills Co., Nona Mills Co., Industrial Lumber Co., Miller-Link Lumber Co., Southern Pine Lumber Co., American Lumber Co., Peavy-Byrnes Lumber Co., South Texas Lumber Co., Chicago Lumber & Coal Co., Thompson Brothers' Lumber Co., Frost-Johnson Lumber Co., Texas Longleaf Lumber Co., Temple Lumber Co., Pickering Lumber Co., Coney Island Lumber Co., and the R. W. Weir Lumber Co. It is also reported that Mississippi mills are generally curtailing operations.

Hardwood Inspection Changes Criticized

Radical Changes to be Discussed at Meeting of National Association—Much Objection Probable

By A. E. Clark

At the annual meeting of the National Hardwood Lumber Association which is to be held in Chicago on June 15th and 16th, the most important matter to come up for discussion will be the report of the inspection rules committee. This report has been prepared and printed and is now in the hands of the members of the assiciation, so that when it is up for discussion everyone will be conversant with its details.

The report calls for a large number of important additions and changes in the inspection rules. From the point of view of Canadian hardwoods, the proposed changes may be briefly summed up. In the case of white ash, for instance, the report of the committee proposes that firsts and seconds should remain as they are; that a grade of "selects" shall be taken out of the upper end of "No. 1 common"; that the grade of "No. 1 common" shall be divided into "No. 1 common A" and "No. 1 common B"; and that the grade of "No. 2 common" shall be divided into "No. 2 common A" and "No. 2 common B."

For the other important Canadian hardwoods, such as black ash, basswood, beech, birch, maple, and soft elm, etc., the grades shall be altered in the same manner as for white ash.

The detailed proposals in connection with Canadian hardwood grading, as included in the rules which are to be discussed, will be clearly shown by the following extract, which shows the grading proposed to be adopted for white ash:—

The Proposed Changes.

Selects

Inspection made from the good side of the piece and the reverse side in pieces 8 feet and over long must work at least 80 per cent. sound.

Bright sap not a defect, admitting 25 per cent. of odd lengths, not over 30 per cent. under 12 feet, and not to exceed 5 per cent. of 6 and 7 feet lengths.

Selects must be 5 inches and over wide, 6 feet and over long.

Pieces 6 and 7 feet long must be clear one face, the reverse side may have one standard defect or its equivalent.

Pieces 5 inches wide, 8 feet and over long, must be clear one face.

Pieces 6 inches and over wide, 8 feet and over long, must grade not below Seconds on the best face.

No. 1 Common A

Inspection is made from the poor side of the piece.

Widths: 3 in. and wider, but not more than 10 per cent. of 3 in. pieces admitted.

Lengths: 4 feet and longer, but not more than 10 per cent. may be 4, 5, 6, and 7 feet lengths.

Pieces 4 and 5 feet long must be clear.

Pieces 3 and 4 inches wide, 6 and 7 feet long, must be clear one face, the reverse side may have one standard defect or its equivalent.

Pieces 3 and 4 inches wide, 8 to 16 feet long, must work 66 2/3 per cent. clear face in not over two pieces.

Pieces 6 feet long, 5 to 8 inches wide, may have one standard defect; pieces 6 feet long, 9 inches and over wide, may have two standard defects.

Pieces 5 to 7 inches wide, 7 to 11 feet long, must work 66 2/3 per cent. clear face in not over two cuttings; pieces 5 to 7 inches wide, 12 feet and over long, must work 66 2/3 per cent. clear face in not over three cuttings.

Pieces 8 inches and over wide, 7 to 9 feet long, must work 66 2/3 per cent. clear face in not over two cuttings; pieces 8 inches and over wide, 10 to 13 feet long, must work 66 2/3 per cent. clear face in not over three cuttings; pieces 8 inches and over wide, 14 feet and over long, must work 66 2/3 per cent. clear face in not over four cuttings.

No cutting to be considered which is less than 4 inches by 2 feet long, or 3 inches wide by 3 feet long.

No. 1 Common—B (New Rule)

Inspection made from the good side of the piece.

Widths: 3 inches and wider.

Lengths: 4 feet and longer, but not more than 10 per cent. may be 4, 5, 6, and 7 feet lengths.

Pieces 4 and 5 feet long must be clear one face, the reverse side sound.

Pieces 3 and 4 inches wide, 6 and 7 feet long, must be clear one face, the reverse side sound.

Pieces 3 and 4 inches wide, 8 to 16 feet long, must work 66 2/3 per cent. clear face in not over two pieces in cuttings by the full width of the piece.

Pieces 6 feet long, 5 to 8 inches wide, may have one standard defect; pieces 6 feet long, 9 inches and over wide, may have two standard defects, the reverse side 90 per cent. sound.

Pieces 5 to 7 inches wide, 7 to 11 feet long, must work 66 2/3 per cent. clear face in not over two cuttings; pieces 5 to 7 inches wide, 12 feet and over long, must work 66 2/3 per cent. clear face in not over three cuttings.

Pieces 8 inches and over wide, 7 to 9 feet long, must work 66 2/3 per cent. clear face in not over two cuttings; pieces 8 inches and over wide, 10 to 13 feet long, must work 66 2/3 per cent. clear face in not over three cuttings; pieces 8 inches and over wide, 14 feet and over long, must work 66 2/3 per cent. clear face in not over four cuttings.

No cutting to be considered which is less than 4 inches wide by 2 feet long, or 3 inches wide by 3 feet long.

No. 2 Common—A (New Rule)

Inspection made from the good side of the piece.

There is no restriction as to heart in the No. 2 common grades.

No. 2 Commons must be 3 inches and over wide, 4 feet and over long, but not more than 10 per cent. of 4 and 5 feet lengths admitted in this grade.

Pieces 3 to 7 inches wide, 4 to 10 feet long must work 50 per cent. clear face in not over three cuttings; pieces 3 to 7 inches wide, 11 feet and longer, must work 50 per cent. clear face in not over four cuttings.

Pieces 8 inches and over wide, 4 to 9 feet long, must work 50 per cent. clear face in not over three cuttings; pieces 8 inches and over wide, 10 to 13 feet long, must work 50 per cent. clear face in not over four cuttings; pieces 8 inches and over wide, 14 feet and over long, must work 50 per cent. clear face in not over five cuttings.

No cutting to be considered which is less than 3 inches wide by two feet long.

No. 2 Common—B

No. 2 Commons must be 3 inches and over wide, 4 feet and over long, but not more than 10 per cent. of 4 and 5-foot lengths admitted in this grade.

Pieces 3 to 7 inches wide, 4 to 10 feet long, must work 50 per cent. sound in not over three cuttings; pieces 3 to 7 inches wide, 11 feet and longer, must work 50 per cent. sound in not over four cuttings.

Pieces 8 inches and over wide 4 to 9 feet long, must work 50 per cent. sound in not over three cuttings; pieces 8 inches and over wide, 10 to 12 feet long. must work 50 per cent. sound in not over four cuttings; pieces 8 inches and over wide, 14 feet and over long, must work 50 per cent. sound in not over five cuttings.

No cutting to be considered which is less than 3 inches wide by 2 feet long.

Former Rules Satisfactory

I would like to draw the attention of those who are interested in the hardwood lumber business in Canada to the fact that the rules as laid down formerly have been successful. They are becoming generally accepted by the consuming trade. The inspectors have been educated through several years of hard work to understand and interpret these rules to the satisfaction of buyers and sellers. Why then should we disrupt the whole situation and try to force the National Hardwood Lumber Association to assume the duties of retail yards by putting up a specific board for every consumer of hardwood lumber?

In the first place, this would entail a complete re-instruction of

Entitled to Congratulations

Editor Canada Lumberman:— Toronto, Ont., May 23.

After an interested perusal, we have just laid down your Annual Issue of May 15th. This is such a decided improvement over previous numbers that we want to take the occasion to congratulate you, because such a manifest effort is entitled to reasonable recognition.

We are, of course, impressed with the increase in size of the issue, but the signal feature, to our mind, is the "editorial and news" section. This shows not alone a vigorous attempt to embrace all items of interest to the trade, but in addition, a fine discrimination in the character and treatment of the items presented.

Please again accept our commendations and our sincere congratulations.

Yours very truly,
Graves, Bigwood & Company,
By A. C. Manbert.

all hardwood inspectors at the different yards. In so far as both Canadian and American markets are concerned, very large proportions of the northern hardwoods are produced at small mills. If a man were to make 200,000 feet of hardwoods and were to cut, say three thicknesses, and then make grades of "firsts" and "seconds," "selects," "No. 1 common A," "No. 1 common B," "No. 2 common A," "No. 2 common B," and "No. 3 common," the quantities in the different piles would be infinitesimally small. This is a position that it is ridiculous to ask any small manufacturer to assume. In other words, it is a question of making a rule that in some cases will benefit a large producer, but in almost all cases will be a serious detriment to the small producer. There is no question that for at least a year's time there would be considerable dispute over the interpretation of these new rules, and this would be at a time when the hardwood lumber business is enjoying some measure of trade revival. It seems anything but fair to the trade to upset all the conditions of prosperity by introducing elements that will cause disputes.

Although I am a member of the Inspection Rules Committee of the National Hardwood Lumber Association, I do not think I am divulging any confidences when I state that a number of the members of this committee were not agreeable to making any change, but since it was put up to the committee to form a new set of rules, we have produced these which are presented as the best we could do, aside from what we had already, and with the hope, in the minds of some of us at any rate, that the good common sense of the members of the association would be exercised to the extent of seeing that they were nothing like equal to the former rules, and that they would be thrown out when they came before the association.

There is no doubt that certain people both in the consuming and producing trades, would benefit by these changes, but I think we, as lumber manufacturers, are big enough now to say that as a benefit to the whole trade they are not to be compared with the old rules, and that when it comes to a vote in the general meeting of the association they will see fit to throw them out. I, personally, shall go to the meeting prepared to adhere to the old rules as being quite equal to our requirements and as having proven very satisfactory to the trade with whom we have dealt. I do not consider that it is necessary for us to enter into retail yard methods in producing and selling hardwood lumber in car load lots.

To show that my views on this matter are to a considerable extent the views of other important hardwood manufacturers, it is only necessary to mention that the Chicago, Philadelphia, and Cincinnati lumbermen have all voiced their opposition to these changes, and other important centres are giving them their definite consideration with a view to following suit.

A Great Opportunity for Douglas Fir Ties

A report upon the market for railway ties, or sleepers, as they are called in India, is published in a recent issue of the Weekly Bulletin of the Department of Trade and Commerce, having been received from Mr. H. R. MacMillan. Mr. MacMillan reports that India has a railway system totalling 35,825 miles of open line, exclusive of double track. Four different gauges are in use. Although one-third of the mileage is laid on steel or cast iron sleepers, the yearly requirement for wooden sleepers is very great. The annual demand for new track, for which metal sleepers are seldom used, is about 1,300,000 sleepers. Renewals use up about 4,000,000 sleepers annually, making a total demand in India each year for 5,300,000 wooden sleepers. Indian forests have never been able to fill this need.

After discussing present sources of supply, Mr. MacMillan reports that there will remain an important market for sleepers from some other country. The only possible important source is creosoted Douglas fir. Summing up his report, Mr. MacMillan says:—

1. There is a shortage of railway sleepers in India amounting to an accumulated deficit of 6,000,000 sleepers and an annual requirement of imported sleepers for renewals of about 1,000,000 sleepers. The programme of railway construction yet to be undertaken will increase the yearly deficit.

2. Metal gives satisfactory service, but the extra cost renders a rapid extension of its use unlikely.

3. Many trials with imported sleepers from all exporting countries within reach have failed to develop a satisfactory source of supply.

4. Amongst the trials made during the past four years with creosoted Douglas fir have been several poorly prepared shipments which are earning a bad reputation for the timber.

5. The opportunity for Douglas fir in a market already importing sleepers at the rate of $1,250,000 per year, is so great that sleeper exporters should give particular care to developing and producing a creosoted Douglas fir sleeper suitable for the Indian market.

The Commissioner of Commerce, Ottawa, Canada, has been furnished with a list of the railroads in India, their managers, engineers, headquarters, miles of track of different gauges, and present types of rail and sleepers in use.

Railway sleepers enter India free of customs duty.

Never Saw Its Equal

Editor Canada Lumberman:— New York, May 24.

I have carefully perused the Annual Number of the Canada Lumberman, and it certainly looks good. The cover, in particular, is the thing that captured my eye, and I notice the good use some of your advertisers made of the color inside.

I am not a knocker of American (perhaps I should say United States products) but I have never seen a United States lumber paper as nicely gotten up as your May 15th issue.

I also noted the "technical meat" contained in the paper and have already made good use of some of the ideas brought out.

Hoping to see the good work continued,

Yours truly,

W. F. Schaphorst.

Query and Comment

New Brunswick Hardwoods

Will you be good enough to give us any data obtainable regarding the quantity and quality of birch grown in New Brunswick, and also advise us whether that province produces any elm, and in what districts it may be found?—Trenton Cooperage Mills Limited.

The Forestry Branch of the Department of the Interior, Ottawa, report that birch is the most important hardwood cut in New Brunswick and is made up of the wood of several species of which yellow birch (Betula lutea) is the most important. The birches are found over the entire province. The only elm cut into lumber in New Brunswick is the white elm (Ulmus americana) and the quantity sawn is almost negligible, representing only 6,000 feet B. M. in 1914.

The Department of Lands and Mines, Fredericton, N. B., report that the quality of birch grown in New Brunswick is first class. There are large quantities of this timber in the northern section of the province, particularly on the line of the Intercolonial Railway, between Campbellton and St. Leonards. All the lands along the line of the railway are under timber license. The International is now owned by the Intercolonial Railway, and information regarding freight, charges, etc., for shipment of timber in this district may be had from their head office at Moncton, N.B.

Elm is found only in the valleys of a few of the streams in New Brunswick, and practically none of it has ever been brought to market.

In bulletin No. 44 of the Forestry Branch of the Department of the Interior the following reference is made to birch in the Maritime Provinces:—

"Birch is the most important hardwood in the Maritime Provinces, as it is also in Canada as a whole. Of the native material the greater part is probably yellow birch (Betula lutea), with smaller quantities of paper birch (Betula alba var. papyrifers), sweet birch (Betula lenta) and gray or wire birch (Betula populifolia). The wood imported from other parts of Canada would be of a similar nature, while that purchased in the United States is probably made up of sweet birch almost entirely.

In general, the wood of birch is fairly hard and strong, with a fine even grain and texture. It is very perishable in moist situations, and checks and shrinks considerably in seasoning. The wood is easily worked, takes a high polish and has a pleasing figure and appearance when finished.

Sweet birch possesses these good qualities in the highest degree and is considered the best lumber species. Yellow birch is lighter in color and weight, and has a greater percentage of the less valuable sapwood. Paper birch is tougher than either of the preceding, and its wood is very light and white in color. Gray birch is almost entirely confined to the Maritime Provinces in Canada. Its wood is grayish-white in color and probably the toughest of all the birches, but, at the same time, the least durable in moist situations.

Birch, like spruce and pine, is used in sixteen of the wood-using industries of the Maritime Provinces. This wood heads the list in seven industries and is used in greatest quantities by the manufacturers of hardwood flooring, furniture, cars and building material, who together use 68.7 per cent. of the total quantity used in the region.

Only 45,000 feet of birch were reported as having been purchased outside of the Maritime Provinces. Of this small quantity (0.3 per cent. of the total) the greater part came from the United States, and the remainder from Ontario and Quebec.

According to the latest report of the production of lumber in Canada the output of birch in New Brunswick during 1914 was 8,034,000 feet B. M., as compared with 5,749,000 feet B. M., in 1913.

Lumbering Industry of Newfoundland

Removal of Export Prohibition a Boon to the Trade—Great Expansion and Progress in All Lines

By J. W. McGrath

St. John's, Newfoundland, (Special to the Canada Lumberman): During the past year, as the result of legislation, introduced and passed in the Newfoundland Legislature, an important change has been effected regarding the future lumber export trade of the Colony.

In 1905 the timber exports from Newfoundland amounted to the approximate total of 15,000,000 feet, and were valued at $200,000. In that year prohibitive legislation was enacted regarding the export of raw timber, and henceforth the annual export of unsawn wood from the Colony became a negligable quantity; about a quarter of a million feet yearly.

The act of last year repealed the law enforced in 1905, and as a result the export of raw timber from the Colony during the year has been revived on a great scale, and every thing points to a very large industry being developed during the coming year.

The matter of permitting the export of raw timber from the Colony was the result of representation being made to the Newfoundland Government from England, showing the great necessity for securing ample supplies of pit-props and pit-wood for English and French collieries. In response to this appeal the government, while repealing the old act, made export from Newfoundland proper a war measure, that is, the concession to last as long as the war. The act, however, as it applied to Labrador, contained no such limitations. It was passed for development purposes, and henceforth the export of unsawn timber from Labrador will be permitted indefinitely. The excellent results which have accrued from the new measure during the past year will, it is extremely probable, influence the government to allow the export to continue indefinitely from Newfoundland also.

The Pit-Prop Industry

The new Act came into operation during the winter session of the Legislature of 1915, which did not meet till late in the winter, and consequently there was comparatively little time left for much pit-prop cutting to be done before the lumbering season ended. The total cut of pit props, however, exported from the Colony last summer to England was approximately 125,000 cords.

Early last fall, several representatives of English colleries, and of firms dealing in pit props came to Newfoundland and gave a number of contracts to local timber dealers, to be filled during the winter. One or two agents, however, representing the largest colleries in England, purchased timber areas in the country, and on these during the winter a large number of men were employed cutting pit props. Those who have bought and worked timberlands will effect a good saving by eliminating the middleman's profit. It is also understood that, even after the war ends, those English firms who have either bought or will buy timber limits will use them permanently as a source of supply, instead of, as heretofore, securing the product in Scandinavian countries.

During the past winter a conservative estimate places the amount of pit props cut in Newfoundland alone at 250,000 cords. The number of men engaged in cutting was very great, for, besides those who were employed by contractors, a great many remained at home, and engaged in cutting there, as the law permitted cutting on the three mile limit.

The price per cord which was formerly being paid for the wood was most unsatisfactory. During the winter 1914-1915, the men who engaged in cutting did so in some cases at a price of $2.50 per cord, and at the end of the season found themselves with scarcely any net returns for the winter's work. This year the government took the matter up, and the price of pit props was arbitrarily fixed. Henceforth the price must not be less than $4 per cord for unrinded wood, while the props rinded, barked and ready for shipment bring $5.00 per cord.

As in one year the cut of pit props has been more than double the previous year's cut, every indication points to the likelihood of this year's cut of 250,000 cords being doubled next year, so that henceforth Newfoundland may be expected to become an important producer of this article for the European markets. Compared to the rest of British North America, Newfoundland in supplying pit props to England possesses two great advantages. In the first place labor in this colony is undoubtedly cheaper than anywhere in Canada. And in the second place the coast of Newfoundland is from three to four hundred miles nearer to England than is any shipping port in Eastern Canada. These advantages may be expected to be an important factor in developing the industry.

At the present date there are leased in Newfoundland 25,000 square miles of timber lands. All these areas have been surveyed, and the rentals are being paid only on what is entirely timber, some sixteen thousand square miles. Assuming that this bears ten cords of pit props an acre, the country at present holds some 90,500,000 cords of pit props, conservatively estimated.

There are besides this extent of timber under lease, large areas of what are considered fairly good limits of forested land not under lease, and a large area of the best wooded land in the country which is held as a Crown reserve.

In Newfoundland-Labrador there are now 22,000 square miles of timber land under lease. And it is estimated that of this area about 15,000 square miles may be considered to be well timbered, and from this area it is computed that 64,000,000 cords of pit props could be taken. There are also on Labrador, other very large areas of good timber not leased, in the disputed zone between Newfoundland and Canadian territories. Practically all this timber is spruce, about 92 per cent., the remainder consists of a mixture largely of birch and pine. The fibre of the Newfoundland spruce is peculiarly adapted to make the wood excellent material for the manufacture of pulp and paper, while the forests of Labrador are remarkable for the tenacity and soundness of the wood. The writer has seen spruce boards, which were used to construct fishing stages, in Labrador, which were exposed without any kind of paint to all the rigors of that varying climate. These boards were more than forty years old—some of them, and yet there was no sign of decay.

Scarcity of Tonnage

The scarcity of tonnage for shipping this year's cut of timber to Europe has become acute. Altogether this spring no less than thirty vessels and steamers have been bought in the United States and Canada, at prices heretofore unthought of.

The old wooden fleet of Newfoundland sealing steamers, which, ever since being built, more than thirty years ago, were considered suitable for any work but sealing, are being extensively altered to be used for freighting timber to England during the summer. This fleet, which numbers ten or twelve steamers of about 1,400 tons each, will be most valuable, and in addition to other ships will guarantee the export of the entire cut of last winter, sooner or later during the year. The rate of trans-Atlantic freights, although excessive, is still somewhat below that demanded for shipments made from Canadian ports.

Export Trade in Pulp and Paper

During the past year Newfoundland outdistanced all other countries in supplying "news" paper to the United Kingdom. In prewar times the United Kingdom supplemented its own production of paper, produced from imported wood pulp, by imports of the finished product, principally from Norway, Sweden and Newfoundland. Norway was always, for a number of years, the chief source, contributing about 85 per cent. of the total imported finished product. During the past year, Newfoundland assumed the premier position, supplying 34.7 per cent., while Norway was relegated to a second place, supplying 33.5 per cent. The total amount of newsprint contributed last year by Newfoundland was 477,896 tons. The Anglo-American Development Company, Limited, who operate large pulp and paper mills in the country declared the first dividend since the opening of the mills seven years ago. This dividend, after all depreciation was allowed for, amounted to £51,350 0s. 8d. The mills are owned by Lord Northcliffe, and cost $15,000,000.

At the present time a company known as the Newfoundland Products Corporation, of whom the Reid Bros., who are large railroad owners in this country, are the chief promoters, and owners of a large part of the stock of the company, is being financed in New York. Mills with an annual output of 100,000 cords of spruce pulpwood will be erected. A sulphite pulp mill is also to be installed having a yearly production of 36,000 tons of sulphite pulp. An electric bleaching plant is to be used. The Corporation has already expended in Newfoundland, in surveying lands, etc., in connection with the establishment of the plant, about one million dollars.

The travelling trade commission appointed by Sir Geo. Foster to visit Great Britain, France, Belgium, Italy, and possibly Russia, has sailed for Europe, and will be absent for three or four months. Mr. Roy Campbell, secretary of the Canadian Pulp and Paper Association, a son of Mr. A. C. Campbell, of the Hansard staff of the House of Commons, and secretary of the Montreal branch of the Manufacturers' Association, was apointed secretary of the commission.

Cost of Making 9.2 Shell Boxes

Analysis by a Manufacturer Shows Contract Prices Are Far Below Safety Margin*

On several occasions we have been informed that some firms quoting prices on shell boxes have submitted bids which rendered them a distinctly unsafe proposition, and certain figures laid before us seem to indicate that there is foundation for the statement. As a result of enquiries at some of the box factories where these boxes are being made, we give below a copy of the cost sheet on the 9.2 shell box, 300,000 of which have been recently let out at 95c. each. By referring to this cost sheet it will be seen that the actual amount of lumber required has been figured exactly, and an allowance made for waste, as is the usual practice. Then a manufacturing cost covering the price of the shook ready to be assembled, plus cost of manufacturing and delivery, is added, which amounts to $1.26, a total well over 95c., the price at which the business was placed. Adding a reasonable amount for operating expenses, which every sound business man understands to be absolutely necessary, for the safe conduct of his business, we have a price of $1.66.

If a manufacturer, for reasons of his own, desired to disregard entirely his profit and operating expenses, outside of labor, he would be able to make a price of $1.55, but it is difficult to understand how any man at all familiar with lumber could go so far as to quote a price on this box which will not see him through on the bare cost of the lumber and other material, at the prices which are actually in force at the present time, which will go considerably higher before the completion of his order. Business like this is distinctly unsafe, not only for the man who is doing the manufacturing, but also for those who are furnishing him material of any sort or description, and more especially for those who are advancing the money to finance his aperations.

Following is the cost sheet for the 9.2 shell box:—

2 sides, spruce,	30 x 12⅝ x 1⅜ =	7.89
2 T. & B., spruce	30 x 9⅞ x 1⅜ =	6.16
4 inside angles, spruce	12 x 2½ x 2½ =	2.07
		16.12 ft.
Waste, plus 15%=19.00 ft. at 2½c. per ft.		47½c.
Labor on shook, $5.55		10½c.
3 ends, birch	9⅞ x 9⅞ x ⅞ =	2.00
1 end, birch	12⅝ x 12⅝ x ⅞ =	1.11
2 handle blocks	2¾ x 5½ x ⅞ =	.25
		3.36 ft
Waste, plus 15%=3.95 ft. at 3c. per ft.		11¾c.
Labor on shook, $5.55		2¼c.
		72c.
2 bands, 57½ in. long		12c.
2 rope handles		8c.
20 screws, 1 in. x No. 12	$1.40 Less 80	
20 screws, 2¼ in. x No. 12	2.20 and 5%.	
10 screws, 1¾ in. x No. 12	1.80	
8 screws, 1½ in. x No. 12	1.65	14½c.
Nails		3½c.
		38c.
Assembly		11c.
Delivery		5c.
		$1.26
Overhead and general expense, 20%		1.58
Profit, 5%		1.66

Infected Lumber Found in Retail Yards

The United States Forest Products Laboratory, in its annual report, refers to studies that have been made with a view to determining the extent and cause of the decay existing in stored timber and the relation of this to outbreaks of rot in buildings. These studies show that an exceedingly bad condition exists in many lumber yards in respect to the sanitary handling of timber. The majority of dealers do not realize the full danger in supplying infected stock to the building trades, and take few precautions to maintain their material in sound condition. The "house fungus" (Merulius lachrymas) of Europe was found widely distributed in lumber yards in the eastern United States. Since the same fungus is often found in buildings in the same localities, it is probable that it is introduced in infected building material. It is hoped that through these investigations lumber dealers will be led to give greater attention to keeping their yards in sanitary condition.

Continuous Stock Inspection

In a recent issue of this journal a correspondent said that one of the drawbacks of fast-feed machines is that so little time is available for properly facing and graining stock. And in the last paragraph of his article he strikes the keynote of the chord when he remarks that "the use of the automatic feeding table gives the feeder the time he needs for graining and facing the stock."

The automatic self-feed has come to stay, and it will be but a short time before the hopper feed will be provided for almost every sort of machine and will handle both long and short lengths, or all long or all short, with ease and certainty. It will perhaps not retain the vertical form which it now has in some well-known machines, but a form of automatic feed may be looked for wherein the various pieces and lengths are taken from a "side-by-side, edgewise, and horizontal arrangement," which will bring forward and feed almost any width or length of stock.

But the facing and graining of stock should not be confined to the feed table; it should be under the inspection from the time it enters the mill until it is delivered in finished form. When ripping stock it should be the business of the sawyer to hold up every piece which will not make a first-class bit of blank stock. The cut-off sawyer who handles this stock should never let a bad knot, a split or a shake get past him, and when the strips closely resemble rainbows, they should be cut short enough that the dressed stock may be forced into place. Stock which will not come up to requirements should be "scrapped" by each and every man whose hands it may pass through.

A case in point: in a shop where thin stock was worked a good deal, being planed, ripped and cut to lengths, then the ends scarfed, glued into hoops and steamed, bent, glued, dried, and afterwards turned and smoothed in a lathe, there was a lot of stock run through which had to be rejected after several operations had been performed upon it. There seemed to be no system of inspection whatever. A machine man who came to a piece which could not possibly make a finished article, never thought of throwing it out, but passed it through his machine. A change of foremen in this shop resulted in a big change in the manner of handling work, and now every man who handles a piece of stock is an inspector, with full power and orders to reject each piece which will not make a perfect article when finished.

The cost of the finished article has been reduced fully 20 per cent. by this method of continuous inspection, and there has also been a big saving in stock. The pieces rejected at early stages of manufacture are now diverted to other uses, whereas formerly they went to the boiler furnace. Continuous inspection in this shop now begins with the man who receives and measures the lumber as it is unloaded into the stock room. And he is not afraid of hurting anybody's feelings, for he rejects promptly and finally such pieces as will not come up to the shop specifications and requirements.

When the stock is piled in storage to remain until machined, it is separated as far as possible into grades, and the laborers who do the piling have been taught to sort and separate the stock with a good deal of cleverness. The cut-off sawyer rejects freely, and the rip sawyer throws out every piece which does not look good to him. Then the man who planes the stock and scarfs the ends has a considerable number of culls to his credit, upon which all succeeding operations are prevented and their cost saved. The party who places the blanks in the steam retort finds a few which are to be rejected, and he also finds a few more which are thrown out instead of going to the bending machine.

This system works so well that it should be adopted in some form in each wood-working shop in the country, no matter how large or how small. By this method every man becomes an inspector, and is alert at all times to stop any defective piece, thereby saving money and time for the shop. There is a good deal which may be done by each man through whose hands stock may pass, to machine each piece to the best advantage. When, through fast feeding, small or short stock, or other reasons, the man who keeps the feed tables supplied cannot face and grain properly, he should be given assistance. The result will be a great improvement in the finished product and an almost entire absence of roughly-machined pieces, chipped-off ends, and other defects due to running stock against the grain.

Try continuous inspection in your shop. It may be a bit troublesome to educate the machine operators up to it, but by the time one or two have been quietly dropped for failure to inspect, the others will have found it decidedly to their advantage to fall into the scheme, for it makes their own work easier and better. Try it once and you will never regret or abolish it. And the workmen, after they have once "caught on" to the benefits they derive from the system, do not care to abolish it.—J. F. H., in The Woodworker, Indianapolis.

The 19th annual convention of the National Hardwood Lumber Association will be held at Chicago on June 15th and 16th. Among the important matters to be dealt with are important proposed alterations in the grading rules.

Decay in Timber Prevented by Treatment

An Account of Methods in Use in Canada—Usefulness and Life of Timber Increased by Scientific Preservation

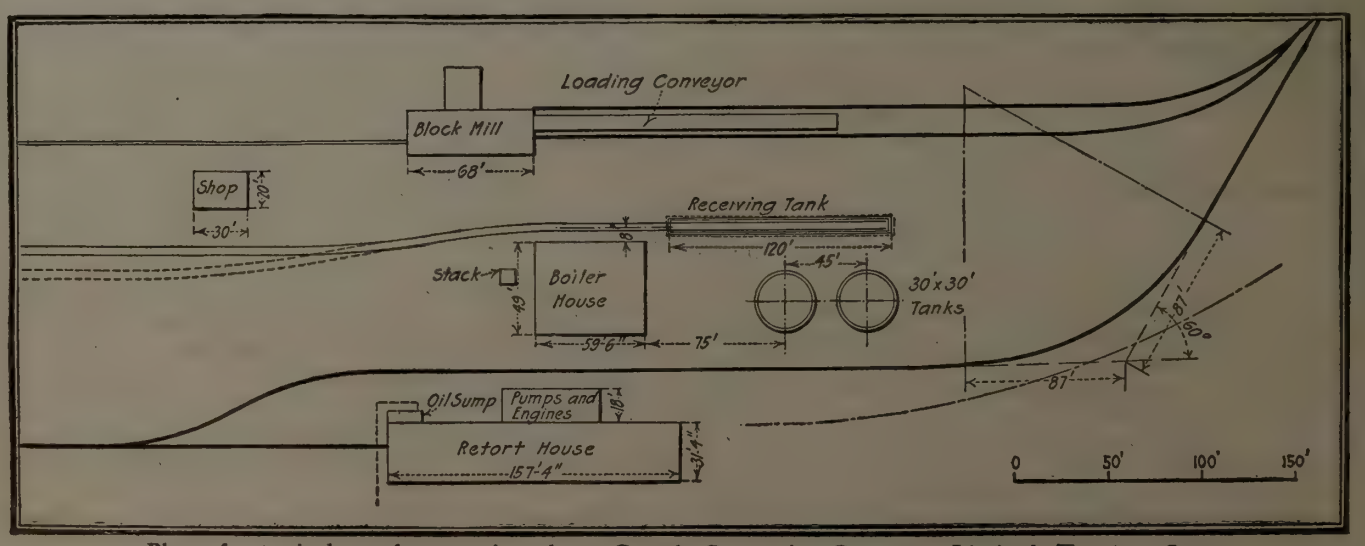
THE preservation of timber has only been developed to any considerable extent in Canada during the last few years. Even as yet, there is subjected to preservative treatment only a small percentage of the amount of timber used annually for construction purposes in which preservation would increase its usefulness. Moreover, there is an extensive field waiting to be exploited in the wood block paving line, which will consume enormous quantities of wood when the trade has been properly developed. A substantial beginning has been made, however, and it has been practically assured that the wood preserving industry in Canada will increase rapidly during the next few years. The lumber manufacturing industry is closely affected by this development. The preservation of wood by a comparatively inexpensive process, widens its market greatly, not only increasing the uses to which it can be put, but assisting it in meeting the competition of substitutes.

It is difficult to account for the failure of the lumber manufacturing industry in Canada to realize this more fully than it has, although we believe that this apparent indifference to important market possibilities will disappear rapidly once the lumbermen have had a fair taste of the increased trade which the pioneer wood preserving companies of Canada are working up for them. Unquestionably the manufacturers of Norway pine, for instance, have neglected a splendid opportunity so far in connection with the wood block paving business and have permitted their more aggressive competitors, the manufacturers of yellow pine, to create prejudice in favor of their product which will only be overcome with considerable difficulty. It is time that the Norway pine producers and the producers of other Canadian woods suitable for wood block paving, Douglas fir for instance, should organize something definite in the way of a campaign, or an Association even, for getting their share of this business which promises to be of great extent in the near future.

The growth of the wood preserving industry in Canada during the last few years has been intimately associated with the growth of our railways. We now have some 30,000 miles of railway in Canada, compared with one half that amount 20 years ago—and the increasing cost and decreasing supply of good ties, has attracted the attention of the wood preserving industry to the Dominion. Forestry experts claim it takes sixty years to grow a tie, and that we place it in the track to rot out in from five to seven years, whereas it would give from eighteen to twenty-five years' service if presevred, or treated, before being used.

On this continent in 1885 only 120,000 ties were treated out of a total of 50,000,000 used, while in 1912 about 30,000,000 were treated out of about 150,000,000 used. In other words, only about 1/400th part of the ties were preserved in 1885, while in 1912 1/5th of all the ties used were treated. In Canada alone in 1910 practically no treated ties were used. In 1911, 200,000 ties were preserved before being placed in the roadbed. This was 1.4 per cent. of the total number used. Last year about 2,500,000 ties were treated, or 10 per cent. of the total number used. This shows that the Canadian railways have commenced the battle against rot.

Rot is the chief cause of failure of timbers such as ties, paving



Plan of a typical wood preserving plant—Canada Creosoting Company, Limited, Trenton, Ont.

blocks, piles, etc. It is the breaking down of wood fibre that is caused by the growth of small plant organisms known as fungi. The spores or seeds of the fungi, which are usually carried by the wind, alight on timber and grow, sending microscopic threads or rootlets into the timber. These organisms live on the timber as food, causing the eating away or breaking down of the wood fibre.

Certain amounts of each of four things are absolutely essential to the existence of these fungi; namely, air, moisture, heat and food. Take away entirely any one of these four, and the fungi cannot live. The timber cannot be protected from air except in occasional instances, such as piles that are entirely submerged, in which case the timber needs no other protection from fungi, but may be exposed to teredo attacks.

It is also difficult, as a rule, to protect the timber from moisture, but where it can be so protected the growth of the fungi is stopped. This is shown, for instance, by the excellent condition in which one often finds very old timber in interior construction.

If one could keep timber at or below the freezing point—say, in a cold storage plant—fungi could not live; but from the practical standpoint it is impossible to protect timber from heat.

Therefore, the only thing that can be affected to destroy the growth of the fungi—the only one of the four essential conditions that can be removed—is food. The fungi have only the wood fibre for food, and if that food can be rendered poisonous, the wood will be preserved against their attacks. This is done by treating the wood with a highly antiseptic fluid.

To treat a tie properly in order to preserve it against decay requires a modern treating plant of considerable cost and complexity. In 1885 there were only three of these plants in operation on the continent, while there are now over one hundred such plants in existence, with an aggregate capacity of over 100,000,000 ties a year. In Canada we have but five of these plants, all built within the last four years, with an aggregate capacity of approximately 4,500,000 ties per annum. These plants are located at Sydney, N.S.; Fort Frances, Ont.; Trenton, Ont.; Transcona, Man., and Vancouver, B. C.

Such plants consist of retorts, pressure pumps, vacuum pumps, proper gauges, storage tanks, measuring tanks, etc. Fig. B is an interior view of the retort house at the Trenton plant. The retort (1) is shown at the right of the photograph. It is 134 feet long, 7 feet in diameter, and has a net capacity of about 2,500 cubic feet of wood. The retort is built of riveted boiler plate to withstand 225 pounds pressure per square inch. There is a door (2) at each end which is securely bolted and sealed after the retort has been charged. A receiving tank (3) holds the creosote oil that is drained from the retort after the finish of the pressure treatment, and also after the finish of the vacuum treatment. A centrifugal pump (4) forces this oil from the receiving tank to the overhead tank (5), from which the supply is drawn when the treatment is begun.

Steam coils run along the bottom of the retort for its entire length in order to regulate the temperature of the preservative during treatment.

At the operator's station is a board on which is mounted a number of gauges, both indicating and recording. One gauge indicates the pressure in the retort and one records it on a timed sheet. The amount of vacuum is indicated by another gauge and recorded, with the time, by still another. The temperature is indicated and recorded according to time.

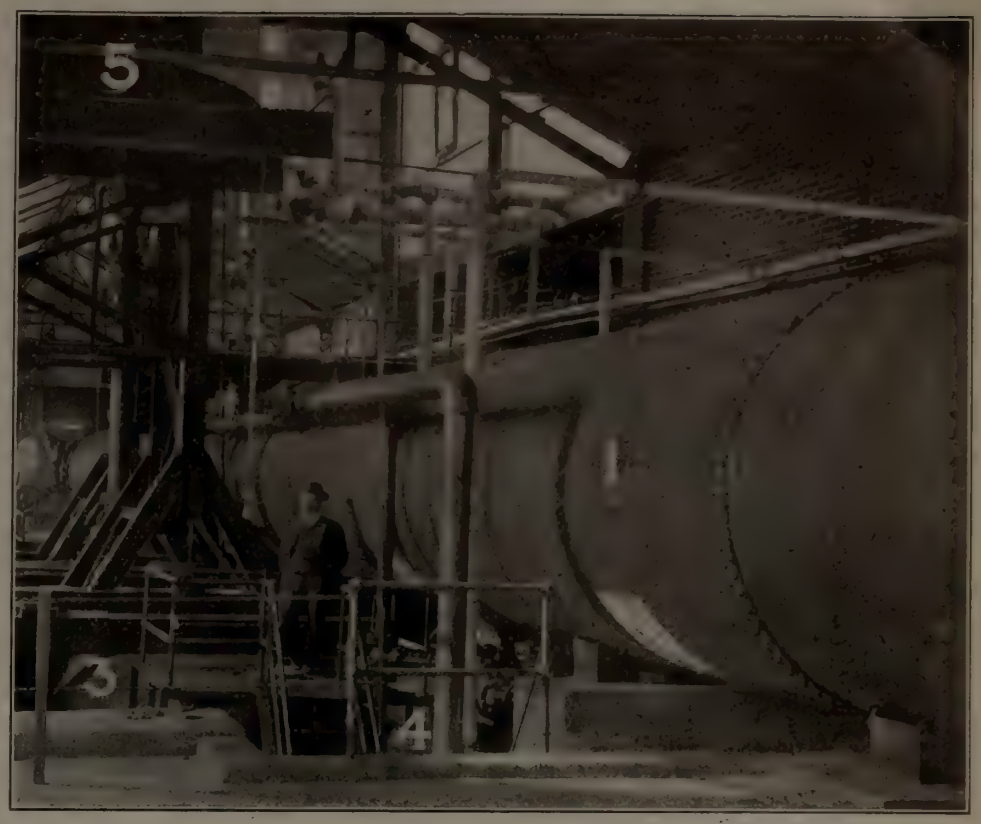


Fig. B.—Interior of retort house. 1, Retort. 2, Retort door. 3, Receiving tank. 4, Pump. 5, Overhead tank.

Among the plant's equipment are several trains of tram cars, such as are shown in the centre of Fig. C. These are used to convey the ties and lumber into the retort for treatment. Sixteen tie lengths are used to make up a train; a tie length to each tram car; each tram car holding about 60 ties. The train is pushed by an electric locomotive right into the retort. The cars are not coupled, but are so constructed that they can push against each other without disturbing the load, a cast steel bumper being attached to each end of every car. A wire cable is fastened to the car farthest from the locomotive, so the train is easily drawn out.

A different type of tram is used for treating paving blocks. A train of them is shown at the left of Fig. D. After these trams are filled with blocks, a perforated slide closes across the top of each tram, holding the blocks in place but allowing the creosote oil to flow through the perforations and fill the car.

The paving block mill which operates in connection with the treating plant and manufactures the lumber into paving blocks, consists of a conveyor, a planing mill, saw tables with saws, etc. Seasoned lumber is loaded onto the conveyor, shown in the foreground of Fig. A, which carries it into the block mill. It passes on five rolls in a straight line through the planer and onto the saw table, on which it is fed into a mill of from sixteen to twenty saws which cut fifteen to nineteen blocks at a time. The sawn blocks drop onto another conveyer which carries them from the mill. As they pass out they are inspected and, from the conveyer shown in Fig. D, they are loaded

Fig. C.—Train of ties just drawn from retort, and one type of the trams used.

into the cages, as the paving block trams are called. Sixteen of these cages are used to make up a train for each charge. Each cage contains about forty square yards of blocks.

Ties and timbers from the seasoning yard are loaded onto tram cars such as are shown in the centre of Fig. C and a number of trams placed together to make a train such as is shown at the left of Fig. C, ready to be pushed by the electric locomotive into the retort. The trains of block cages are made up at the conveyer at the end of the block mill, as shown in Fig. D, where they have been filled with blocks.

When the treatment is started after a train of paving blocks, ties or lumber has been placed in the retort, and the end doors closed and hermetically sealed, oil is allowed to flow into the retort from the overhead tank, filling the voids around the timber. Then by means of steam pumps additional oil is forced into the retort to obtain the amount of pressure required to saturate the wood thoroughly, 100 to 180 pounds pressure being used, according to the kind of wood. Upon completion of the pressure treatment the pressure is released and the oil is rapidly drawn into the receiving tank. A vacuum of from 23 to 27 inches is then quickly created in the retort by means of a special arrangement of vacuum pump and condenser. This vacuum is sustained from an hour to an hour and a half, and draws from the wood the surplus oil. After this surplus oil is drawn off, the doors of the retort can be opened and the train withdrawn.

During the treatment heat plays an important part as well as pressure and vacuum. The temperature during the pressure treatment is never allowed to drop below 150 degrees F., nor to rise above 190 degrees F. The degree of penetration depends largely upon the temperature of the oil; the higher the temperature, within certain limits, the freer the liquid will flow and the more easily it will enter the pores of the timber after the timber has become warm and the pores expanded by the heat. Some kinds of wood offer little resistance to the oil, while other kinds offer great resistance, depending on the size of the pores, the smoothness of the cell walls and the extent to which material obstructions are contained in the cells. The temperature, pressure, vaccuum, etc., etc., are readily regulated by the operator, all valves and the controlling apparatus being near the station from which he watches the proceess.

A complete record is kept so that any official of the creosoting company, or the customer's representatives, can check the operator's discretion and skill. These records are kept, and should it be desired to refer to them at any time for any reason, after a lapse of many years, one can easily do so.

A clocklike device shows the amount of oil in the overhead tank, both before and after treatment. The difference, of course, is the net amount left in the charge. This method is remarkably accurate. It is checked up monthly by actual and precise measurements, and is also verified by weighing the timber before and after treatment. The whole process of treatment takes from three to five hours for ties and from four to eight hours for paving blocks. If the ties are well barked, in good condition and well seasoned, the treatment does not take so long as it does otherwise.

Various preservative fluids are employed, but that which is in most general use is creosote oil. Of the five plants in Canada equipped for preserving wood on a large scale, all except one use creosote oil. The plant at Fort Frances, Ont., uses chloride of zinc. Unless the timber is penetrated so deeply with the preservative that checks or openings cannot reach beyond the treated zone, the spores will find their way in through the checks to the untreated portion and cause interior rot, which is frequently misnamed "dry rot." The depth of penetration of the creosote oil depends on the amount of oil that is forced into the wood, yet it is not necessary for the preservation of the timber to leave so much oil in the timber as must be put into it in order to obtain the required penetration. Therefore, many plants use the process whereby a large quantity of oil is forced into the timber, thus insuring thorough penetration, but whereby a considerable portion of this oil is afterwards drawn from the timber by the creation of a high vacuum. This leaves in the timber only the amount of oil that is needed, and the oil is evenly distributed throughout the timber (except impenetrable heart wood), instead of simply being distributed densely at the surface. By this method proper penetration can be secured without adding so greatly to the cost as would be done if all the oil were left in the timber that had been put in to obtain the penetration.

Following is the record of a treatment recently given an order of Norway pine paving blocks, three inches wide by four inches deep, for the City of Toronto:

Gross lbs. creosote oil in each cubic foot of timber at end of pressure.	Net lbs. oil remaining in each cubic foot at end of vacuum.
24.35	22.41
25.20	19.61
26.60	19.57
26.50	20.61
27.03	21.53
25.74	20.64
24.80	19.01

The objective was a twenty-pound treatment. It will be seen that the net average was 20.48 pounds. These blocks were treated at the plant of the Canada Creosoting Company, Limited, at Trenton, Ont.

After the blocks, ties or timbers have been treated, the penetration is inspected by the representatives of any inspection company who may be present on behalf of the purchasers of the materials, by cutting the blocks in two by means of a hatchet, or extracting small borings from the ties and timbers. These borings are made with a Swedish instrument which resembles a miniature core drill in its action. A perfect core several inches long and about 3/16ths of an inch in diameter is taken out of each timber that is bored. Examination of these cores shows the depth and uniformity of penetration.

The method of loading ties onto the railroad cars after treatment is shown at the right of Fig. C. The handling of large timbers, both before and after treatment, is all done mechanically.

Before ties and timbers are treated, or before lumber is cut into paving blocks, it is stacked on the seasoning yard for months, to become properly seasoned. The lumber is stacked in open piles, so as to permit the free circulation of air, for three to five months. The ties are piled in such a manner as will permit of good air circulation and at the same time not allow sufficient exposure to cause checking. It requires from 6 to 10 months to season ties properly. Fig. E shows the manner of piling ties.

Fig. A is a general view of the Trenton plant. The buildings, reading from the left to right, are the block mill, machine shop, boiler house, office and retort house. The company also owns its own tie camp, north of Trenton, which it organized in order to get hardwood ties.

The trestlike structure in Fig. D is the conveyer running out from the block mill. The sawn blocks are carried out on this conveyer. Chutes will be noticed running from the conveyer to the cars,

Fig. D.—Conveyor filling trams with paving blocks. Storage tanks in background.

Fig. E.—Tie stacking yard.

and when the cars are pulled into place under these chutes, trap doors are opened in the conveyer just over the chutes and the cars are filled. In the background of Fig. D can be seen large tanks for storing oil, holding 150,000 gallons each.

Creosote oil, the preservative used at the Trenton plant, is defined scientifically as any and all distillate oils boiling between 200 degrees and 400 degrees C. which are obtained by straight distillation from tars consisting principally of compounds belonging to the aromatic series and containing well-defined amounts of phenoloids. Or, to be less technical, creosote oil might be defined as a distillate from the tar which is produced as a by-product in the manufacture of coal gas from bituminous coal by the retort method; or a distillate from the tar which is produced as a by-product in the manufacture of coke from bituminous mixture of these two kinds of tar.

Creosote oil is highly antiseptic and thoroughly protects the timber against fungus growths. For ties, eight to twelve pounds per cubic foot (about 2½ gallons per tie) is left in the timber, while for paving blocks from sixteen to twenty pounds per cubic foot is left in. Creosote oil may have a preservative value from physical properties as well as from its antiseptic or poisonous nature. This is especially true when applied to paving blocks. It may be capable of adhering to the cell walls and fibre of the wood with such permanency as to prevent conditions favorable for the development of elements destructive to timber. With the idea of obtaining the greatest prevention, both chemically and physically, pure coal-tar of low carbon content is frequently mixed with the creosote oil.

Recently there threatened to be a serious shortage of creosote oil on this continent owing to the war in Europe, but the release by the British government of a number of cargoes of creosote oil helped the situation. England and Germany are the leading producers of creosote oil distilled from coke-oven coal-tar. When coke is manufactured in bee-hive ovens the coal-tar is burned in the process. On this continent most coke ovens are of the bee-hive type, while in Europe they are of the by-product type. Therefore we are largely dependent on Europe for our supply of coal-tar and creosote. The only by-product ovens in Canada are at Sydney, N.S., and Sault Ste. Marie, Ont. A bee-hive oven costs only about one-third or one-fourth as much as a by-product oven, which explains the popularity of the bee-hive ovens. The quality of coal for cooking in Europe is not so good as on this continent, and requires the by-product oven in order to make the greatest quantity and best grade of coke. Therefore the use of the more expensive by-product oven is not altogether a matter of choice in Europe.

Creosote oil is one of the fractions of crude coal-tar obtained by its distillation. It is the fraction coming off between the benzol and carbolic acid compounds, which come off at low temperatures, and the pitch, which remains in the still at the highest temperatures. Coal-gas tar usually has a high percentage of free carbon which should be filtered out, or otherwise removed, before such tar is ever mixed with creosote oil. Refined coal-tar is often added to the creosote oil in preparing it for use in wood preservation, as the treatment is more permanent when the mixture is used than when only creosote oils of low specific gravity are used, as there is a marked evaporation of the low-boiling fraction of the creosote oil. The coal-tar and the creosote oil, when mixed, combine thoroughly, and cannot be separated again, either physically or chemically.

Up to the present only wood block and ties have been treated at Trenton, but it is expected to treat timber for station and outdoor platforms; switch ties; dimension timbers; decking; flooring for docks, bridges, fire halls, warehouses and heavy manufacturing plants; crossing planks; fence posts; signal poles; snow fences; piling; mine props; telegraph and telephone poles; cross arms; mine timbers; tie plugs; wooden pipe; and all material for breakwater and marine work.

The first ties ever treated in eastern Canada from Canadian timber were creosoted at the Trenton plant in September 1914, for the Toronto, Hamilton and Buffalo Railway. The only woods used so far have been beech, birch and maple for ties, and southern yellow pine and Norway pine for wood block, but spruce, tamarack, fir, hemlock and other woods will probably be treated later on.

Special attention will be given to the treatment of mine props, as timbers for use in mines decay very readily, owing to ideal conditions of moisture and temperature for fungus growth. Much of the failure of mine props now attributed to breaking and splitting is due primarily to rot. This can be prevented, and the original strength of the timber maintained, by creosoting or otherwise preserving it. The creosoting of mine timbers is not so expensive as some other forms of creosoting, because it is not necessary to obtain such great penetration. The uniformity of temperature and moisture in mines, and the lack of exposure to the direct rays of the sun, result in no checking taking place, so that it is not necessary to get such deep penetration. A much lighter treatment than is given other timbers will therefore prove satisfactory. But this does not necessarily mean that any merely superficial treatment is sufficient.

The difference in strength between untreated and treated ties and timbers, except in the case of those treated with heavy oils which protect the timber from excessive moisture and add to its strength, is so slight as to be of no importance. This assumes that ties and timbers are properly treated and not injured by steaming or excessive heat during treatment. The drier that wood is kept, in ties and timbers, the stronger and better service they render.

The very great value derived from the treatment of wood is not only the prevention of the rot which makes the wood useless. The treatment maintains the original strength of the timber, especially in the case of ties treated with oil, and causes it to resist mechanical abrasion and wear longer. Furthermore, when ties are properly seasoned before treatment and preserved with creosote oil, the oil resists moisture and prevents the ties from becoming soft and spongy.

The added life due to creosoting depends upon the quality of treatment, and upon the kind of timber and the manner in which it is used. It is only fair to say, however, that creosoted ties will last from three to five times as long as untreated ties, while the cost of treatment does not double the cost of the tie. Therefore the great saving in the use of treated instead of untreated ties is apparent. This saving is even more pronounced in the case of other timbers.

Protecting Forests by Publicity

Good Results Secured by Canadian Forestry Association in Fire Prevention

By Robson Black

The use of publicity in the building up of forest protection sentiment has been employed only to the minimum degree by the lumbermen of Canada. Inspired by the excellent results achieved by the Western Forestry and Conservation Association of the United States, the British Columbia Forest Service and some commercial firms have gripped the idea and set it to work. So satisfactory and promising have been the results of popular education in forest guarding as to justify an extension to every forested province of the Dominion. Quebec, particularly within the zone of the co-operative associations, has accomplished something in the distribution of educative literature, and the carrying out of a personal propaganda by the precept and example of the fire rangers.

The adherence of all wideawake lumbermen to the needs of vigorous mutual and governmental action in the cause of forest protection against fire is growing at an amazing rate. Limit holders who a few years ago shook their heads at the thought of employing any protective devices other than natural rainfalls, have quit their old-fashioned position and lined up with the "moderns." The first experimental years of the St. Maurice and Lower Ottawa co-operative associations in Quebec have helped greatly in a general conversion. Actual saving of timber has become an accomplished fact. Old time losses have been cut to fractions. Statistical proof has been produced not only in Quebec and British Columbia, but from many parts of the United States, where brains have been given a chance to demonstrate the folly of tolerating wholesale fire damage in timber areas. No longer need the progressive lumberman point to results accomplished in Europe; he has results at his own door. No longer have the provincial and federal administations the excuse that forest fires are a necessary evil, pecularly associated with the Canadian timberlands. Facts have shown this to be false ground, and have also shown that whenever any of our government forest departments care to institute genuine forest protection, they need not step beyond the borders of the Dominion to find how it should be done.

Forest Fire Causes

The immediate causes of forest fires differ somewhat with the locality. Settlers' clearing operations cause enormous losses in one district, and in another the sportsman, river-driver, prospector, may equally share the onus of damage. Nearly always, however, human hands and human heads must bear the responsibility.

Laws that promise punishment will do much in curbing some classes of incendiarists, but it must be remembered that nearly all forest fires are, in the main sense, accidental. Few settlers deliberately burn the timber of the limit holder, although their carelessness is almost as guilty. Few campers deliberately desire to destroy the haunts of a thousand other campers; so it is with the river-driver, the prospector and the others.

This lack of deliberateness in the setting of dangerous fires in forest areas supplies the reason why all who have standing timber exposed to risk, or who have the more remote interest of a lumber yard, or a furniture factory, should get acquainted with, and stand behind, any organized Canadian effort to fight forest fires by education. The goodwill of an informed public is worth all the forest laws ever written.

"This is not conjecture," said the National Conservation Congress at Washington, D. C. "Progress differs locally almost exactly

with the degree in which propaganda has been successful."

The limit holders of the Western States agree with such a pronouncement; they back it up to the tune of from $200,000 to $300,000 a year in educational work. There is not more than a trifling fraction of such an amount spent on educative work by the lumbermen of Canada, outside of the two co-operative associations in Quebec, but the plentiful indications of an awakening to the needs of the situation are most encouraging.

The Publicity Campaign

The work of bringing the masses of the Canadian people into intimate touch with the forests and forest industries of the country is mainly in the hands of the Canadian Forestry Association, which has its headquarters at Ottawa. Without any governmental or other affiliation, this association, composed of public spirited Canadian citizens to the number of over 3,700, has waged a campaign for seventeen years. The hard labor expended in the long discouraging period when conservation was a dictionary term is bearing fruit. Even in the past two years of war, heavy additions to the membership and a wide extension of the association's activities have been carried out.

Three-fourths of the day-to-day energies of the association are expended on forest fire prevention through winning public co-operation. Experience in the United States, and to a considerable extent in British Columbia and Quebec, has plainly proved that skilful and persistent education must travel hand in hand with lookout towers, trails, telephone lines and rangers. How the educative portion of the work is carried out by the Canadian Forestry Association may be briefly indicated.

Practically all newspapers in Canada, daily, weekly, commercial, religious, etc., give the association the fullest assistance in spreading information about the importance of the wood-using industries and the need of guarding their supplies. Hundreds of articles, many illustrated, are prepared and placed. Newspaper cartoons, putting a sermon in a nutshell, are placed with about three hundred papers three times a month. Co-operation is also given to public and private agencies in getting important news to the newspapers and magazines, such as prosecutions of settlers, changes in regulations, etc.

Illustrated lectures, under the auspices of public societies are given in many parts of Canada. Motion picture theatres are freely utilized to show special fire cartoons between the reels. "Ready-prepared" lantern lectures are sent to ministers, teachers, etc., who have facilities for gathering audiences.

Enlisting Local Co-operation

One of the most fruitful activities in which the Canadian Forestry Association is engaged is the encouragement of Boards of Trade, municipal councils, clubs and societies to take an interest in the forest conditions of their localities and to bring pressure to bear upon provincial and federal authorities for needed reforms in administration or in laws.

The influence of the printed word was never so definite and real as it is today. The association makes use of print and illustration to an extent limited only by its finances. During the past seven months, ten thousand copies of "The Boy Scout's Forest-Book" were placed in the hands of school boys and girls and their elders. Colored instructive pamphlets were issued in French and English to the extent of about thirty-five thousand. Twenty-five thousand copies of "A Matter of Opinion," a propagandist novelty of 24 pages, and fifteen thousand copies of "Your Enemy's Photograph" in two languages, have gone through the country. The banks, railways, forest departments, and private corporations undertake to give all these issues very careful distribution to settlers, railwaymen, river drivers, campers, etc., etc., from coast to coast. The association also maintains "The Canadian Forestry Journal," which has been found of marked value educationally. The foregoing are some of the more tangible concerns to which the attention and revenues of the association are directed.

It will be noted that in no department of its work is the association taking up cudgels for anything but the most practical and proved methods of forest preservation through the sure channel of education.

Co-operation Between Manufacturing and Sales Departments

By George C. Robson

If we should ask the average manufacturer if his sales and manufacturing departments were co-operating, we believe he would answer, "We think so"; but ask the average sales manager or mill superintendent this same question and the answer undoubtedly would be, "Not as much as they should."

If any two departments in any business should work together to produce results, it is the sales and manufacturing deparements and in many ways this applies more to the lumber business to-day than ever before and more so than in many other lines of business.

The sales manager does not believe there is an intentional lack of co-operation between these departments, but rather a lack of understanding or knowledge of the other department's operations.

How many sales managers to-day have a proper knowledge of the manufacturing end of the business; but how many of the men directly responsible for the proper manufacture of lumber have any knowledge of the work of the sales department or the respective values of the different grades or kinds of lumber they produce and how it is sold on the market?

In the days gone by, when practically all lumber was sold as log run, it did not matter so much to the sales manager or the mill department if a few thousand feet, more or less, were lowered in grade by not being properly manufactured, for was it not true that it all brought the same price?

The manufacturer, who expects quality produced, must realize that to some extent it will affect quantity, but he should figure out for himself whether quality or quantity is the best paying proposition. Before he can perfect a manufacturing organization that will produce both, he must educate them and let them know something of what it means to him to get both results.

The soft wood problems, in both the manufacturing and sales departments, are on a much higher scale of efficiency than are the hardwoods and for this reason the hardwood question will be considered more seriously than the soft woods.

Is there a manufacturer to-day who is satisfied that his mill department is producing the maximum amount of better grades in the hardwoods, or is satisfied that he is getting the full money value in lumber from the sawing of his logs?

Is there one who is thoroughly satisfied with the present manner in which he markets his hardwood products? There is, of course, a remedy and we believe this remedy is in the hands of the employer fully as much as or more than in the sales or manufacturing departments; and when the remedy is found, these departments must co-operate to work it out.

Manufacturing and Sales Departments

We urge that the sales and manufacturing departments each study the problems of the other; that the sales managers familiarize themselves with the market's requirements so they can intelligently advise the manufacturing department, and when the mill department understands some of the principal essentials of the sales department, it will produce the quality that will enable the sales department to make a much better showing.

We believe each manufacturer could well take his mill superintendent, head sawyer, edger man, and trimmer man, yard foreman, and graders into his confidence to the extent of possibly holding meetings frequently, talking over the various subjects in connection with the proper manufactuirng of lumber, advise them of the respective values of the different grades, make a study of the grading rules and impress on them the necessity of their becoming students of the manufacturing game; and in this way the manufacturer, his sales managers and employees will find much enlightenment and more interest in the manufacture of lumber.

The up-to-date manufacturer of to-day is endeavoring to manufacture his lumber with the expectation of shipping it to meet the requirements of the market; and in determining how he will manufacture his timber, he must first consider the quality of his logs. If his logs are of good size and quality, he can well consider the sawing of some thick material, but unless he has a good quality, he should

A Creditable Issue

Editor Canada Lumberman:— Owen Sound, Ont., May 24.

Your Annual Number is indeed very creditable. The reading matter is well "put up" and the statistics are informative. The advertisements are well illustrated.

The publication brings home with force to the reader the great importance of the lumber manufacturing industry of the country.

Yours very truly,
W. J. Beattie.

A Fine Piece of Work

Editor Canada Lumberman:— Batiscan Station, P.Q., May 25.

I think the Annual Number of the Canada Lumberman surpasses any of your former issues. It is certainly a fine piece of work and all your articles are interesting and practical.

Yours very truly,
Maurice Walsh.

think of the results on the balance of his stock before he attempts to saw much thick lumber.

After it has been definitely determined as to the thickness of lumber to be sawn, the sales department is entitled to and should insist that the lumber be as well manufactured as is possible and practicable and endeavor to see that the logs are sawn to the best advantage, that the lumber is properly trimmed and edged and the thicknesses are as uniform as it is possible to manufacture them.

Mis-manufactured lumber undoubtedly causes the sales department more trouble than any one thing it has to contend with, for it not only takes valuable time in straightening out complaints, but it is usually necessary to sell such an article for considerably below the market value.

Proper Sorting Advisable

Next to the proper manufacturing of lumber comes the importance of sorting the lumber to the best advantage in accordance with the manner in which it is to be sold.

Most of the manufacturers have already overcome sorting difficulties with reference to their soft woods, but the sorting of hardwoods for the market has been largely neglected by most of the mills, as a careful investigation shows that most of them still continue to pile their hardwoods No. 2 common and better.

We believe this, to a more or less extent, is necessary on account of the majority of the mills not having a sufficient amount of room on their sorting works to enable them to sort the many different kinds of wood they manufacture to advantage and as a result a very heavy additional expense results when the lumber is shipped, on account of so much extra sorting and handling in the yard.

A mill, well equipped, with sufficient sorting room, can, with practically no additional expense, sort its lumber so as to eliminate a large portion of the cost now chargeable to the loading of harwood lumber which, all know, is high in comparison with the loading cost of soft woods.

I believe you will bear me out in the statement that in the ordinary yard the cost for inspecting and loading hardwood lumber is on the average, considerably in excess of $1 a thousand where the lumber is piled No. 2 common and better, while a soft wood yard, where the lumber is sorted, can be handled for less than one-half of the cost of handling hardwood in the same yard.

Not only can you materially reduce the cost of loading your hardwoods by proper sorting at the mill, but you have the additional advantage of having your lumber sorted ready for the market, can give your trade what it requires promptly, and without the necessity of the additional heavy expense of sorting and stacking down in an attempt to get out any particular grade; and you likewise will eliminate the depreciation that results from stacking lumber for any length of time.

We do not suggest that this sorting at the mill be done to excess, but we do believe that every mill can do a much better job of sorting than is being done at the present time and we likewise believe that every manufacturer who is producing hardwoods can well give serious consideration to his present sorting capacity and the manner in which he separates and piles his lumber.

Piling an Essential Factor

The piling of lumber is fully as essential as proper manufacturing. The foundations for pile bottoms should be made solid, with good pitch and well up from the ground to allow a free circulation of air under the piles. In piling the lumber, plenty of pitch from the bottom to the top of the pile should be allowed and proper chimneys of good widths should be placed in the centre of the pile to allow circulation of air from the bottom to the top of the pile. Narrow crossing strips should always be used, especially in hardwoods, and care should be used to see that these crossings are placed directly above the foundation timbers. This will eliminate a great deal of warped and crooked lumber caused by improper piling.

In the piling of better grades, it has been found very profitable to use 4-inch hemlock strips, either green or dry, to help eliminate the chances of discoloration. Stain undoubtedly causes the lowering of grades in lumber more than any other feature in connection with air-drying stock, and great care should be used to see that lumber is piled to avoid this feature.

Different kinds of lumber require different spacing to dry properly and to the best advantage, while the season of the year in which it is sawed makes considerable difference in the amount of spacing that is used.

Lumber should be properly roofed with plenty of extra pitch as soon as the pile is completed. If it is piled 12-foot and shorter together, the same should be covered with 16-foot lumber of as wide widths as can be obtained conveniently, while 14 and 16-foot piles or 16-foot square piles should be covered with a double length roof; and in either event the roof should extend at least 18 inches over the front of the pile and 2½ feet over the back of the pile. Care should be used to see that the cracks in the bottom course of roofing are well battened with boards 6 inches or wider, as it is a mistake to use 4-inch strips for roofing purposes.

Each pile cover should have three crossing strips on the top, securely tied down at the ends with twine to hold the roofing in place against winds, which would otherwise disturb them.

If proper pitch is not allowed in the pile bottom, it should be made in piling. Good lumber should not be used for risers in making this pitch, as the lumber will stain and lower in grade, but rather use a low grade for this purpose, as well as for roofing beds.

Lumber that is piled as above, either 12-foot and shorter, together on three foundations, 10 feet from front to back, and 14 and 16-foot together, with three foundations, 14 feet from front to back, or in box piles on four foundations 4 feet apart, so all lengths will rest on a crossing and if piled with a pitch of 1 inch to the foot and carried forward in front in the process of piling at the rate of about 1½ inches to the foot, will stand the work of the elements without deterioration for a considerable length of time and will come from the pile free from crossing stains, serious checking and other defects caused by improper piling.

It has been found advisable in many places to cover all hardwood and pine lumber of the grade of No. 2 common and better with No. 3 and No. 4 common hardwood.

A little care used by the piling crew will result in this low grade lumber coming off the piles with very little depreciation, while if better grades are used for pile covers there is sure to be depreciation in value.

Plenty of space should be used between the piles and also behind the piles to allow a free air clearance throughout the yard.

The grading of lumber is a very important feature and as much of it should be done at the saw mill as is possible. If the manufacturing organization does its part properly and the same is properly graded before it leaves the saw mill, the work of the inspectors in the dry yard will be reduced to a minimum and the amount of outs to re-handle will be small.

This careful inspection and scoring at the saw mill will likewise insure a much better grading of dry lumber and the amount the inspectors can handle will increase materially.

The sales department can likewise handle its sales to better advantage on account of knowing approximately what it has to offer on the market and it can thereby take full advantage of the best markets in making its sales.

Should be Properly Loaded

The loading of lumber, while it may seem unimportant, and frequently is very carelessly done, is one of the important features with a sales department. Lumber should be properly loaded, with the ends and sides evenly piled, with short stock mixed with the longer lengths throughout the car rather than piled in the door or altogether in one portion of the car.

Planing mill work should always be done in a high class manner. Poor planing mill work is the cause of as much trouble in the sales department as poor grades. The planing mill foreman should see that his knives are kept in proper shape to do smooth, high class work and particularly to see that matching and similar work is done in such a way that it will fit properly for the purpose intended and present a high-class appearance. A few pieces of lumber improperly milled oftentimes cause serious complaint, while a little care and watchfulness at the planing mill will eliminate this trouble and save the manufacturer considerable loss, and give satisfaction to his customers.

Valuable Suggestions

In closing, I desire to make the following suggestion: that the sales department and the manufacturing end of the business get together in a spirit of co-operation, make a study of the efficiency in manufacturing and endeavour to have their product leave the saw mill manufactured in as near a perfect manner as is possible; and the manufacturing department should be taken into the confidence of the sales department so they will know more of values between the various grades of lumber.

I urge that the manufacturers endeavor to sort their lumber to better advantage at the saw mill; that much more care be used in the proper piling and roofing and that the shipping department and planing mill department use more care in the loading and millworking.

I particularly urge that the sales manager use more care in endeavoring to dispose of the stock in the manner best suited to fit the stock he has to offer and in accordance with the manner in which it is piled.

On May 23rd a brief strike occurred at Ottawa when 40 or 50 river drivers on the log booms for various companies demanded more pay. The men were getting $2.25 per day and wanted $2.50. The companies refused this and the men quit work. The lumber companies then offered a compromise of a 10c. increase, but the men would not accept this and held out for the full $2.50. Finally this was granted and the men returned to work.

Good Food Helps Loggers' Output

Efficient Cooking Produces Better Meals at Lower Cost—Good Advice from a Practical Man.

"Cook-House Efficiency" is a subject which comes up for discussion frequently in connection with successful logging operation. For this reason, and because of the comparative scarcity of anything in the way of a written discussion of the subject, we are glad to be able to reproduce from "The Timberman" an article contributed by E. Hoyer, cook for the C. H. Wheeler camp at Timber, Oregon. Mr. Hoyer's article is as follows:—

This subject has been under much discussion in the last few years, especially on account of the greatly increased cost of living. I have had lots of experience as a logging camp cook, and I have devoted most of my time to the study of efficiency and economy, and I will try, to the best of my ability, to explain my views.

I know many camps a few years ago used to think they got off reasonably well with two pounds of fresh meat a day per man, besides the salted and cured meats. Today those same firms have cut down the cooks' allowances to one and one-half pounds, as the high prices are constantly driving them to economize, if they are to break even.

From personal experience I know that the best results can be had with one pound of meat a day. This may sound small to some, but it can be done easily. However, it requires study and real figuring, and the highest point of efficiency everywhere. There are a hundred little things, each of which helps. Many little streams make a big river, but each must have its supply of water or the river will go dry.

The companies are forcing themselves to economize more every day by force of necessity. Still there has been nothing done to educate them to the occasion or give them more practical knowledge than they ever had, and the matter of a course at college for this class of work is almost out of the question, and not to be considered anyway at this time, and cooking schools are of no practical use for this kind of work.

The main item of cost in the boarding house is the meat. If the cost of fresh beef by the side is 12½ cents (the average price today) by the time it is cooked, the bones and other waste eliminated, it is actually worth 25 cents a pound, so anyone will realize that it is an item worthy of the greatest consideration, and to see to it that the men have all they want and have it nicely and appetizingly put up, and still use as little as possible, is a very big problem to solve.

It must be remembered that these men work hard in the fresh air, and naturally develop a good appetite, and to get a man's goodwill (a most priceless asset), feed him well when he is hungry, and also the better you feed him the better he feels, and the more work he will produce, and that is what you got him for in the first place.

One thing more which is probably not generally known: If you want your men satisfied to east less, load the table in front of them to capacity with nice things, and if you try and cut down on the grub it will act just the reverse.

From personal experience I know places I have worked where I could not feed the men as well as I would like, where the management would try to cut out all expensive things possible, and used the cheapest grade of everything. In the first place, the men would be dissatisfied, in the second place the cost of the meals is always considerably higher in these places than where I got plenty of everything and was able to satisfy the men.

It must be remembered there always is plenty of fresh meat, and if there is nothing else to eat they surely will eat more meat. Such things as soup, bread and potatoes should be given more attention than they get from a good many cooks. They are the less costly part of the meal, and the better they are the cheaper the meal.

I have heard many cooks say they don't care about soup; there are only a few who eat it anyway. That's just what's the matter. If you don't care, the soup is no good and nobody wants it. Just try for a short time and do the best you can on it, and it will be appreciated by fifty per cent. of the boarders, and the only cost of soup is vegetables, as you always have the bones anyway.

If any of my colleagues should read this article, I will ask a question they can answer fair to their own judgment: Do you remember, for instance, some Thanksgiving you were worried because you were afraid you were not going to have enough turkey? You were sure they were going to eat an awful lot, and you decided to do the best you could. You filled the platters as well as you could—and do you remember how you had quite a lot left, and do you know why? If you do or do not I will tell you.

If you overload a plate in front of a gentleman of leisure and a poor appetite, it will make him sick and he can't eat at all, but if you fill the plate in front of a lumberjack who has a good fresh-air appetite, it doesn't make him sick, but it gives him a feeling of confidence and satisfaction. He knows your intentions are real, and it seems then like a little will satisfy him.

On the other hand, if you want him to eat all the hash, in the first place use nothing but fresh and clean stuff for it, and have it well seasoned, and see that you yourself, your help and the place where you work looks neat and clean at all times; it always gives the men confidence. Then be sure to put just a little hash on each platter and have it refilled as often as it is empty, and you will get rid of more hash than you ever thought possible.

Of course, when I say to fill the table in front of the men to capacity, it must be understood that the cook must be able to put it up in such a manner that what is left over can be used again and be as good as it was in the first place. You cannot afford to lose anything if you are going to get the cost down to my proportions, and any cook who cannot do this needs some more learning or he will be a hopeless failure in any boarding house.

Now, some of these things may sound foolish to some, and small and even insulting, but they are facts and part of the real art of efficient boarding house management.

Efficiency is necessary. It must come, therefore it is the only real solution of the problem.

Only a few years ago most camps were charging $4.50 a week for board, but the cost of everything increased to such an extent that they kept raising, and many of them are now charging $6, and still they can't break even.

The manager of a well-known logging company in Oregon told me last spring in a private interview that they had two camps, each of 100 men or more. I know he hires the best cooks he can find, and pays top wages. He furnishes anything reasonable that is asked. They raised the board to $6 and are still running behind each month, and these camps are close to the railroad. The cost of getting stuff in there is small compared with many camps that have a long haul by team, over bad roads.

Several managers have told me, "We are paying some of our men as little as $2 a day, and these men just can't afford to pay $6 for board, but neither can we afford to run behind."

The trouble with most of the companies is, if they do hire a boarding house manager or camp manager—or whatever you prefer to call him; I would call him efficiency man—it is mostly either a man with money, influence, or a young fellow with a college education who just has to have a start somewhere. It is hardly ever an experienced camp cook, with up-to-date ideas, and will and gumption to back them up, and only such a man would be able to do things. He would be able to hire cooks and helpers who will take his ideas and work hand in hand with him, a thing absolutely necessary for success. It would also inspire the better class of men with new ambition—that of becoming efficiency men themselves.

I suppose this line of talk will meet with disapproval from some of my readers. If so, I am sorry, but I must admit that I don't expect to please everybody, but it is my aim to state facts as I see them. The world is getting bigger and greater every day, and there is, by reason of progress, a constant demand for bigger men to do bigger things than was ever done before.

Surely none expect a cook or any other kind of man to be satisfied with earning an average salary of $100 per month. Any man who is satisfied with that has no ambition, and a man without ambition is no good. Lots of fellows are not satisfied, but they know they can't go any farther, simply stay in the business long enough to get money to go into something else, and those are the fellows we cannot afford to lose.

Of course, my ideas of efficiency are not to bring a man up to your camps to show you where you ought to put up an electric plant and cold storage, and a $200 machine to wash the dishes, and dido to peel the spuds, and still keep the same men on the same jobs to run the respective electric machines. These things are awfully nice to have, but unless you know just when they are going to pay for themselves, and how much money they are going to save you afterward, you do not want them. Remember, experiment is closely related to failure, and is your best friend.

In most logging camps such things are out of the question altogether. In mills where they develop their own electric power, it is and can be used effectively for some things. Of course, conditions are so very different in each place that each has to work out his own problems to get the highest point of efficiency.

I took a fry cook job in a large boarding house in Idaho once. I went there more out of curiosity than anything else. I had heard of

the place for several years, as well as its manager, and thought it was an ideal place of efficiency, as I am always wanting to see the work of someone I think knows more than I do, and I felt very fortunate to have the opportunity of working there.

But how utterly surprised I was when I saw the system—or rather lack of system—they had of doing things. I will say here that in all the time I was there the chef and I did not have one cross word between us, and when I left we parted on the best of terms. But to express my feelings in words, I will admit that if I had charge of a boarding house I would not give such a man a job of any kind. He had one good quality I know of: he was always on the job. Of course, the manager knew, but I guess what he liked particularly was that he did not know any more than the manager.

The place itself was modern in every respect. They were boarding, and had rooms for about 320 people, but the management was about 15 years behind the times. The manager never was a cook himself. He got the position and held it on the strength of being absolutely trustworthy and having been with the company for many years.

I made up my mind when I went to work there to keep my eyes and ears open and my mouth shut, but anyone knows occasions will arise when it is hard to keep your mouth shut, when you know you can put somebody on the right track.

Once they had a lot of complaints about the pies. It was a mining boarding house, and to show their contempt, the men would take their pies out of their lunch baskets and throw them in a pile at the entrance to the mine, a very annoying thing for the manager. He spoke to me abount the matter, and I told him to tell the baker to save the juice of the fruit, boil it with a little starch, and he had no more trouble after that; the bottom paste would be deliciously done. Before this the baker used to strain away and waste all the juice—about fifty per cent. of the contents of the can; and pies made without boiling the fruit, are bound to be soggy and bad.

The manager told me afterward it made a saving of 15 gallon cans of fruit a day—over $5, or $150 a month—quite a saving. And this one item alone would make quite a salary for an experienced man to stop many such leakages, and the item alone proves my theory that economy and efficiency will nearly always improve the quality. If it doesn't, I wouldn't suggest the saving.

Another time we had quite a discussion about coffee. The manager was getting coffee at a local store at 28 cents a pound, so I left word for a coffee salesman to call, and he sold him a better grade of coffee at 23 cents, a saving of 5 cents a pound. They were using lots of coffee, putting up 300 lunch buckets a day, using 18 pounds of coffee, a day, a saving of 90 cents, or $27 a month.

The manager was constantly complaining about too much meat coming back on the plates, and the chef and the meat cutter had lots of trouble over it. Neither knew the cause nor the remedy, but each one rubbing it into the other to get him fired to his own and the manager's satisfaction. At this stage of the game the manager was still treating me nice, but quite below zero for making too many suggestions, and knowing this I declined to interfere. I suppose he considered me a menace to his own position; quite unjustified, as I was only trying to assist him in any way I felt I was able.

The dishwashers would save the meat scrap in a big pan and send them to the company's farm for chicken feed. Finally the chef in despair would empty the whole pan of scraps in the stock boiler (a pot in which bones are boiled, from which soup is made), not because he wanted it, as there always was plenty of fresh bones, but just to hide it from the eyes of the manager.

This is an unjustified, filthy thing to do, and anyone practicing it should be prosecuted and forever banished from the kitchen. I very much disapproved of it and told him so, and he finally stopped doing it for fear I would make a complaint about it.

When a butcher in a city shop cuts his T-bone steaks, it's a matter of business with him to leave as big tails on them as possible, as the tails are part of the flank that sells for 11 cents a pound, when he gets 25 cents for it if it is on the steaks. For the same reason he does not trim any more fat off of any of his cuts than he can get away with. He prefers to sell the fat at beef prices.

And when a man goes into a restaurant and orders a good steak, if the tail is not there he would kick. Not that he wants it to eat, but he is paying for it and he feels he wants to see it and leave it on his plate. For the same reason he wouldn't accept his broiled fish unless the head was there.

But when it comes to a boarding house, it is a different matter. A man pays so much for his meals, and he is supposed to have all he wants to eat. Why not trim the steaks and just serve a man the parts he wants to eat? The boarder will be better satisfied, and you would save more in this way in a week than you will making hash a whole month.

I hate to rob a man of his personal liberties, but I am a radical economist, and I believe in years to come, unless science changes our mode of eating altogether, the ideas of the people will advance to such an extent that it will be a punishable crime for anyone to go to a restaurant and order a steak two or three times as large as he knows he wants to eat, when maybe two blocks away there are people who would be glad to get a soup bone, if they could only afford it.

I could continue with a hundred examples of this sort, but my article is already getting far bigger than I intended, and I don't want my readers to think I am trying to write a cook book.

If I ever get the time to write another article on this subject, I shall explain how to eliminate waste almost entirely by up-to-date methods. Every part of the meat, even to the skin of a pig, can be used effectively. Many things are wasted in the camps by neglect and incompetence, which could be made into exactly the same things bought at groceries at fancy prices, with very little additional effort.

There are lots of good cooks working in the Pacific Northwest; if they were co-operated with a little and given more opportunity, you would be surprised at the results. Any company employing 200 or more men can afford, and should keep, an efficient manager of the boarding house, with no other duties, and he will earn his salary many times over. Some firms have been trying this out and have found it very effective.

The average working man is willing to pay the price for a good meal and the getting of it, but he hates to pay for something he does not get. The thing has been argued up and down, but I know in many cases where he pays the biggest price he is losing out by reason of inefficient management.

Exports and Imports of Wood Products

Canada's imports of wood and manufactures of wood for twelve months ending February, were valued as follows: 1916, $8,477,118; 1915, $15,656,974. Of the 1916 total the imports from the United States were valued at $8,040,895, and those from the United Kingdom at $111,395. Exports of forest products during the twelve months ending March, were valued as follows: 1916. $51,271,400; 1915, $42,650,683; 1914, $42,792,137.

Details of exports of wood and manufactures of wood during the 12 months ending February, were as follows:—

Articles Exported	1915	Total	To United Kingdom	To United States
		1916	1916	1916
Logs	$ 994,086	$ 1,285,835	$ 49,359	$ 1,236,136
Lumber—Deals, pine ..	1,151,310	1,248,605	1,168,696	49,539
Spruce and other	6,254,057	9,799,752	8,951,971	263,907
Lath, palings & pickets	1,840,929	2,507,461	11,268	2,481,396
Planks and boards	18,678,854	23,520,759	2,129,073	19,727,097

Alex. Macdonald, Pembroke, Ont., one of the best known men in the lumber business in Pembroke, died suddenly of heart failure on May 10th.

Better Conditions in B.C. Industry

Editor Canada Lumberman:— Vancouver, B.C.

The lumber situation this spring in British Columbia shows an immense improvement over this time last year, chiefly through the heavy demand from the prairie provinces. There is also a good demand for our products in Ontario and Quebec. The shingle branch of the business is especially active at good prices, and, with the increasing cost of metals and the raw materials for patent roofing, shingles will likely be in still greater demand.

Another feature of the situation is the good volume of lumber being shipped from this province to the United States, which is a much better situation than that prevailing in past years, where western Canada imported heavily from across the line.—Timms, Phillips & Company, Limited.

Equal to the Best

Editor Canada Lumberman:— Chatham, Ont., May 23.

The Annual Number of the Canada Lumberman, which I have just received, is a credit to you, both in its mechanical features and in the very interesting articles that you have published.

I think that the letter press and cuts are fully equal to those of any trade papers that we receive, either from the United Kingdom, or from the United States, and the paper should be a very valuable one to those interested in the lumber business, either as manufacturers or consumers.

Yours very truly,

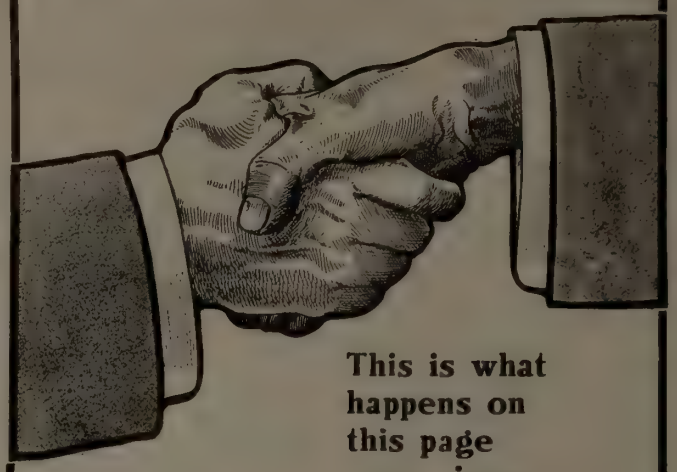
J. Innes,

"The Sutherland, Innes Co., Ltd."

The Master of Ceremonies

Mr. Buyer

Are you in the market for a special bill of lumber? Would you like to pick up a real good second-hand planer or perhaps some logging equipment? Have you a vacancy in your plant for a filer or other employee? If you answer "Yes" to any of these, advertise on this page. It is the "Master of Ceremonies" and will introduce you to the man you want.



This is what happens on this page every issue

Mr. Seller

You are looking for the man who is looking for you—you have for sale what he wants. All that is needed is an "Ad" on this page to bring you together. Appeal to this "Master of Ceremonies" and send us a small ad. today. What can we sell for you—or perhaps we can find you a job.

Send along your ad.

WANTED & FOR SALE DEPARTMENT

PUBLISHER'S NOTICE

Advertisements other than "Employment Wanted" or "Employees Wanted" will be inserted in this department at the rate of 15 cents per agate line (14 agate lines make one inch.) ($2.10 per inch. each insertion, payable in advance. Space measured from rule to rule. When four or more consecutive insertions of the same advertisement are ordered a discount of 25 per cent. will be allowed.

Advertisements of "Wanted Employment" will be inserted at the rate of one cent a word, net. Cash must accompany order. If Canada Lumberman box number is used, enclose ten cents extra for postage in forwarding replies. Minimum charge 25 cents.

Advertisements of "Wanted Employees" will be inserted at the rate of two cents a word, net. Cash must accompany the order. Minimum charge 50 cents.

Advertisements must be received not later than the 10th and 26th of each month to insure insertion in the subsequent issue.

Wanted–Lumber

Maple and Hickory

Wanted, Maple and Hickory Axles, dry. Jackson Wagon Co., St. George, Ont. 8-11

Basswood Wanted

No. 2 Common and Mill Cull. Winter cut preferred. Apply Firstbrook Brothers, Ltd., Toronto, Ont. 8-t.f.

Wanted to Buy

750,000 ft. 2 in., 2½ in., 3 in. and 4 in. log run Birch. Terms 75 per cent. cash on shipment, balance on arrival. Apply P. O. Box 643, Montreal, Que. 9-12

For Sale–Lumber

For Sale

One hundred thousand feet of 4/4 Basswood, Ash and Elm crating lumber. S. L. Purdy, Coe Hill, Ont. 11-12

For Sale

30 cars Winter Cut Basswood Logs, 6 to 16 ft. long, largely 12 ft., 10 in. diameter and up. Box 200, Canada Lumberman, 119 Board of Trade, Montreal, Que. 11-11

For Sale

10 cars Short Basswood Logs, 4 ft. long, 8 in. to 20 in. diameter, winter cut; practically no black heart. Rail or water shipment. Box 100, Canada Lumberman, 119 Board of Trade, Montreal, Que. 11-11

For Sale

500,000 Western Ontario White Pine Logs. Can be sawn to your order. Those interested please write Hall Brothers, 174 Mutual St., Toronto, Ont. 9-12

Slabs and Edgings

Wanted a buyer for the slabs and edgings from our saw mill cutting 25 M. feet B. M. per day, Maple and Birch, also Ashes from our boilers. Additional supplies of hardwood can be purchased in the vicinity. Reply to Box 410, Canada Lumberman, Toronto, Ont. 11-12

Lumber For Sale

200 Pieces 1 x 15 and up 22 ft. Cypress.
375 Pieces 1 x 15 and up 24 ft. Cypress.
Clear for boat building, in stock at Montreal.

GEO. C. GOODFELLOW,
e Montreal, Que.

For Sale–Machinery

Machine For Sale

Two second-hand McGregor-Gourlay Q. Y. Planers and Matchers, one 9-in., one 15-in. wide; in good condition, ran every day till October, when fast feed Matcher was installed. Located in Saskatchewan. Box 384, Canada Lumberman, Toronto, Ont. 8-11

Machinery for Sale

Complete Sawmill Outfit; One Hundred and Twenty-five H.P.; Single Circular; Steam Feed; Nigger Log Turn; Live Rolls; Four Saw Edger; Dutch Oven; Perkins Shingle Rig, including Cut-off and Jointer. Everything in first-class condition. Building also if desired.

McCAMUS & McKELVIE,
11-11 New Liskeard, Ont.

Machinery for Sale

Second-hand saw mill engine, Corliss type, in perfect condition. A snap for quick sale. Box 400, Canada Lumberman, Toronto, Ont. 10-11

Timber Limits and Mills

Timber limits for sale in the District of Algoma, also a Band and Gang Saw Mill. For particulars apply to Geo. Niebergall & Son, Parry Sound, Ont. 11-13

Machinery For Sale

A small "Ad" under this heading, telling of what machinery you have for sale, will immediately put you in touch with buyers. Send us a list of machinery items and we will quote you on a small "Ad." Send the list now, before you forget about it. 1-t.f.

FOR SALE

Woodworking Machinery

The following second-hand machines have been placed with us for sale:
1 Woods No. 32 Matcher; 1 Goldie 10-in. Moulder; 1 Goldie 24-in. Matcher; 1 Cowan 42-in. Sander; 1 Jackson Cochrane 36-in. Sander; 1 Egan 36-in. Single Surfacer; 1 McGregor Gourlay 2-drum 30-in. Boss Sander; 1 Egan 30-in. 2-drum Sander; 1 CMC 8-in. 4-side Sticker.

P. B. Yates Machine Company, Limited,
10-t.f. Hamilton, Ont.

Machinery For Sale

Refuse Burner, 24 ft. diam. 100 ft. to spark arrester; all grate bars. 4 base doors, lined with fire brick; in good condition.

Smoke stack 7 ft. x 130 ft. to spark arrester, a1 condition.

Three Boilers, 6 ft. x 16 ft.; 70 4-in. tubes, 2 fire doors, 2 draft doors, fronts in a1 condition.

One No. 8 Buffalo Forge Co. Blower.

One Dean Duplex Steam Pump; 2—14 x 14 steam end; 2—12 x 28 water end, valves and piping.

All angle iron frames and galvanized roofing for large fire room.

All or any part at bargain prices.

Box 390, Canada Lumberman, Toronto, Ont. 10-12

Wanted–Machinery

Lorries Wanted

Fifteen second-hand lumber lorries, must be in good condition. Campbell MacLaurin Lumber Company, Limited, Drummondville, Que. 11-14

Wanted–Employees

Advertisements under this heading two cents a word per insertion. Minimum charge 50 cents.

INSPECTOR WANTED—A man capable of inspecting both hardwood and softwood, and shipping same. State references, experience and salary expected. Box 394, Canada Lumberman, Toronto, Ont. 9-12

BOOK-KEEPER WANTED to act as Secretary-Treasurer of a Lumber Company with $100,000 invested; in first-class condition and operating. Applicant must be willing to invest $5,000 or $10,000 in the capital stock of the Company. A young man preferred, who is not eligible for active service, and one who has some knowledge of the lumber business. Must have good record. Apply to Box 406, Canada Lumberman, Toronto, Ont. 11-12

Wanted–Employment

BAND OR CIRCULAR FILER or Mill Foreman wants position. Twenty-seven (27) years' sawmill experience. Gilt edge references. Box 405, Canada Lumberman, Toronto, Ont. 11-11

EXPERIENCED LUMBERMAN wants position. At present employed as sales manager. Can furnish A1 references. Reason for change, company going out of business. Box 401, Canada Lumberman, Toronto, Ont. 10-11

DOUBLE BAND SAW FILER wants position, first-class references.

BAND MILL FOREMAN wants position, first-class millwright, and can handle men to good advantage. Box 359, Canada Lumberman, Toronto, Ont. 6-11

Business Chances

For Sale

To close an Estate, the valuable Lumber Mill known as the Picnic Island Mill at Little Current, Ont., Georgian Bay, is offered for sale. Capacity about twenty million feet of lumber per season. Extensive docks with sixteen feet of water and booming capacity for about fifteen million feet of logs.

Picnic Island, which is freehold property, consists of thirty-seven acres, containing the mill and twenty dwelling houses for employees. Superior drying grounds. Can ship by rail or water. For further particulars write,

James Battle, Thorold, Ont.
Administrator Estate of Late John Conlon,
or
Thomas Conlon, 44 Church St.,
U-13 St. Catharines, Ont.

Business Opportunity

Make your opportunity knock at the door of every Lumberman in Canada by placing a small "Ad" about it in this column. Our rate is $2.10 per inch per issue. Now is a time when monied men are seeking good bargains. What have you to offer? 1-t.f.

Timber Rafts for Overseas

A novel method of getting needed timber and lumber overseas without using up shipping so urgently needed for other purposes, has been suggested by Captain A. G. Midford, Ottawa. His plan is to tow it across in the form of huge timber rafts and he states that from one to twenty million feet of timber can be taken over at once. His suggestion has received commendation both in Canada and in Great Britain and it is most probable that the suggestion may be productive of practical results.

The Timber Trades Journal refers to the suggestion as follows: "The difficulty of all nations, belligerent and neutral, is the scarcity of tonnage. Although this is in a great part due to the large number of mercantile ships engaged in carrying supplies for war purposes, so great must be the wastage that, notwithstanding the releasing of a large amount of tonnage at the close of hostilities and the continued building of new vessels, ships will be in greater demand after the war than now.

"The best way to economize in the matter of ships is to do without them altogether and though this is impossible, at least at present, for the transport of certain classes of goods from overseas, we are pleased to hear that as regards the transport of timber it is not only possible but likely to be brought about by sheer necessity. We have been favored with a copy of a letter received by the Timber Trade Federation from A. G. Midford, of Ottawa, a civil engineer, who has had a life of experience in executing marine work of magnitude and in solving maritime problems. He also holds a master's certificate and is well known throughout Canada, the United States and South America.

"Captain Midford's object is to construct a ship-shape raft of timber and lumber in such a manner as to provide against the incessant and usual strain to which any floating body or ship is exposed and must encounter in meeting the vicissitudes of a stormy sea. The ship-shaped raft is to be built entirely of mercantile and marketable lumber and timber, is in no sense watertight and therefore depends entirely upon buoyancy and not on displacement in the ordinary acceptance of the technical meaning. The ever-changing strain which must prevail is provided for, without which any floating body would go to pieces in a storm. The midship section is decidedly ellipsoid, the deck being turtle back for economic reasons readily apparent to the competent ship designer or marine architect who will give due consideration to the problem.

"Towing has been fully considered, including the cause and prevention of the snapping of the tow-line and the ship-raft will be steered from the after-deck of the towing vessel. Sea rafts of the type suggested may be made up entirely of marketable timber and lumber and no lumber need be cut or bored for constructive purposes. The entire outside layer could be composed of slabs which have no marketable value in Canada but would be useful in England.

"This is an outline of Captain Midford's project. If he can make it successful he will be doing a service to humanity, for the ships can thus be relieved of wood cargoes for more pressing services."

Promissory Notes in Wood

The lumber manufacturers of the United States have adopted a new motto for their plants. "Make Every Board a Promissory Note." This motto is the outgrowth of a new movement which is spreading with amazing rapidity to every lumber manufacturing district in the United States, in a national campaign to standardize lumber, to adopt specific grades for lumber, which will guarantee the quality of every piece of lumber put out by a saw mill, says a bulletin issued by the National Lumber Manufacturers' Association.

The devising of trade marks is going hand in hand with the new movement and is part of it. Nearly every lumber manufacturing organization in America today either has decided upon a trademark for lumber, or is considering such a movement.

The trademarking of lumber has developed through a demand by builders and architects in all parts of the country for some standard which would assure their clients that the character of a building under erection would be in accordance with specifications, and that the timbers would be equal to the heaviest demands upon them. When every board is a promissory note, an architect can specify the quality of lumber he wants in a building, and can know instantly from the trademark whether the lumber provided is that which he asked in his specifications.

If one keeps an eye on the material used now in the implement and other kindred lines, it will be noted that maple is used in place of ash for many purposes, and pecan takes the place of hickory. Red oak, after steaming, looks a good deal like white oak, and will probably last as long in many places, being usually worn out before it has a chance to rot out or break. "Things are seldom what they seem; skim milk masquerades as cream."

Review of Current Trade Conditions

Ontario

The retail lumber trade in Ontario is not showing much in the way of activity. Wholesalers report that enquiries from retail yards are not so plentiful as they were a few weeks ago. In Eastern Ontario, the trade has settled down to a very small volume and towns which were fairly active a few weeks ago are now very quiet. Brockville, for instance, was very busy for a while, but its local trade has now dwindled. In fact most of the centres in Eastern Ontario and many of those in the west report that there is very little stock moving. This is chiefly on account of the situation in which the farmers find themselves on account of the backward spring. Not having been able to get on his land anything like as early as usual, the farmer has been playing safe. The general situation with the farmer is somewhat doubtful, comparatively speaking, this year, and he is not now to be counted upon as a strong factor in creating a good demand. In a few of the centres of south-western Ontario trade is active, chiefly on account of the manufacturing demand, but even there it is spotty; that is to say, it will be good for a few days and then become quiet again. Hemlock continues quiet and the probability is that it will remain fairly steady because the production this year shows a considerable falling off.

The present indications of good weather are helping the general trade to some extent and are likely to bring out a fair amount of repair work throughout the country districts.

The hardwood trade in Ontario continues on an active and firm basis. There is a steady demand for the good end of hardwood stocks, but dry stocks are very scarce. A month ago, number three common stocks looked as though they might become a drag, but they have been moving well and now there is very little number three common left. Conditions generally are characterized by a scarcity of dry stocks, and purchasers are showing a little hesitation about purchasing new stocks. As a whole, the hardwood trade is good.

Eastern Canada

There has been a slight improvement in the local market at St. John, N.B., but the export trade both with the United Kingdom and the United States, is very quiet. Sales of deals, etc., for export are rare. Nearly all cuts of deals for this season, however, have been sold, what remains being a small quantity of portable mill stock which is rather difficult to dispose of. The tonnage scarcity at St. John continues with practically no sign of improvement. The American market is less firm than it was a fortnight ago. Schedule prices are at about $27 base. There is less demand also for spruce boards in the American market. A fairly good demand is reported for lath, but coastwise freights are very heavy and are eating up a big portion of the price. Shingles show a slight improvement and are about 10c. per M. better than they were a year ago, but freight rates in this case also are a serious matter. Spring drives on the St. John River have not made as good headway as was hoped for at first. The weather has been dry and water has fallen rapidly, so that a number of important operations and drives have been held up.

At Montreal there is also some improvement in the local trade, especially in the demand for hardwoods. Building activity is very light. There is a fair demand from the United States markets.

Reports from Boston indicate that prices of spruce are showing a slightly weaker tendency, as a result of increased production. The demand, however, continues on a fairly extensive scale. Some wholesalers are quoting $28 base on frames and some manufacturers have reduced their base price to $27.50 when selling through commission houses. Further concessions would be likely on anything in the way of large business. Random is moving more freely than formerly during the present year, some good orders having been placed lately, and more being in sight. The present quotations for random range about as follows: 2 x 3, 2 x 5, and 2 x 6. $21.50 to $22; 2 x 4, $22 to $22.50; 2 x 8, $25 to $26; 2 x 10, $26.50 to $27; 2 x 12, $27.50 to $28. The demand for spruce boards at Boston is growing more satisfactory all the time. The hemlock situation also is favorable, with a good demand and signs of further improvement as building operations increase. Prices are steady.

Improvement is reported in the demand for shingles at Boston and throughout the east. No good extra white cedars are offered at less than $3.50, and some brands are bringing $3.60. Clears are selling at $3.20 to $3.30. Red cedar shingles are also doing well, but there is a shortage of stocks. Some nice brands of extras have been bringing $4. There is a good demand for lath, but production has increased and prices are a little easier. For 1⅝ in. the quotation is from $4.15 to $4.25, and 1½ in. are bringing $3.90 to $4.00.

United States

Building operations in the United States continue to increase in practically all important centres. During April there was an increase of 16 per cent. in building permits in 71 cities. The reports received, moreover, indicate a strong tendency to return to wood construction. Throughout New England the building activity of the past few months continues unabated and includes many factories of mill construction.

In spite of improvement in the car supply situation, the freight embargo in the east has become more acute and is a great handicap to shippers who supply buyers in New England and on the Atlantic Coast. Embargoes have been placed on lumber shipments by several railroads, including the Pennsylvania, the New York, New Haven and Hartford, the New York Central, the Baltimore and Ohio, and the Erie railroads.

Better reports are being received from the southern pine districts and it is thought that the flurry that was looking rather serious a short time ago has passed by and that improvement is likely to develop. Some of the larger manufacturers have begun to curtail production. The improvement in the car supply has enabled mills to forward shipments in greater volume and thus to reduce the amount of stock on hand.

Encouraging reports continue to come from the Pacific Coast, where the situation is stronger than it has been at any time during the past two years. The advances recently made in fir are maintained and the market has an upward tendency. There is an active demand for all Pacific Coast woods. The only unsatisfactory feature of the trade is the scarcity of ocean transportation facilities. If there were vessels available to-day, Pacific coast mills which don an export trade could dispose of practically their full capacity at prices better than they have received for some years. The re-opening of the Panama Canal has not as yet been of any particular benefit to west coast mills, because of the scarcity of vessels. There is a good demand on the Atlantic coast for Pacific coast products, but extensive shipments cannot be made by water at present.

The hardwood trade is encouraging. Hardwoods are holding a commanding position in the trade. There has been a marked improvement in the demand for oak. Northern hardwoods continue to show exceptional activity, although some of the mills have been having more than their share of labor troubles of late. Hemlock manufacturers report an active demand, and stocks in shipping condition have been badly broken, so that shippers are finding difficulty in filling the requirements of the trade.

Northern pine trade continues about normal, with prices steady. The yard trade is not extensive, but there is a fair demand from large corporations in the important cities. Weather conditions have been rather against improvement in the country trade. At Buffalo, the demand for northern pine shows some improvement, though at times it is still quite spotty. This is a result of backward weather. Farmers generally are from two to three weeks behind in their spring work. There is no great demand at Buffalo for white pine, but the trade is better than it was a year ago.

Great Britain

In spite of the great increase in the value of wood resulting from advanced freight rates, the consumption on the spot market at London is still extensive. There is not much disposition, however, on the part of importers, to take an interest in forward business, as it is a very difficult matter to sell at a fair profit on anything except hand-to-mouth transactions. The requirements of the Government are somewhat less numerous than formerly and, although they may be expected to continue during the war to some extent, they will not keep the trade as busy as they have formerly. This year's import is likely to be moderate, because of the scarcity of vessels, cost of war risk, rates of exchange, and restrictions that have recently been imposed. Importers, therefore, are inclined to allow producers to hold their stocks until they can be transported to England at a cost which will not be so great a burden to the consumer. The stock now on hand at London is reported to be equal to about two months' consumption. The Board of Trade have given out an intimation that they will restrict the import of planed, tongued and grooved boards, and matchings. Stocks of these goods in London, however, are plentiful to keep the trade going, for a fair time.

At Foy, Morgan & Company's recent auction sale, 3 x 11, 8 to 19 ft., first second, and third red pine from St. John was sold at £28 15s. 3 x 9, 12 to 16 ft., third red pine from Montreal, brought £29. Unsorted Quebec spruce, 3 x 11 in., 11 and 12 ft., brought £29 5s. Fifth quality 3 x 9 Quebec spruce, 9 to 14 ft., sold at £26. A quan-

tity of 3 x 7 unsorted red pine from Montreal, 10 to 18 ft., brought £27 5s.

Imports of spruce into Liverpool during April showed a considerable decrease, and the consumption also fell off, according to the figures that have been compiled. F. o. b. and c. i. f. selling has been very quiet for Lower Ports spruce, but this quietness is expected to be only of a temporary nature, as future offerings can hardly be anything but light, and ready buyers are expected to be waiting for them. There have not been many fixtures of late, but rates apparently are still high, 375s. having been paid.

At Manchester the consumption of spruce is quite equal to that of a year ago and seems likely to continue. Prices are still firm and high. The hardwood trade at Liverpool continues quiet. There are a fair number of enquiries for special lines, but difficulties in making delivery are a handicap. Stocks of hardwoods are not large. The prohibition of certain hardwood imports is preventing stocks from increasing. There is practically no forward business in hardwoods at Liverpool. There is a fair enquiry at Manchester for hardwoods, especially for 2½ in. and 1½ in. planking in anything but oak. Maple flooring is in fair demand and stocks are limited. Birch is sought for in Quebec quality, but there is much difficulty in securing stocks at satisfactory prices.

Market Correspondence

SPECIAL REPORTS ON CONDITIONS AT HOME AND ABROAD

More Vessels Available at Montreal

Montreal, May 27.—(Special to The Canada Lumberman).—A small improvement is to be noted in local trade. With the building business still quiet, it is not to be expected that the sales should show any marked increase. The most active section is, relatively, hardwoods, where the demand is still brisk, with a scarcity of dimension descriptions.

There is an absence of notable building projects, if we except a scheme for constructing a union station and a tunnel under the St. Lawrence at a cost of 35 million dollars. This, however, is in quite a preliminary stage. It has yet to go before the Railway Commission, and the plans are only of a tentative character. The promoters are seeking public support, not of a financial character, and have many difficulties to overcome before the plan can be carried out.

Buying for the United States continues to be satisfactory. The embargo on the Williams Line continues at the time of writing, but there is a probability of its being raised shortly. The situation at Albany has improved greatly, the congestion of cars being gradually relieved.

Quite unexpectedly the Government have released several steamers, making a fair amount of tonnage available for the export lumber trade. In consequence, there has been a considerable increase in the lumber exported from Montreal and from Three Rivers. This is principally spruce, the demand for pine being rather slow. Rates are again higher, 400s. having been paid. A cheering item of news is contained in a cable from the other side announcing that the embargo on birch timber has been raised, and it is expected that the lifting of the prohibition on birch lumber will follow. The rates for shipping the timber are very stiff. As much as 600s. per standard has been paid, against a normal rate of 75s. The steamship companies have issued a good list of sailings, but this does not necessarily mean that much space will be at exporters' service, as the Government may commandeer boats at very short notice, and thus upset exporters' calculations.

Mail advices from England state that there is great confusion over the Government orders prohibiting, except under license, the importation of hardwoods and certain other commodities. The special committee dealing with this matter is inundated with letters and enquiries, and considerable uncertainty prevails as to the conditions under which imports are allowed. In one instance, lumber products were prohibited from landing, and in a few days the embargo was removed, causing great delay in the landing of these goods.

The sulphite market is in a buoyant condition, with prices still higher. Stocks in the United States are very low, the prospect being that little European pulp will be imported for some time. A large amount of Canadian pulp has just been shipped to the United Kingdom, where there is a scarcity. Mechanical pulp is also firmer, considerable stocks having been absorbed.

Deal Shipments from Parrsboro, N. S.

Parrsboro, N.S., May 25.—Owing to the remarkable scarcity of tonnage, the deal shipments from this port up to the present are much smaller than in other years. Only one schooner and one small steamer have yet sailed—the two carrying about two million feet. As a result of abnormal freight rates and scarcity of bottoms, an American schooner fifty-one years old, and of only 199 tons register, is now loading here. This is the smallest, as well as the oldest vessel that has ever loaded deals at this port for overseas. Another schooner, of larger dimensions and fewer years, has just finished loading, and two other schooners are partly loaded. One of the latter took four deal cargoes across last season. A large steamer under orders from the Imperial Government arrived here this week for a cargo of deals. She will take upwards of four million feet. Several other vessels are under charter to load here, and the prospects are that the deal business will be fairly brisk during the remainder of the season. Freight rates are ranging in the vicinity of four hundred shillings per standard, or about ten times the normal rate, and it is thought they have about reached the limit.

The demand for tonnage seems to increase with the efforts made to supply it, and will probably lead to the construction of more vessels than the builders originally intended. The shipbuilders in this vicinity can, if they wish, sell the vessels now under construction at prices that would afford a handsome profit on the estimated cost of building. For instance, one shipbuilder has been offered $50,000 for a vessel which he estimates will cost $35,000. No wonder the builders are looking for more frames.

Ten fine spars of Douglas fir arrived here last week from Seattle for G. M. Cochrane, of Port Greville. They are ninety feet long and from 22 to 24 inches in diameter. The freight bill was eleven hundred dollars. By the way, why do our builders have to go across the border to get the timber they require? Are there no big trees left in British Columbia?

E. Woodworth.

St. John Markets—Better Local Trade

St. John, N.B., May 26.—(Special to The Canada Lumberman).—During the past ten days the local market in the building trade has shown some improvement. While this is so, it cannot be said that the English and American export business has followed the same upward trend; in fact, very little business is being transacted and sales of deals, etc., are few and far between. Of course, practically all the cuts of deals for this season have been sold, therefore only a small quantity of portable mill stock remains to be marketed. Persons having such stock to offer are finding trouble to dispose of it, as the deal buyers do not seem disposed to load up with any more stock, claiming they can get no tonnage at any price, also that the risk is too great, the freights being so high—ten times over the usual price. Only a few firms in Great Britain are able to purchase and it is expected before long that conditions will show a great change. Therefore, we cannot quote a market price to-day. The American market is not quite so firm as it was two weeks ago, and any excess of stock which might be dumped there, would be felt severely, and no doubt cause a slump. In some sections the railway embargo still holds, but in the majority of towns it has been raised. Of course, where concerns are not clearing their tracks when the stock accumulates, a ban is being put upon them and no stock can be cleared for their yards until their sidings are cleaned up. Taken as a whole, the American market is very disappointing, and those parties who predicted a good year and said the market was very firm were the first to concede prices. Schedule prices have dropped to $27.00 base, which is one dollar less than two weeks ago. The American spruce board market is also in the same condition as dimension, gradually easing away. Of course, every year, after all the mills get in motion in Maine and elsewhere, it is a usual thing for the U. S. market to recede, and this year is evidently no different from the past.

Laths are fairly firm, but the very heavy coastwise freights are eating up the big end of the price. As high as $1.25 per M. has been offered for vessels from St. John, a usual high figure being 80c. per M. This will only leave about $2.50 per M., f.o.b. mills.

Shingles are about 10c. per M. better in price than a year ago, but freights again enter into the question and eat up the extra price.

Locally, the market is better. No great amount of large building is being done, but a great deal of repair work is being carried on and factories are all very busy. Refuse lumber prices remain about the same as a year ago, but probably, with an accumulation and with mills running, prices will decline.

The drives in the St. John river are only making fair headway. The spring has been exceedingly dry and water has fallen very rapidly. Messrs. Murray & Gregory, Ltd., were forced to leave about three

Established 1894 ***Incorporated 1908***

Campbellton, New Brunswick

million of their drive on Lae Frontiere, Quebec, but as they are erecting a new large mill at that point, this will not prove a loss, as the logs will be sawn there.

Randolph & Baker have hung about three million on Little Black River; Cuncliffe Bros., about one million on the Allegash, and Stetson, Cutler & Co., about one million on the Tobeque. All the rest of the logs are on the Corporation, but unless rain comes some more logs are sure to hang in the Main river.

Liverpool Market Reports

Alfred Dobell & Company, Liverpool, England, in their timber market report under date of May 1st, say:—

Spruce deals.—Operations have been less active, but values continue firm. First-hand stocks are light and the difficulty of renewing supplies is even more accentuated than it was. The freight problem is becoming more and more difficult of solution, and it is questionable now whether there will be sufficient tonnage available for the freighting of the season's requirements.

Douglas fir.—The small quantities that have arrived per liners for delivery against contracts have passed readily into consumption and the market stands practically bare of supplies. There is no freight room obtainable at the present from the Pacific Coast and the prospects of relief in this direction are not promising.

Flooring boards have arrived rather freely and chiefly against contracts. The enquiry has been somewhat languid, but the stocks are being held firmly.

Liverpool and Manchester Stocks

The following report upon Liverpool and Manchester stocks for the month ending April 30th, 1916, is furnished by H. W. Lightburne & Company, Liverpool, and their St. John, N. B. representatives John E. Moore & Company, Limited.

Reports from points in Northern Maine indicate that the log cut in that district will be larger than was expected at first. Market conditions have improved greatly since the operators made their first plans for the season. Many who went into the woods with the intention of taking out 25 to 50 per cent. less logs than usual, were so encouraged by improved market conditions that they changed their plans, and in some instances took out fully 25 per cent. more logs than ever before.

A Fine Calendar Widely Appreciated

Jas. D. Lacey and Company, timberland factors, Chicago, and Seattle, sent out to their business friends, early in the present year, a calendar for 1916 which was one of the most striking and artistic calendar productions we have had the pleasure of seeing. The calendar consisted of a large photograph about 10 in. x 19 in., showing a beautiful group of Sitka spruce trees. The photograph was handsomely mounted and a calendar pad of practical size was attached beneath. This calendar had a wide distribution and its beauty brought forth many expressions of well-merited praise. Nearly all of those who wrote to the company stated that the calendar had been given the place of honor in their private offices.

Canadian Box Shooks Required in South Africa

in a recent issue, states that a South African merchant is open to import box shooks from Canada. He will purchase not less than $10,000 worth annually in small sizes. His trade is chiefly with fruit growers.

The following details are submitted for the information of intending exporters:—

Wood must be white, free from knots, and fine sawn. Sizes mainly required are: 18 x 12 x 2½ in.; 18 x 12 x 3 in.; 18 x 12 x 3½in.

Thicknesses of wood for the above are:—

Two ends .... ½ in.
Two tops .... .3/16 in.
Two bottoms ....3/16 in.
Two sides ....3/16 in.

An air space of one-half inch is to be allowed clear on each side, and on tops, bottoms, and sides. Thus to cover the lid there are required two pieces 5½ inches wide and bottoms 5½ inches wide. Sides will also be one-half inch short of the actual depth of ends.

Shooks should be packed in bundles in such a manner that 14 bundles make 100 boxes.

Large quantities of boxes size 18 by 12 by 5½-inch are also required.

The following are the thicknesses of wood for the above:—

Two end pieces .... ⅝ in.
Two tops .... .3/16 in.
Two bottoms ....3/16 in.
Two sides ....3/16 in.

The same number of pieces and the same air space referred to above are required.

Orange Boxes

The export of oranges is calculated in a few years to use millions of boxes. The size of the cases required is 26 by 12½ by 12½-inch.

These boxes are made up of eleven pieces, consisting of two tops, two bottoms, four sides, all of equal size, with ends and one centre piece of equal size. The ends and the centre piece should be made solid by patent jointing process. Steel clips are of no use.

The ends and centre piece should be 12 by 12 by ⅝-inch, and tops, bottoms, and sides 26 by 5½ by 3/16-inch.

There has also arisen a demand for tops, bottoms and sides measuring 26 by 5½ by ¼-inch.

Goods should be shipped through bankers against documents Cape Town, and prices quoted c.i.f. Cape Town are preferred.

Dry Rot Case Before Court of Review

The Court of Review recently heard argument in one of the largest and most important cases that have appeared in Canadian courts for some time past, namely, the case of the Canadian Spool Cotton Company against Peter Lyall & Son, contractors, and Brown and Vallance, architects. In the original case the Cotton Company claimed $91,802.42 as compensation for the cost of remedying certain alleged defects in the construction of the plaintiffs' cotton mill at Maisonneuve, P.Q. These defects were put under protest to effect a remedy, but nothing was done on their behalf, it was complained, and the plaintiffs ripped out all the timber beams and substituted steel. Their suit was to recover costs for this work. They brought action in the Superior Court against the architects and contractors and judgment was given for them for $71,000 damages against the defendants jointly and severally. It was against this judgment that argument was heard in the Court of Review, upon which judgment is now being awaited.

The contractors urged that the timber used was in accordance with specifications and denied all liability. The architects claimed that even if they should be held liable they could not be obliged to pay for the substitution of steel for timber. They had agreed to offer the plaintiffs $5,000, so as to save further loss of time and to avoid litigation.

The contract in question was entered into in 1907 between the plaintiffs and the architects to make plans and draw up specifications and superintend the construction of the plaintiffs' spool cotton factory at Maisonneuve, the remuneration to be 4 per cent. of the cost of the work. After the plans had been made they were submitted to J. & P. Coates, in the Old Country, the plaintiff company being a subsidiary of the Coates Company. The plans were returned in 1908. The work of construction was carried on by Peter Lyall & Son, and the plaintiffs entered into possession and occupation before the certificate of the architects was delivered to them. Complaints were then made of poor quality of timber in the work and it was alleged that the whole interior woodwork was infected by dry rot. No final certificate was issued by the architects to the contractors, according to the defendants' statement, and, therefore, both architects and contractors denied their liability for the loss. The judgment of the Court of Review will be of great importance to the timber trade in Canada, as well as to architects and contractors.

J. G. Riordan, of the Riordan Pulp & Paper Company, left an estate valued at $745,601.

SUPPLIES

Everything in the Grocery line that's needed for the Camps—we are ever on the look out for goods that will meet your requirements and now have on hand a number of splendid lines which you can without doubt use to good advantage in these times of rapidly advancing prices for all food products. Here's a little list. If you notice anything that you can use we shall be glad to hear from you.

Greek Valencia Raisins, 50 lb. Boxes	6½
California " " "	7¾
Fine Filiatra Currants, Cleaned	12½
California Evaporated Peaches 50s	3¾
California Standard Apricots 25s	9½
Choice Natural Figs 28s	7½
Gallon Rhubarb	1.75
" Apples	2.75
" Lombard Plums, Heavy Syrup	3.25
" Pie Peaches	2.25

Keeping up with the Trade Procession

Logger, Millman, Wholesaler and Retailer All Interested in Effective Co-operation to Promote Business

In order to keep abreast of the times and to make sure that their business will not only hold its own, but make reasonable progress, it is necessary for retail lumbermen to give a good deal of their attention to the problem of trade extension. At a recent convention of retailers this question was discussed at considerable length by Mr. H. S. Sackett, of Chicago. While Mr. Saskett's remarks relate to conditions existing across the line, many of his points apply forcibly in connection with the retail trade in Canada. Some of the ideas brought out in the course of his address were as follows:—

For a number of months I have lived in an atmoshere of trade extension. I have heard it discussed by manufacturers, wholesalers and retailers. I am thoroughly saturated with it. Some time ago I began to wonder what it was all about, why the lumbermen all of a sudden were interested in such forms of publicity as newspaper and magazine advertising; in moving picture films; in talking frankly about their products to architects and engineers; in asking the public to come and see their wares at expositions and building shows, and I began to analyze the situation—and what did I find? I found simply this: That the lumbermen away back in the early days were absolutely alone in the building material field—there were no competitors; that for many years this condition of affairs obtained; that a few years ago two important things happened, namely, competitors of wood came into existence, and the era of advertising began; that these two got together and hit wood such a tremendous blow that some of the lumber manufacturers have not even yet awakened to a realization of what happened.

It's all very simple, isn't it? But why were the lumbermen, if they were good business men, so slow to realize what was going on? I must confess that for a time I could not understand it, but now I think I have the answer. It was for two reasons. In the first place, wood's competitors got busy when business was good and prices were high, and by efficient manufacturing and merchandising methods, and an effective advertising campaign, they attained an enormous growth in an extremely short time. In other words, they got in before the lumbermen realized what was going on.

The other reason for their success is a psychological one. To show you what I mean I want to compare for a moment the steel business and the lumber business. In the case of the former, nature put the iron and the coal deep down in the ground, and it was necessary for the steel men to dig for it, and after they got it to the surface of the ground, to get the two materials together by means of transportation. It is thus seen that they had difficulties in getting their raw materials together. But what of the lumbermen? Nature planted the trees on top of the ground and scattered them all over North America. There was no difficulty in securing raw material at almost any point where it was wanted.

And how about the manufacturing part? Here again the steel men had great difficulties. The manufacture of their product is a difficult and costly one, requiring large investments of capital for plants; but this is not true of the lumber industry. Certainly a very small sum is involved for a plant in comparison with the steel plants, and so here again the lumbermen have had a big advantage.

How Advertising Creates a Market

And how about the merchandising methods? The steel men with a high priced product, and with a comparatively undeveloped market for it, were obliged to advertise widely, to spend large sums in so doing, to employ high salaried salesmen, to build laboratories with which to experiment. But how about the lumbermen? They had no such problem. The public for years had used wood and knew all about it, or thought they did. Their market was already prepared. They had to spend no money in advertising, nor in the employment of high salaried men. And so it has been all through the two industries, difficulties on the one hand, and comparative ease on the other, and what is the result? The men of one industry are trained to cost accounting; to the minutest details of management; they are taught, if you please, to think in terms of the fraction of a penny; while those of the lumber industry accustomed to big margins, and having lived without the necessity of strict economy, are easy going, untrained in system, or cost accounting, and are thinkers in the dollar fraction instead of the penny. If $27.50 is too high a price, the next is not $27.49, or $27.45, as the steel man would say, but $27.25, or an even $27.00. What is true of the steel industry is also true of the cement industry, and the others competing with wood, and that is why, in my judgment, the lumbermen have been so slow in awakening to the situation, and is why we are hearing so much nowadays of trade extension in the lumber industry.

Mr. Sackett then explained the work of the trade extension department of the National Lumber Manufacturers' Association, pointing out the ways in which it is prepared to assist retailers in developing their trade. Continuing he said:—

The trend of modern business methods is towards publicity, and this publicity in a large measure takes the form of direct advertising.

If your public doesn't know who, nor what, nor where you are, nor what you can do for them, you will not profit. You must let them know these things; you must make them know. In a word, you must advertise. Some dealers complain that the mail order houses are injuring their business; they say that people in their territory have bills shipped in before the dealer even knows that a building is contemplated, and why? Simply because the mail order house advertised, and the mail order house's advertising was better than yours when you did advertise. It had to be, for it had to counteract your reputation for square dealing, your service, the power of your presence, your personal argument, your extension of credit, the quality of your materials—that is, provided you had all these things. And more than this, the mail order house kept right on after your customers, not for a day, or a week, or a month, but for years. The general manager of one of the largest mail order houses in the country said last year that they often followed up a prospect for three years, but finally landed him. Do you ever do that yourself? And still more, these houses keep on suggesting new comforts, new conveniences, new uses for their materials, until by force of repetition the prospect becomes an active customer for that article—people whose name he naturally connects with the thing that he wants?

The Use of Local Papers

You should unquestionably advertise in your local papers. This advertisement should be educational, rather than the mere statement that you have lumber to sell and can make prompt deliveries. The desirability of wooden structures should be carefully pointed out; it should be followed by specific suggestions as to the kind of material to select, and how to use it to the best advantage. This makes it necessary for you to be an information bureau, but it will well pay you to know more about lumber products than anyone else in your community. This educational publicity should be supplemented by literature on the different woods, which is easily obtainable from the various manufacturing associations.

There has been a great waste in the past and a failure to get the most out of available literature, because of the poor display or lack of distribution. You should have in your office an attractive rack in which the more important lumber literature is displayed. This would make it available to callers, and also serve as a reference library. A good plan is to send out notices from time to time to the consumers, stating the literature which is available in your office, or which will be sent upon request. You should notify your customers from time to time that you have a good reference library on farm structures which is at the service of any who may be interested.

The proper handling of lumber consumers in any community means a systematic listing of names, and a follow-up system. The best plan is usually to install a simple card system, giving the names and addresses, and noting on the cards the needs and requirements of the different individuals as ascertained, and the time of their last purchase. For example, if you find that a farmer in your community is contemplating building a new barn next spring, or a new silo, this should be noted, and should be followed up by letters and literature on the subject. A constant stimulation of interest is necessary, either by circular letters, by envelope inserts or the distribution of literature.

You should have displayed in your office attractive samples of the woods that you have for sale. You should show them in the rough, and in a surfaced condition; you should show samples of moulding, of casing, of base boards, of interior finish, panels, and all the various products of wood that you have to offer. You should fix them up so neatly and attractively that the man who is going to build a home would come to your office, and look over your commodities in just the same way that he goes to the dry goods store and looks over their goods before he buys.

It would be an excellent plan from time to time for groups of dealers in the larger towns and cities to get together, and have a dinner and invite your architect and engineer friends to come and talk to you about their problems.

out what the changes are going to be; ascertain if anything detrimental to the use of wood is proposed; write the trade extension department what is going on, so that we may have an opportunity of sending one of our special representatives to help you, if help is needed. In this connection we are now working on a standard building code for towns and cities of various sizes, all of which information will be at your service.

Take an interest in the question of fire protection; keep in touch with your building commissions and city councils; show them that you are as much interested in safe building construction as any other good citizen, or as the manufacturer of non-combustible materials; make it clear to them that it is not the use of wood, but its unsafe use that contributes to the fire danger. Keep your business before the public, and above all, keep plenty of news concerning the lumber industry in your local papers.

Who Is Your Competitor?

And now in closing, may I say just a word to you about competition? When you speak of "competition" or your "competitor," just what do you mean? Your only competitor can be that merchant in your own industry, in your own distributing territory, who has the same stock, the same knowledge, the same energy and financial strength as you have. If there is any difference in any of these elements, then the balance of trade will sway towards the better equipped, and true competition will cease. Let me illustrate: Suppose we have a town with three yards. If you are only a "material" man, the only competition you will have will be with the other "material" man. If, however, you add to your equipment, a knowledge of your materials and their uses, you rise above the "material man's" competition, and your only competition will then come from someone equally well equipped. The higher you rise the smaller becomes your field of competition and the greater your chances to secure the trade, and that rise in the scale depends entirely and absolutely on each one of you individually. One retail lumberman said not long ago that he was going to stop talking "service" because he didn't see where it did him any good. It didn't—simply because that was just exactly what he did—talk service. He didn't give service. Service, adequate service, is your only hope of salvation.

Every Branch of the Industry Must Co-operate

Above all, you should co-operate with every branch of the industry. Remember, that the owner of the primary raw material is the first link in the chain, the last link being the yard clerk who receipts to the ultimate consumer for the last payment on the little home, and each link depends on every other. It takes the combined action of every branch of the industry to complete the sale on which the livelihood and prosperity of all and each depends. A sale is never made to the people but to the individual, and as that sale is the exchange of money for a board cut by the logger, surfaced by the manufacturer, stored by the wholesaler, and delivered by the retailer, it follows that each is a necessary and interested link in the sales chain. The logger is just as much interested in the way you meet a customer as you are in the way he cuts his trees. The manufacturer is just as much interested in the care your yard man gives to the stocks as you are in the way those boards are made, graded and shipped.

Strain on any link weakens the entire chain, and failure of any branch to co-operate fully and properly with the others for the real object of all—the sale to the ultimate consumer—jeopardizes the business welfare of everyone connected with the industry. And accordingly everyone should be interested in seeing that the others do their proper share in the whole work. Lack of real co-operation, to put it in the mildest way, is just plain "bad business."

More Canadian Forestry Battalions Wanted

An Ottawa despatch under date of May 28th, states that the War Office has called for another Canadian Forestry Battalion of 1,500 men. The 224th Battalion, under command of Lt.-Col. Alex. McDougall, has done such excellent work in England and Scotland in aiding the naval and shipbuilding industries that a second battalion of this nature has been authorized at the request of the British authorities and recruiting will begin immediately in the lumbering districts. Lt.-Col. J. B. White, of Montreal, formerly of the Riordon Pulp and Paper Company, who is now with the 224th Overseas Battalion, has been recalled to organize and command the new regiment. A third Battalion is also to be raised, with Lieut.-Col. W. R. Smyth, M.P.P. for Algoma, in command. This Battalion will be raised in Ontario.

The Forestry Branch of the Department of Lands, Forests and Mines of the Province of Ontario have issued an illustrated bulletin upon "The White Pine Blister Rust," a dangerous disease of white pine. The bulletin contains a discussion of the disease, a description of its activities and an account of the method of eradicating it by destroying neighboring currant and gooseberry bushes upon which the spores depend for their reproduction.

Setting Up and Babbitting Journal Bearings

The practice of lining journal bearings with a metal that is sufficiently fusible to be melted in a common ladle, is not always so much for the purpose of securing anti-friction properties as for the convenience and cheapness of forming a perfect bearing in line with a shaft without the necessity of boring. Boxes that are bored, no matter how accurate, require great care in fitting and attaching to the frame or other parts of a machine. It is not good practice, however, to use the shaft for the purpose of casting the bearing, especially if the shaft be steel, for the reason that the hot metal is apt to spring it. A better plan is to use a mandrel, the same size or a trifle larger, for this purpose.

For slow-running journals, where the load is moderate, almost any metal that may be conveniently melted and will run freely, will answer the purpose. For wearing properties, with a moderate speed, there is probably nothing superior to pure zinc, but when not combined with other metal it shrinks so much in cooling that it cannot be held firmly in the recess, and soon works loose; also, it lacks those anti-friction properties which are necessary in order to stand high speed. For lineshafting and all work where the speed is not over 300 or 400-r.p.m., an alloy of 8 parts zinc and 2 parts block tin will not only wear longer than any composition of this class, but will successfully resist the force of heavy loads. The tin counteracts the shrinkage, so that the metal, if not overheated, will firmly adhere to the box until it is worn out. But this mixture does not possess sufficient anti-friction properties to warrant its use in fast-running journals.

Among all the soft metals in use, none possesses greater anti-friction properties than pure lead; but lead alone is impracticable, for it is so soft that it cannot be retained in the recess. When by any process lead can be sufficiently hardened to be retained in the boxes without materially injuring its anti-friction properties, there is no metal that will wear longer in light, fast-running journals. With most of the best and most popular anti-friction metals in use and sold under the name of babbit metal, the basis is lead. Lead and antimony have the properties of combining with each other in all proportions without impairing the antifriction or wearing properties, or will stand a higher speed without heat or abrasion. It runs freely in its melted state, has no shrinkage, and is better adapted to light, high-speed machinery than any other. Care, however, should be exercised in using it, and it should never be heated beyond a temperature that will scorch a dry pine block.

It is difficult at the present time to determine the exact formula used by the original Babbitt, the inventor of the recessed box, as a number of different formulas are given for that composition. Tin, copper, and antimony were the ingredients, and from the best sources of information, the original proportions were as follows: tin, 50 parts; copper, 2 parts; antimony, 4 parts. The copper was first melted and the antimony added, then about 10 or 15 lbs. of tin, the whole kept at a dull heat and constantly stirred until the metals were thoroughly incorporated, after which the balance of tin was added, and after being thoroughly stirred again it was cast into ingots. When copper is thoroughly melted, and before the antimony is added, a handful of powdered charcoal should be thrown into the crucible to form a flux, in order to exclude the air and prevent the antimony from vaporizing; otherwise much of it will escape in the form of vapor and consequently be wasted. This metal, when carefully prepared, is probably one of the best in use for lining boxes that are subject to a heavy weight and wear, but for light, fast-running journals the copper renders it more susceptible to friction, and it is more liable to heat than the metal composed of lead and antimony in the proportion just given.

When pouring the metal, provide two pieces of shafting for mandrels, somewhat longer than the bearing or box to be babbitted. One of these should be turned to a size about 1/32-in. larger than the diameter of shaft, and is to be used for shaping the babbit in pouring. The other mandrel should be of the same diameter as shaft which is to run in the bearing; this mandrel is for use when scraping the babbitt metal to a bearing. If it is inconvenient to procure a piece of shafting larger in diameter than the journal, the difficulty may be gotten over by placing a sheet of strong, smooth paper around the mandrel that is same diameter as shaft, and pouring the metal around

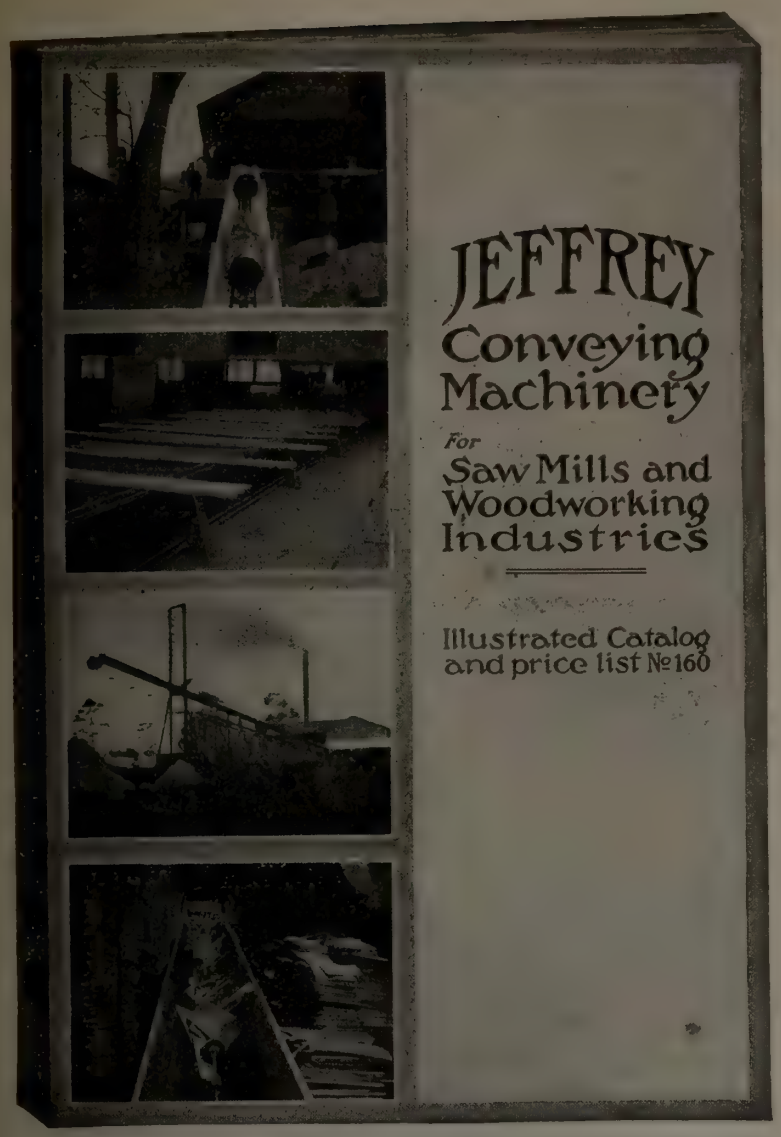
Surpasses Everything

Editor Canada Lumberman:— Westboro, Ont., May 24.

I have subscribed for the Canada Lumberman since it was first published; a small sheet at that time. I have watched it grow with much interest, but your last Annual Number surpasses in every respect anything I had anticipated. Take the cuts on pages 34 and 35; I do not think they can be surpassed on this continent. They are only samples of all the other parts of the issue. Wishing you continued success,

Yours truly,

I. N. Kendall.



Did You Get Your Copy of Jeffrey Catalog No. 160?

We want every Lumberman to have a copy of this book, which illustrates and describe sour complete line of Equipment for Saw Mills and Woodworking Industries, including

Standard Conveying Chains, Sprockets, Gears, Malleable and Steel Elevator Buckets, Elevator Casings and Boots, Spiral and Belt Conveyors and Fittings, Hangers, Bearings, etc.

Loss of Time and Production in Your Plant Makes Break-Downs Costly.

With this 144-page catalog at hand, you can quickly pick out the part you need, then write or phone our Montreal Office and receive immediate shipment from their Big Stock — the kind of service you will appreciate in an emergency.

it. The thickness of the paper around mandrel and the contraction of the soft metal when cooled, will serve to relieve the journal from being pinched by the babbitt metal, which is liable to occurr when the metal is poured dircetly around the journal.

Two thin pieces of wood liners, one for each side of the box, should also be prepared, and they should be about the thickness of the permanent liners to be used. One edge of these wooden liners should be notched, to allow the metal, when poured from above, to fill the lower box. These liners are placed between the cap and bottom half of box, with shaft in a central position, and the parts of the box clamped together. In case the box is secured together by means of bolts, the outer edges of the liners are slotted to fit the bolts. Small wooden blocks, cut tapering, are placed in each end of box to maintain the shaft in a central position. The box is placed horizontally in a vise and the shaft centered by means of calipers, the shaft being moved by moving the wedges in or out as needed. After the shaft is correctly located, the ends of the box are stopped by means of putty, or other convenient method which will prevent the metal from flowing out; a putty funnel is also built up about the hole into which the hot babbit is to be poured.

The babbitt is heated in any convenient way until it is fluid. Care should be taken that it does not get too hot, or its efficiency will be diminished. A good way of testing is to dip a soft pine stick in the metal; when hot enough to char it the proper temperature is reached. Then pour into the box through the funnel, as rapidly as possible, as the metal quickly sets, and if this occurs the box is spoiled and must be cleaned and repoured. After the metal has set, the spur in the funnel is broken from the cap, the cap removed from lower part of box and the shafting removed. The babbitt should have formed a reasonably smooth surface and be free from cold shots. In cold weather it is sometimes advisable to warm the shaft used as a mandrel.

When cap and box are poured separately, the melted babbitt metal is usually poured into one side of bearing and rises along the other side until the cavity is full. When pouring a bearing of this character move the ladle from one end of the bearing to the other, causing the stream to traverse along the slot, thereby keeping the babbitt at approximately the same temperature in all parts of bearing. When two ladles are used to pour from it will be sufficient to pour into diagonally opposite corners of bearing, and if both streams be poured quickly, the cavity will be filled before the metal becomes too cold to flow to the corners. Oil channels may be formed in the lining by means of a small, hard, spun cord, wound around the mandrel in the direction the shaft is to run. The cord should be rubbed smooth with putty before being placed upon the mandrel.

It was stated above that the temperature of the alloy, when poured, should be just high enough to slightly char a soft wood stick. This is a general rule, and by following it the millwright will not go far astray on ordinary work, but there are exceptions. When thin, solid boxes must be poured. and there is a long, narrow, or thin space to be filled with soft metal, it is sometimes necessary to pour the metal hotter than described. In such cases, the metals to come in contact with the soft metal should always be heated as much as possible before pouring in the lining. When a ladleful of metal fails to fill a box, and another ladleful is not at hand, do not try to fill the box by pouring hot metal on top of the cold, for it is very seldom that such a course results in a satisfactory bearing. Hot babbit will not unite with or weld itself to cold babbitt by simply pouring one on top of the other. Therefore, should a man fail to fill a bearing when pouring in the lining, it is decidedly the best practice to take down and chip out the partially-filled bearing, then set up again and pour a supply sufficient to fill the bearing.

When babbitt or other lining metal is poured into a cold casting, the lining becomes chilled before the iron casting becomes heated, therefore when the soft lining finally cools it shrinks away from the casting and becomes loose. Heating the box before pouring in the soft metal lining will prevent this looseness, as the iron casting then shrinks with the soft metal lining on cooling, and holds it fast when cold. One way of fastening a lining tightly into a cold casting is by using one of the antimony alloys, as the lining antimony, when alloyed with lead and with some other soft metals, loses the power of shrinking during the freezing process, and, like water, expands and fills the casting so tightly that there is no rattle or looseness. Therefore, when forced to line a cold bearing, use an antimony alloy.

In order to obtain a good and reliable journal bearing the babbitt should, after cooling, be scraped and accurately fitted to the journal. For this work the mandrel previously referred to, which has been turned to the same size as the shaft, is now covered with ultramarine, placed in the lower half of the box and revolved. Upon removing it the high spots in the babbitt will be plainly marked. There may be only two or three spots so marked at the first trial, but these indicate that the shaft touches the bearing only at those spots. The metal should be removed at these spots by scraping, after which the mandrel should again be placed in bearing and revolved. This time the shaft may touch in four or five places, as indicated by the markings. This process should be repeated until the bearing spots appear practically all over the surface of the babbitt box, when it may be assumed that the job is completed. Plumbago or red lead, mixed with oil, may be used on the mandrel for the marking, in the absence of the ultramarine, and the mandrel should be rubbed with it each time is it tried in the bearing.—J. H. B., in The Woodworker, Indianapolis.

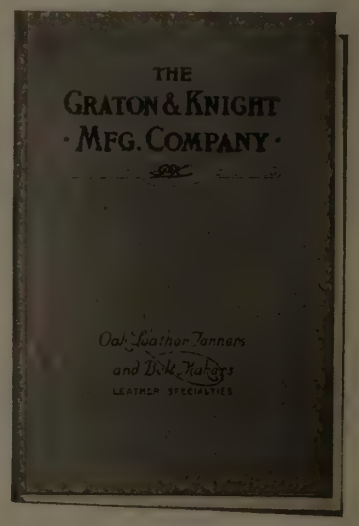
A New Bulletin on Jeffrey Products

The Jeffrey Mfg. Company, Columbus, Ohio, are distributing an interesting bulletin upon "Manganese Steel Chains," containing full details and prices of their Detachable, Peerless and "Hercules" types of Manganese Chains, sprockets and attachments. These ensure a maximum of elevator and conveyor service in connection with aggravating cases of wear in which conditions require the chains and sprockets to handle gritty and abrasive materials. All styles and sizes of chains as shown in the bulletin are carried in stock for immediate delivery. Others will be added by the company as facilities permit. Requests for this bulletin, or for additional information on Manganese or other types of Jeffrey chains for all elevating, conveying and power service, may be addressed to the Montreal office of the company, Power Building, Montreal, P.Q.

Graton & Knight's Fine New Catalogue

A new catalogue has just been issued by the Graton & Knight Mfg. Company, oak leather tanners and belt makers, Worcester, Mass., which is a fine specimen of catalogue work. Besides illustrating and describing all the company's products, the catalogue contains many facts of general interest to those who purchase belting, lace leather, packings, and other leather products.

The belting section of the catalogue describes the qualities of each grade manufactured, and tells why they are suited specially to their particular work, describing at the same time their differences and capabilities. In this section the catalogue includes also valuable



mechanical rules, tables and formulae, which will assist the buyer in determining the proper grade, width and weight of belting required for any given drive.

One section of the catalogue is devoted to leather packings, describing all the varieties and grades and explaining their special advantages. The company manufacture all kinds of straps, automobile leathers, halters and other leather sundries, amounting to hundreds of different products. These are illustrated and described in a special section of the catalogue. A copy of the catalogue will be sent on request to executives, purchasing agents, managers, superintendents, mechanical engineers, and others interested in the buying of belting and other leather products.

Among the members re-elected at the Quebec Provincial elections are, Mr. E. Ouellette, Yamaska ((acclamation), and Mr. R. Tourville, Maskinonge, both of the Tourville Lumber Mills Company, Louisville and Montreal; and Mr. Walter Reed. lumberman, Montreal, for D'Assomption (acclamation). All these gentlemen are supporters of the Government.

Latest reports from New Brunswick points state that recent rain falls have raised the water in the rivers sufficiently to bring out a number of drives that were threatened with being help up. Drives on the Nashwaak have benefited more than others by the high water. The benefit is also being felt on the St. John River and its tributaries.

Wm. A. Dunn, J.P., one of Toronto's well known lumber merchants, died at his home recently after an illness of several months. The late Mr. Dunn conducted a large lumber business at 102 Davenport Road. He was born at Toronto in 1861. He is survived by his widow, two sons and five daughters.

Stable and Storage Tents

Gable End and Hipped Styles

TENTS that are strongly made, reinforced with manila rope where strain is greatest, easily erected and adjusted. Walls are detachable.

A stock of these tents in various sizes is always kept ready for immediate shipment.

We will be pleased to mail or telegraph prices at any time. Send for our "Catalogue de Luxe."

EDGINGS

Ontario

Chas Wilcox, McIntosh Mills, Ont., recently lost his sawmill by fire.

The National Wood Mfg. Co., Ltd., South River, Ont., has obtained a charter.

The damage caused by fire recently at the plant of L. W. Fick & Son, Simcoe, Ont., amounted to $8,000. Upon this there was insurance of $4,595.

Fire destroyed Chrysler's barrel heading and custom sawmill at Windham Centre on May 27th. The loss included about $1,500 worth of heading. Stock to the value of $2,000 in the yard and some custom lumber was saved.

Rankin & Company, Limited, have been incorporated with head office at Toronto, Ont., and capital stock of $100,000, to carry on business as timber merchants, sawmill proprietors, timber growers and dealers in timber and wood of all kinds. The provisional directors are A. W. Holmsted, N. R. Kay and E. M. Carruthers.

A by-law has been carried at Campbellford, Ont., authorizing a loan to the Northumberland Paper & Electric Company of $30,000, to assist them in rebuilding their paper mills, which were recently destroyed by fire. The company intend to put up a much larger plant than the former one.

The Peerless Pulp Company, Thorold, Ont., have taken over the old Inland Paper & Pulp Company of that place. The plant, which was formerly that of the Colonial Wood Products Company, and has been idle for three or four years, will be operated again early in June, giving employment to about forty men at first. Herman Reiger, of Niagara Falls, N. Y., is president of the new company, and H. A. Constantine, Niagara Falls, N. Y., is treasurer. Edward Foley, Thorold, Ont., is vice-president and general manager.

Eastern Canada

The Eagle Lumber Company, Limited, St. Jerome, P. Q., have increased their capital from $90,000 to $500,000.

The R. & T. Ritchie Company, at Aylmer, P. Q., expect to commence operations on a sawing contract for the Hawkesbury Lumber Company about June 10th.

The St. Croix Lumber Company, Hartville, N. S., suffered a loss by fire recently. The fire started in their store and spread rapidly, consuming a barn, boarding house and several small buildings.

Fraser & Company's mills, Aylmer, P. Q., which have been closed during the past year and a half, will begin operations again early in June, having a contract to saw for the Hawkesbury Lumber Company.

The wholesale and retail lumber business of the P. Vincent Lumber Company, Limited, 806 Notre Dame Street West, Montreal, has been purchased by Smith and Ste. Marie, formerly of 310 Board of Trade Building.

La Compagnie Chs. A. Julien, Limitee, has been incorporated with head office at Pont Rouge, County of Portneuf, P. Q., and capital stock of $145,000, to carry on business as manufacturers of and dealers in lumber, and to operate a timber business, construct sawmills, and conduct lumber yards.

The annual meeting of the Campbell-MacLaurin Lumber Company, Limited, was held on May 23 at the offices, Board of Trade, Montreal. The report submitted indicated that the company had had a favorable year, and that the outlook was very satisfactory, especially for the United States markets. The following officers were re-elected: Alex. MacLaurin, president; D. C. Culver, vice-president; Arthur H. Campbell, managing director; Geo. L. Ryon, and Maurice Welsh, directors.

Western Canada

The North Canada Lumber Co., Ltd., Prince Albert, Sask., recently suffered a loss by fire, which was covered by insurance.

C. Lindmark has leased the Canadian Pacific Lumber Company's mill at Pingston Creek, B. C., and is now operating it at full capacity, giving employment to thirty men.

J. E. Wade and H. H. Stuart are erecting a shingle mill at Squamish, B. C., at the head of Howe Sound, and will operate under the name of the Squamish Timber & Manufacturing Company, Limited.

Charles W. Tait & Company, Limited, have been incorporated with head office at New Westminster, B. C., and capital stock of $10,000, to carry on business as sawmill owners, loggers, lumbermen, etc.

G. G. Abernethy & Nelson S. Lougheed, who have sold their mills to the Maple Ridge Lumber Company, will in future give their whole attention to

logging operations in connection with their extensive timber limits in the Stave Lake country.

Mr. W. A. Anstie reports that the Forest Mills of British Columbia, Limited, have purchased the Arrow Lakes Lumber Company's mill at Arrowhead and over a billion feet of standing timber. It is reported that the deal represented over a million dollars.

The Ontario Lumber Company, Limited, has been incorporated with head office at Vancouver, B. C., and capital stock of $10,000, to carry on business as manufacturers of and dealers in lumber of all kinds, including wood pulp, paper mill refuse, and to own sawmills, planing mills, etc.

The Revelstoke Lumber Company, Limited, has been incorporated with head office at Revelstoke, B. C., and capital stock of $25,000, to carry on business as timber merchants, sawmill, shingle mill and pulp mill owners, loggers and lumber merchants, and to deal in saw logs, timber, piles and poles, lumber and wood of all kinds.

W. C. E. Koch's timber flume between his camp and the river at Koch's Siding near Nelson, B. C., was recently seriously damaged by some unknown cause. About 75 feet of the flume, located about half a mile from the river was completely destroyed, and it is supposed that someone placed dynamite beneath the flume and exploded it.

Sealed tenders are being received by the Minister of Lands for British Columbia until June 14th, 1916, for the purchase of License X614, to cut 1,547,000 feet of fir, cedar, hemlock and balsam, on an area adjoining Timber Sale X55, Redonda Island, New Westminster District. Two years will be allowed for the removal of the timber.

Sealed tenders are being received by the Minister of Lands for British Columbia until June 7th, 1916, for the purchase of License X530, to cut 1,087,780 feet of Douglas fir, hemlock, cedar and spruce on an area adjoining S. T. L. 43890, Swanson Island, Coast District, Range 1. Two years will be allowed for the removal of the timber.

Sealed tenders are being received by the Minister of Lands for British Columbia until June 7th, 1916, for the purchase of Pulp License X597, to cut 3,924,000 feet of spruce, balsam and hemlock on an area adjoining L. 730, Lake Island, Mathieson Channel, Coast District, Range 3. Two years will be allowed for the removal of the timber.

The Acorn Lumber & Shingle Company, Limited, has been incorporated with head office at Vancouver, B. C., and capital stock of $25,000, to carry on business as sawmill and shingle mill owners, timber and lumber merchants, and to take over the general contracting, mill, timber and mercantile business carried on by M. D. Irvine, at Burnaby, B. C.

The Maple Ridge Lumber Company have purchased the mills owned by Abernethy & Lougheed at Port Moody and Port Haney, B. C., and will operate both plants at full capacity. The Maple Ridge Lumber Company is a subsidiary of the B. C. Box Company of New Westminster. Their box factory is located at Queensborough, B. C. The head office is at New Westminster, B. C., and the capital stock is $25,000.

The Nor-west Farmers Co-operative Lumber Company, Limited, have been incorporated with head office at Vancouver, B. C., and capital stock of $100,000, to carry on business as sawmill proprietors, timber merchants, lumbermen, loggers, lumber and shingle manufacturers and to deal in saw-logs, timber, lumber, shingles, bolts and wood of all kinds. Those interested are M. L. Malloy, M. L. A. Gibson, J. H. Senkler, G. C. Van Horne and M. G. Caple, all of Vancouver.

About 50 shingle mills in the State of Washington were closed on May 1st as the result of a demand from the International Shingle-Weavers' Union of America for the reinstatement of the 1914 wage scale. About 1,500 men out of the 2,500 union members employed are reported to have gone out. The increase asked by the men varies from 2 to 15 per cent. and averages 10 per cent. above what they are receiving.

Manufacturers on the Pacific Coast, including British Columbia, have presented a petition to the Interstate Commerce Commission of the United States for a downward revision of the freight rates on sash, doors and other lumber products from the Pacific Coast to Eastern Canada, New England, New York, and other Atlantic Coast points. The petitioners state that the rates were increased last August from 1 to 20 per cent. and they ask to recover the excess already paid.

Carrying a cargo of lumber loaded at Chemainus on June 1st of last year, the American schooner J. M. Weatherwax is reported to have reached Sydney, Australia, on April 6th, after an eventful voyage of ten months. On August 14 of last year the schooner put in at Honolulu to repair damages sustained in a storm. A month later she set sail for Australia, but on October 5 again limped into Honolulu harbor in a leaky condition. Later she was libeled by the crew for unpaid wages and was ordered sold. At the sale the vessel was purchased by Mr. Neils Nielson, representing the New South Wales Government, to whom the lumber was consigned, for the sum of $3,200. A new crew was then shipped and on January 10th last the Weatherwax again left Honolulu for Sydney.

Advertising Ideas for Retailers

Individuality Essential to Good Results—Co-operation with Others Interested in Community Development

The subject of advertising has attracted a great deal of attention among lumber manufacturers in the United States during the past few years and important developments are being announced frequently, showing that manufacturers of lumber are continually increasing their appreciation of the importance of approaching the consumer through advertising as directly as possible. While this movement has not definitely extended to the Canadian industry, we expect that it will do so in the course of time, possibly in the quite near future, but even though Canadian manufacturers are not definitely advertising the chief lines of Canadian lumber in more than one or two cases, the advertising which is being carried on in the United States is being read by Canadian people in the big United States magazines, and manufacturers in Canada are finding out indirectly the effect of this means of promoting trade.

While the manufacturer has gone into the advertising business in the United States in a very large way, the average retailer has not by any means realized what he can do by means of advertising to improve his business. This applies also to the retailer in Canada. Recently we came across an interesting discussion of retail lumber advertising, written by Mr. J. B. Powell, instructor in advertising at the University of Missouri, and published in the St. Louis Lumberman. As a rule one expects a surplus of theory and not much in the way of practical stuff from a university instructor. In this case, however, the practical over-rides the theoretical so much that one would think that Mr. Powell was actually a successful retail lumberman, whose success had been built up by advertising. Some of Mr. Powell's ideas we are pleased to reproduce as follows:—

It has been the writer's pleasure, Mr. Powell says, to assist in a minor way in some of these recent advertising discussions, and as a result some dozens of letters from lumber retailers have been received in the last few months.

"We believe in advertising in our local papers, but how in the thunder are we going to do it and get our money's worth," some of the letters ask. Several of the letters said: "We have asked the local editor about it and, outside of the statement that 'It pays to advertise,' he seems to be as devoid of information on this subject as we are."

So how is a retail lumberman going to advertise? is the burning question. And we will answer this question by saying that it is just as difficult to outline a plan that would apply to all retail lumber dealers as it would be to outline a blanket plan of courtship that would be equally effective with college girls and militant suffragettes.

The lumber yard in the country town of 600 persons can advertise that it supplies house plans free, but this would play hob in a city of 50,000 people with half a dozen local architects on the job.

Forced Into a Price Competitive Existence

Many owners of lumber yards have felt that since most of their business comes from local architects and contractors, advertising to consumers is unnecessary. To state it in another way, they have permitted the contractors to force the lumber yards into a mere price competition existence. Before this impression gets any further my suggestion would be that the lumber retailer who makes himself solid with the consumer need not fear either contractor or architect, for the consumer is the man who is spending the money and has the right to say where the lumber comes from and what kind.

The lumber yard in a "tenant" farm community has a different problem from the yard in a farm or home-owned community. The yard in a tenant community should direct its advertising in the local newspaper to the owner of the land, telling him that better houses and barns make better tenants. This will have a wholesome effect upon the tenant in making him desire better things. Trust him to express his desires.

The yard in a "home-owned" community has but to create a local pride for good homes in its advertising, and this is comparatively easy. Automobile salesmen and manufacturers know that "pride and emulation" sell more cars than any other appeal. Prove this yourself by glancing through any magazine, and note the pictures of cars amid scenes of elegance and luxury.

The lumber retailer in a community that has the mail-order bee has still "something yet again" to consider. His problem is distinct and vital.

No Such Thing as a Blanket Ad.

With all these problems in mind we can see how difficult—yes, almost impossible it is, for anybody to prepare a blanket ad that every retailer in any one State even could use to advantage.

Since this article is not intended to exhaust the subject, I trust the header will indulge me for rambling all over the subject. So here is another idea.

Bankers all over the country have been pushing the thrift idea. Why doesn't this offer wonderful possibilities for local co-operative advertising on the part of lumber firms, banks, real estate men, building and loan associations? Here's an opportunity for community development that is worth while. It should not be difficult for the reader to imagine the results of an extensive, well-prepared campaign of co-operative advertising on the part of banks, real estate men, building and loan societies and lumber dealers. If properly handled this would be real community advertising with a money-back guarantee for the persons who conducted it, and for the good of the whole community.

But back to the advertising problems of retail lumber dealers. First we must admit that no blanket plan of advertising will fit all places. This makes the problem more difficult, but if the proper rules of common or horse sense are followed advertising for a lumber dealer is no more difficult than advertising for a drygoods or hardware store. And it can be made just as effective.

Use a Camera for Pictures to Illustrate Ads.

In these days when everybody owns a camera it should not be difficult for every lumber yard proprietor to obtain pictures to illustrate his ads. If there is a shingle roof in the home community that has given good service for a long period, why not get a picture of it and write an ad on shingles that will be as "newsy" as the column of personals from Homeburg Station. If George Smith builds a silo, why not take a picture of it and print it in the paper so that all the other George Smiths and Browns, and Johnsons will want one, too. The initial cost of the electros may seem high for one ad, but if the electro is good it can be also used in circulars, on letter-heads and on posters for several years. Another thing to remember when ordering electros is to send along to the engraver a sample of the newspaper that the "cut" is to be printed in. An electro for a newspaper will also show up well on higher grades of paper, but it will not always work the other way.

Another point to remember is that your ad is likely to be one of many ads that are all competing for the reader's attention. For this reason use plenty of white space in the ad, for this attracts attention to your copy. This is especially true where the ad is "all type" and without illustrations.

In selecting the type for an advertisement, it is wise to stick to one type family, or at best not more than two different styles of type. Every ad should bring out one important point and everything else should be subordinated. There should not be too many "display" lines. By display line is meant the heavy type that is used in the head-lines. The purpose of a display line is the same as a sign-board at a cross road. If there is one board at the corner that tells directions and distances the traveler can easily find his way, but if there are a dozen sign-boards pointing in all directions, the poor traveler is sure to go astray.

Most of the rules for writing advertisements also apply to letter writing and to the preparation of booklets and circulars. Every lumber dealer should have a mailing list of the people in his community. If this list is properly classified, it can be made a most valuable asset. Country newspapers offer valuable help in the building of mailing lists. Every wedding should offer possibilities for the sale of lumber as well as furniture or kitchen utensils. A newspaper item telling of unusual crop prospects should offer possibilities for the sale of lumber for barns, granaries, silos, or sheds. The arrival of a new family in the community offers lumber possibilities. If the lumber dealer also handles side lines, or "substitutes," in other words, these also should be exploited. The lumberman who sells paint should remember that a great place to advertise it is on the walls and sides of his own office.

Why shouldn't a man give his wife a hardwood floor as a Christmas or wedding anniversary present?

I recently saw an advertisement of a building and loan association that started out: "A man really does not begin to live until he owns his own home." Certainly it should be possible for the lumber retailer to "humanize" his business. The lumber dealer who encourages the people of his community to build better homes, barns and silos is more than a merchant; he is a public benefactor, for better homes make better citizens—and better citizens buy more lumber than the other kind.

The aggressive educational campaign of the Canadian Forestry Association in the cause of forest conservation has been supplemented by a new issue called "A Matter of Opinion." The booklet is an attractive one and strikes at the subject of forest guarding from a unique angle. Seven characters are introduced—Settler, Camper, Banker, Railway Man, Power Engineer, Fire Ranger, and Tax Payer—each telling his personal story of the need for living forests and the increasing menace of burned and wasted forests. The booklet makes easy reading, and a mass of information is packed into the 24 pages. Copies may be had free by addressing the Association's office, Booth Building, Ottawa.

LINK-BELT

for Conveying, Elevating and Power Transmission

THIS TRADE MARK ON EVERY LINK — IS YOUR GUARANTEE OF RELIABILITY

Link-Belt "H" Class Chains are generously proportioned for the service they are to perform. The rivets are made of .40 per cent. carbon steel, rolled true and smooth after forging. This process compresses the original hard scale surface, and materially increases the durability of the joint.

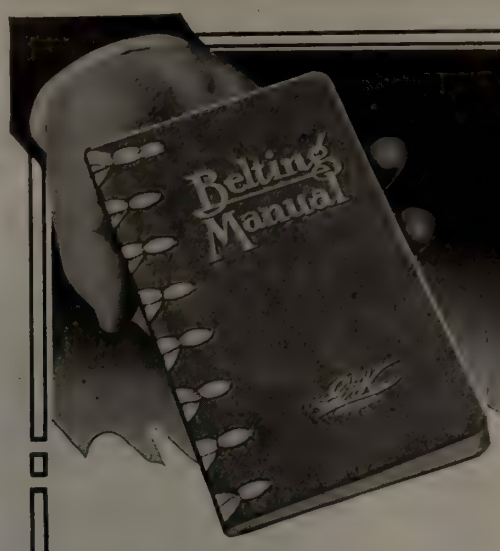
1189 King Street West, TORONTO

A. R. Williams Machinery Company, Limited, Vancouver, B. C.



This Valuable Book sent all Belt Users- for the asking

THE BELTING MANUAL, a hand book of 96 pages, substantially bound, is the most complete and concise book published on belt transmission. It tells

—how to select belting.
—how to install, lace and care for belting.
—how to make belting endless on the pulleys.
—how to find the width, speed and horse-power of belting.
—scores of other "hows" which are constantly coming up in your Power Transmission problems.

We want to send a copy of this book to every Mill Manager, Superintendent, Purchasing Agent, Foreman, Master Mechanic, Engineer or others who are actually responsible for the selection, installation and up-keep of belting equipment.

If you haven't a Belting Manual write us on your business stationery and a copy will be sent by return mail.

Our fifty years' experience in the design and manufacture of logging locomotives is at your disposal. Many of the largest logging operators in Canada are using our "Canadian Made" locomotives.

Our logging models are as carefully designed and built as our 200 ton sizes—oil or coal burning.

MAY WE SEND YOU SPECIFICATIONS?

This engine is 13½ ins. x 18 ins. and weighs 35 tons.

Canadian Locomotive Company, Limited, Kingston, Ont.
Taylor and Arnold Ltd., Sales Agent, Montreal and Winnipeg

Saving $100,000.00 Yearly on Coal Bills

Arrangement of Jones Underfeed Stokers in Dutch Oven for burning paper mill refuse in conjunction with coal.

That may sound fabulous but it is a fact established by the Minnesota & Ontario Power Company. Before the installations of Jones Underfeed Stokers 695 tons of coal at $3.50 per ton were the daily requirement. With the Jones Stokers and Dutch Ovens, as illustrated, the mill waste was utilized and only 5 tons of coal were burned each week.

This is only one example of many showing the immense saving in fuel bills effected by Jones Stokers.

We will be pleased to correspond with you regarding the use of Jones Stokers in your plant. Write us.

Jones Underfeed Stoker Co., Limited
National Trust Building, TORONTO

Dominion Timber Regulations

Licenses to cut timber on Dominion Lands in the Provinces of Manitoba, Saskatchewan, and Alberta, the Northwest Territories, within twenty miles on either side of the main line of the Canadian Pacific Railway in the Province of British Columbia, and in the tract of three and one-half million acres to be located by the Government in the Dominion in the Peace River district in the Province of British Columbia, lying east of the Rocky Mountains and adjoining the Province of Alberta, shall be disposed of by public auction at the office of the Dominion Timber Agent for the districts in which the berths are situated.

Before any parcel of timber is offered for sale it shall be surveyed by a duly qualified Dominion Land Surveyor into berths of an area not exceeding twenty-five square miles, and each of such berths shall then be thoroughly cruised by a duly qualified timber cruiser in the employ of the Dominion Government. The Minister shall then fix an upset price at which the berth shall be disposed of, and no berth shall be sold at less than the price so fixed.

Purchases to the amount of one thousand dollars or under shall be paid in cash at the time of sale. Purchases over one thousand dollars and not exceeding five thousand dollars shall be paid, one-half in cash at the time of sale, and a note or notes shall be given for the remaining half of the purchase price, payable in three months, with interest at the rate of five per cent. per annum. Purchases over five thousand dollars and not exceeding ten thousand dollars shall be paid one-third in cash at the time of sale, and notes shall be given for the remaining two-thirds of the purchase price, payable in three and six months, with interest at the rate of five per cent. per annum. Purchases exceeding ten thousand dollars shall be paid one-fourth in cash at time of sale, and notes shall be given for the remaining three-fourths of the purchase price, payable within three, six and nine months, with interest at the rate of five per cent. per annum. Notes shall be made payable at a bank in the city or town in which the sale is held or at a bank in the city of Ottawa. Cash payments must be made at the time of sale in legal tender or by an accepted cheque on a chartered bank, or by a draft issued by a chartered bank, payable to the order of the Deputy Minister of the Interior. If default is made in any payment required by this section the sale shall be forfeited and void.

The purchaser must also pay the cost or the estimated cost of the survey of the berth before a license is issued.

The licensee shall pay an annual ground rent of five dollars per square mile except for lands situated to the west of Yale, in the Province of British Columbia, in which case the yearly ground rent shall be five cents per acre.

The licensee shall pay the following dues on timber cut on his berth :—

Sawn lumber, 50 cents per thousand feet, board measure.

Railway ties, eight feet long, 1½ cents each.

Railway ties, nine feet long, 1¾ cents each.

Shingle bolts, 25 cents per cord.

And 5 per cent. on the sale of all other products of the berth.

Timber Permits

Yearly permits are granted to settlers, mine operators and others on application to the Dominion Timber Agents, from whom further information can be obtained.

W. W. Cory,

Deputy Minister.

Department of the Interior, Ottawa,
December 20th, 1912.

Here's what we do for you!!

Our Traffic Engineers know from actual experience the Hauling Problems of every business. This knowledge is worth money to you—if you will use it. We maintain a staff of trained Traffic Engineers who will tackle your problems of Haulage and Delivery in a business-like way, and give you a report that will present in facts and figures the most economical method that you can adopt to get the most efficiency in the delivery end of your business.

NATIONAL Motor Trucks are made in four models — 1500 pounds, 2000 pounds, 4000 and 7000 pounds. Capacities that provide a truck for every line of business.

If you are as thorough in your investigation of the different makes of Trucks as we are in the construction of the NATIONAL you will own a NATIONAL Truck.

Conferring with us entails no obligation. Catalogue mailed upon request.

Fan Wheels For Handling Shavings

Each particular class of shavings, refuse or sawdust, requires a special wheel.

Sturtevant Trade Mark PLANING MILL EXHAUSTERS are made with many different types of wheels—one for each class of service. We do not make just one wheel and recommend it for all conditions, but we consider each case individually.

Why not talk it over with one of our engineers?—or get catalog 185-C.

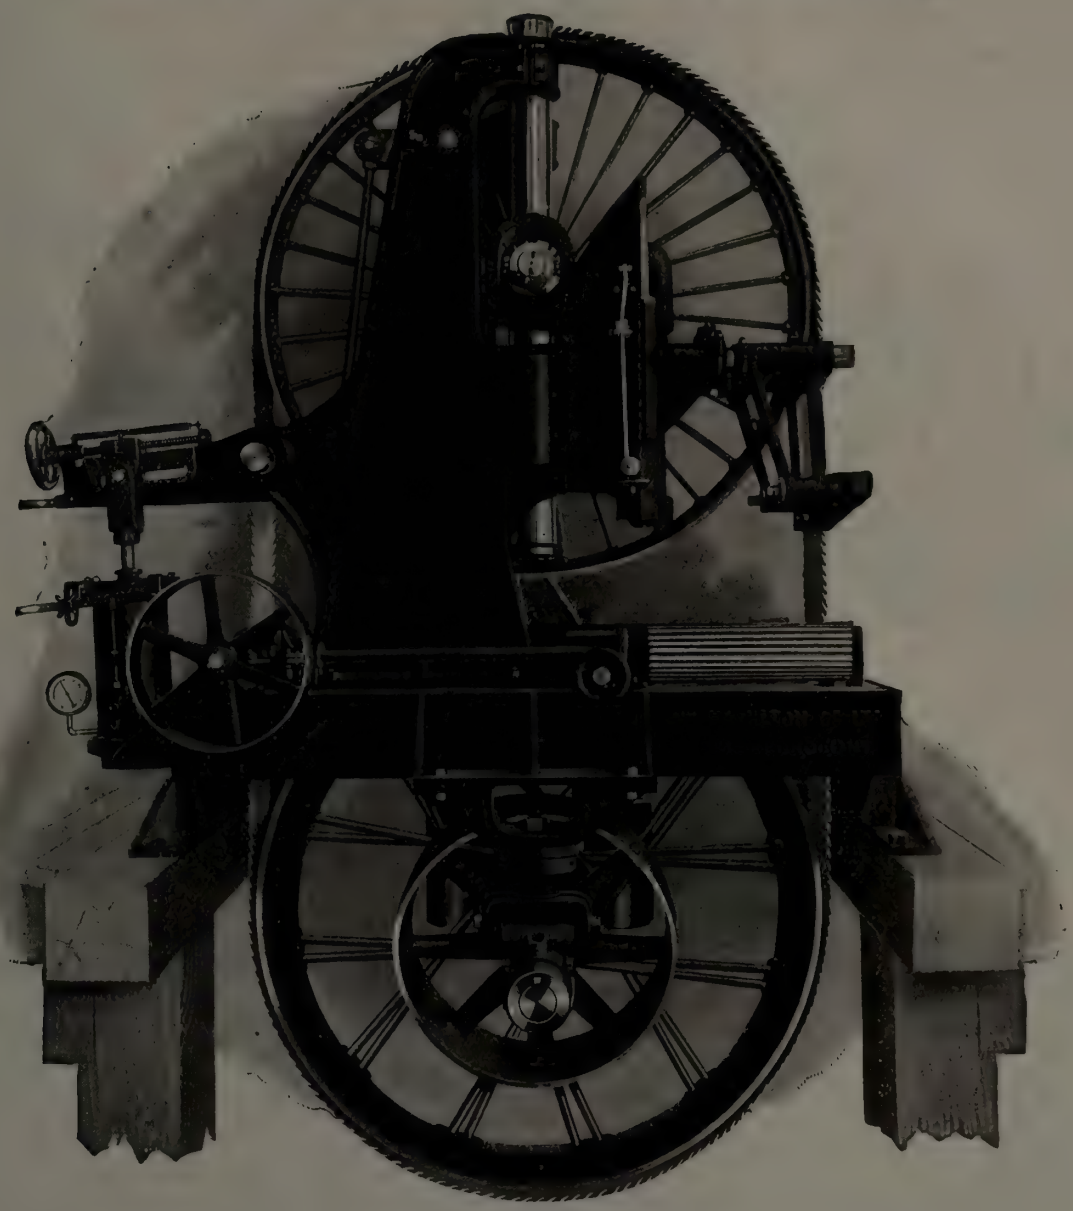
The Steam Tension Band Mill

Single and Double Cutting



Features which commend this Band Mill to favorable notice

(1) Tension on saws maintained by steam—quickest and most sensitive form of tensioning yet devised.
(2) Unbreakable saw guide raised and lowered by steam—**first used on our machine.**
(3) Great saving in saws—actual tests have proven saws have a longer life on this machine.
(4) Both top and bottom wheels instantly aligned by screw adjustment.
(5) Takes saws 12 in. to 14 in. wide.
(6) Heavy, rigid, strong and accurately built throughout.
(7) Built by expert workmen in a plant that has been manufacturing high grade sawmill machinery for sixty years.

May we send you a list of satisfied users?

"Wilson Bros." Flooring and Trim

"Wilson Bros." stamped on every piece of this flooring stands for Quality. Look for the name. Hardwood and Pine. **Interior Finish of All Kinds.** Also Hardwood Veneer Doors to detail. We are equipped to fill large or small orders on short notice. Write us for prices.

Wilson Bros., Limited - Collingwood, Ont.

A Good Belt Saves Money

THE money wasted in keeping a stretching belt taut amounts to a surprising figure. If you use "Goodhue Belts" in your mill or factory you can save most of this money because "Goodhue Belts" stretch less by 15 to 25 per cent than any other belt. They are made from skillfully selected hides with the stretch taken out of each section before it is made up into the belt.

According to the conditions under which the belt is to run, we recommend "Extra," "Standard" or "Acme Waterproof" belts.

Send for further particulars and prices

GOODHUE BELTS

J.L. GOODHUE & CO. Limited.

DANVILLE — QUEBEC.

LEVIATHAN OR ANACONDA

LEVIATHAN and ANACONDA have been sold on a "make good" basis for over thirty years. If they hadn't made good we would have been out of business long ago. The fact that our business is progressing rapidly is ample proof of the merit of this belting.

With every belt we guarantee full value in service, dollar for dollar, horsepower for horsepower, and just as we have figured our tables of horsepower for the best results, just so in making the above statement, we not only expect to give equal service, but BETTER SERVICE, AND MORE ECONOMICALLY.

A Leviathan Main Drive in constant service for four years at the plant of the Riviere du Loup Pulp Co.—24 in x 6 ply. No cost of up-keep; the belt has never been touched since the day it was installed.

Why not give us a trial order and let LEVIATHAN or ANACONDA prove itself?

The Clark Horizontal Resaw

Made with tables 20 or 24 ft. long with quick, accurate set works for cutting any thickness of lumber from ½" to 4" by 1/32 nds.

Will saw slabs or half logs 18" thick 24' long at a feed of 200' per min. **AND MAKE GOOD LUMBER.**

The two standard sizes have wheels 66" and 84" dia. and are made with either single or double table.

Write us for complete descriptive Catalog.

CLARK BROS. CO. - Olean, N.Y.

Garlock Packings

Are made in over two hundred styles and combinations to meet every known requirement. We will assume entire responsibility in selecting the proper styles and combinations of our packings to work successfully and economically under any stated condition; and if goods are not wholly satisfactory to purchaser we will refund promptly the cost of same. A card will bring our new catalog which fully describes our various styles of packings.

Style No. 777

Style No. 150

The Garlock Packing Co.

Hamilton, Ontario

Branches: Calgary Montreal

Branches: Toronto Winnipeg

Not altogether what we say but what users say

"We have used the Alligator or Warping Tug manufactured by you for the last 7 or 8 years, and consider them indispensable to lumbermen on waters of French River or similar streams."

Will move a bag containing 60,000 logs, in calm weather, 30,000 in a head wind.

THE CANADA METAL COMPANY, Limited

Head Office and Factory TORONTO Fraser Avenue

Branch Factories :—HAMILTON, MONTREAL, WINNIPEG, VANCOUVER

Promote Friction at the Bench — — !

Not mental — physical friction. Do not ask a workman to turn out a good job with a poor file.

When a file reaches its "inefficient point," it reduces physical friction but creates mental friction.

A man working with a poor file knows that he is not doing his best, knows that he is taking twice, or three times, as long to do the job and will surely be irritated if he is called to account for the result.

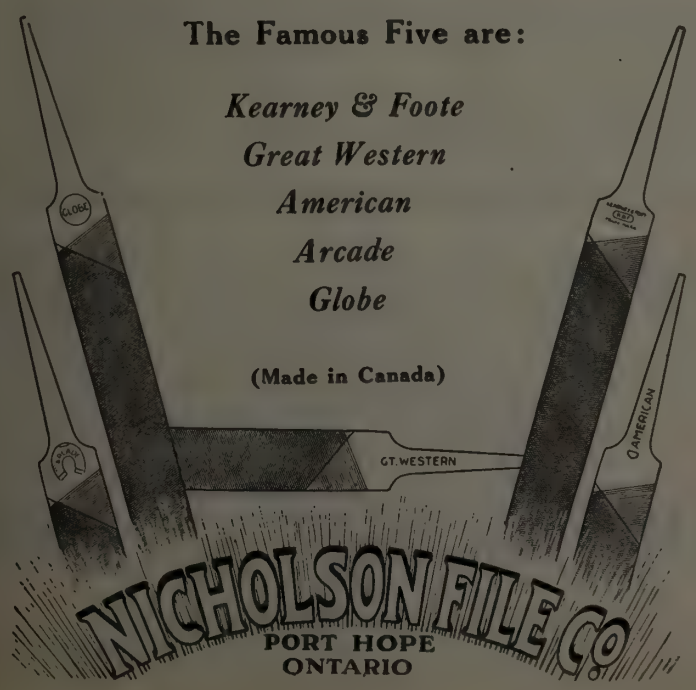
It is cheaper to supply a new file than it is to have a workman irritated for half an hour using an old one.

Have your factory superintendent and shop formen see that their men turn in their files for new ones, the moment they reach their "inefficient point."

The Famous Five are:

Kearney & Foote
Great Western
American
Arcade
Globe

(Made in Canada)



Plymouth Lathyarn

Gives maximum yardage, strength and durability.

Use it and save money.

PLYMOUTH CORDAGE COMPANY
NORTH PLYMOUTH, Mass. WELLAND, Ont.
INDEPENDENT CORDAGE CO , LTD.
TORONTO, ONT. — CANADIAN AGENTS

Makers also of Manila rope for every purpose.

Don't Blame the

FIRE BRICK

if it fails to give satisfaction. More likely than not you have been using the wrong kind for your particular purpose. A firebrick intended for use in a small hand-fired boiler may not give the same result if used under high pressure boiler with mechanical stoker.

So when sending us your enquiries be sure to specify for what purpose these brick are to be used.

You are sure then of a high quality brick, that is absolutely the best for your purpose.

We Manufacture the Following Well Known Brands

"Elkco," "Elk Steel," "St Marys," "Keystone" and "Rotex"

Catalogue is yours for the asking.

LOGGING LOCOMOTIVES

The designs of our Logging locomotives are the result of wide experience, extending over a period of 80 years.

The material used in their construction is thoroughly tested and is the best of its kind.

All details are accurately finished to standard gauges and are absolutely interchangeable on all locomotives of the same class and size.

This cuts out long delays at critical times of the work, as parts liable to wear can be kept on hand or shipped promptly from our works.

No. 3 Lath Machine

For the mill, whose requirements call for an enormous output, we recommend our No. 3 Lath Machine.

Designed primarily to work in conjunction with our No. 4 and No. 3 Bolters. The well known capacities of these Bolters, both in quantity and quality, will give you an idea of the product turned out by our No. 3 Lath Machine.

Covering a period of years, we have placed these Lath Machines in all parts of Canada.

The reputation they have established has led to repeat sales in the majority of cases where increased capacity was desired.

Simple in construction, strong in frame and bearings, with all parts easily accessible for adjustment, our No. 3 Lath Machine is without doubt the leader in this field.

Floor space, 4 feet x 4 feet 6 inches.

Weight, 1,600 pounds.

Maximum power required, 15 H. P.

"FROST KING" METAL

Our thirty-five years experience in metal mixing enables us to place on the market a babbitt that we believe to be absolutely perfect. For high speed machinery and engine work it is without an equal. It is specially designed for saw-mills, planing mills, threshing engines, traction engines, pumps, rolling mills, pulp machinery, and all classes of stationary engines. It is a high grade metal made of the very best selected stock, and carefully compounded.

If your dealer does not stock FROST KING send us a money order for your requirements. **Price 30c per lb.**, Fort William and East; West of Fort William **35c per lb.**, delivered nearest railway station; packed in 30 lb. and 60 lb. boxes.

For extra duty, such as over-hanging saws, our FAULTLESS BABBITT will stand where all other metals will fail. Price, Fort William and East, **40c per lb.**; West of Fort William, **45c**, delivered to your nearest railway station; packed in 30 lb. and 60 lb. boxes.

COSTS LESS PER DAY

AMPHIBIA BELTING

COSTS LESS PER DAY

Put Good Belting

on your

Good Machines

Your machines are expensive, and naturally you expect them to turn out the quality and quantity of work commensurate with their cost.

Then why harness them with belting which cannot begin to do them justice?

Use

"AMPHIBIA"

Planer Belting

and get the most work from your machines, in the quickest time, at the lowest cost per day of service.

Try a sample run of "AMPHIBIA" Planer and prove its merits.

HAMILTON, ONT.

FOR SALE: Machinery and Timber

The undersigned offer for sale, in large or small blocks all their remaining timber lands, mills and town property situated in the town of Parry Sound, Ont.

We have sold quite a number of timber parcels but still have some good bargains left in Townships of McDougall, Foley, McKellar, Monteith, Carling, Christie, Shawanaga, Burpee, McConkey, Mills, Allen, Secord, Falconbridge and Street.

Special bargains in the townships of Burpee, Falconbridge and Street for small mills.

We have the following Sawmill Machinery for sale:

1 8 ft. Double-cutting Telescope Band Mill, made by Waterous Engine Works.

1 3-block right hand steam feed carriage fitted with steam set works, made by Wm. Hamilton, Peterboro, with 10-in. steam feed cylinder.

1 Double cylinder steam nigger, right hand.

1 Log Loader for right hand mill.

1 8 ft. Double-cutting Telescope Band Mill, made by Waterous Engine Works.

1 10 in. Double-cylinder steam feed carriage, left hand, for cutting 24-ft. logs.

1 left-hand steam nigger.

1 Log-loader.

1 Endless chain jack ladder with two kickers complete for right and left hand mills.

1 Roger Gang Edgers for 8-in. cants and lumber.

1 Waterous double edger, 6 saws.

1 2-saw trimmers.

1 20-ft. Slash table.

1 16-ft. Revolving Slash Table.

1 Horizontal Slab Resaw with 5-ft. wheels, made by Diamond Iron Works.

1 70-ft. Transfer Chain for sorting lumber, with necessary levers, rolls and transfer chains to complete outfit.

1 Lath Mill with bolter.

2 Lath Trimming Saws.

FILING ROOM

1 Automatic Filing Machine for 12-in. D.C. band saws.

1 Automatic Grinding Machine for 8-in. S.C. band saws.

1 Hand Machine for cut-off saws.

1 Lap Grinder.

1 Set Band Saw Rollers and levelling blocks, with necessary swedges, a number of second-hand band, gang, edger and slash table saws.

POWER PLANT

2 Double Duplex, high pressure Water Pumps.

5 60-in. x 16-ft. Return Tubular Boilers, allowed 125 lbs. steam.

2 125 h.p. Water Wheels.

1 Upright Engine for sawdust conveyor.

1 10 h.p. Engine.

1 Mitts & Merrell Hog.

1 Wood Machine for 22-in. wood.

1 Edger for ripping dry lumber, installed.

1 Edger for ripping dry lumber, not installed.

1 30 h.p. Generator, 250 volt.

1 30 light arc generator.

There is also a large quantity of shafting, pulleys, hangers, belting, tram cars and turn-tables, particulars of which may be had on application.

All of the above open for inspection at Parry Sound.

The Parry Sound Lumber Co., Limited, 26 Ernest Ave. Toronto, Can.

LINE YARD HEAD

Instructs Eighteen Managers

TO ORDER

Arkansas Soft Pine

Action Denotes Grasp of Dealer Benefits Derived from Selling a Superior Product which is Nationally Advertised.

Circular Letter

———————, Iowa,
May 13, 1916.

TO YARD MANAGERS:

We are asking the Arkansas Soft Pine Bureau to send you a copy of their Home Builders' Book, together with a quantity of letter inserts to be used in connection with any communication that you have occasion to mail to your customers. While the plans shown in these books may or may not be such as will appeal to your customers, we are convinced that the use of Arkansas Soft Pine can be increased materially by our own efforts joined with those of the Arkansas Soft Pine Bureau, and that our customers will receive material that cannot fail to please them.

It has been our custom in the past to buy Short Leaf lumber for our inch stock, and in a large number of instances, we have bought the Arkansas Soft Pine. We are more than ever favorably impressed with the Yellow Pine manufactured by the mills in the Soft Pine district. Particularly is this wood fitted for interior trim, for ceiling and flooring. The Bureau will furnish you, if you desire, a set of framed panels showing the various kinds of finish that can be applied to Arkansas Soft Pine.

In speaking of this wood to your customers, we suggest that you do not use the words, "Yellow Pine," as applying to it, but term it "Arkansas Soft Pine," which more fully expresses the character of the wood, as it is free from pitch, and in many instances, has an appearance similar to the Northern White Pine, which has always met with favor.

On your future orders for inch Southern Pine, particularly those containing finish, flooring, and ceiling, we suggest that you indicate on the requisitions that you prefer Arkansas Soft Pine. This will bring the matter to Mr. 's attention. If we are advocating the use of this wood, it will be necessary for us to have some of it in stock. You perhaps will understand that the wood referred to is a high type of Soft Yellow Pine. The term Arkansas Soft Pine is applied to distinguish it from the Yellow Pine, that is shipped from the other districts in the South. This particular Pine has some merits that the lumber from the other districts does not have.

Yours truly,

———————— Lumber Company,

By ————————
General Manager.

(The foregoing is a bona fide letter, written by one of Iowa's substantial retail lumber concerns.)

This service referred to is yours for the asking.

All stock bearing the Arkansas Soft Pine Trade Mark is manufactured and sold exclusively by the following companies:

Arkansas Lumber Company, Warren, Ark.

GENDRON
SHOE PACKS

THE P.T. GENDRON SHOE PACK CO. MIDLAND GENDRON MIDLAND ONT. CAN.

Made in Canada

Gendron Genuine Draw String Shoe Packs embody the latest and best ideas of manufacture. They wear, they keep the feet dry, they are comfortable under all conditions. These are the main points.

The price is reasonable. The value is away above the price. You will like these shoe packs if you try them. Hundreds of lumbermen facing the same conditions as you, are enthusiastic about them.

Our manufacturing process is thorough from start to finish. We are careful with every pair.

Send for our catalogue and prices.

P. T. Gendron
Shoe Pack Co.
Limited

MIDLAND, ONT.

Original "Dunbar" Machines

We are the original and the only makers of "Dunbar" Shingle Machines, Lath Machines, Clapboard Machines, Steam and Gasoline Logging Engines. Each is the best for its particular work. Are you using the best?

Lath Machine

From our many years of experience we evolved this "Dunbar" Original Lath Machine. Every improvement that could be suggested, every time-tested idea for the betterment of product and for greater speed, has been incorporated in this machine. We believe it has no equal, and there are a great number of mill men throughout Canada who share this belief with us. Carefully constructed of high grade materials and designed to work steadily under the hardest conditions.

Steam and Gasoline Logging Engines

Conditions in Canada necessitate an engine that will stand any amount of strain and hard work in the lumber industry. With this idea in mind we have brought out the "Dunbar" engines perhaps a little stronger than is really needed. They do their work easily and willingly, and stand a great amount of hard usage. Built entirely in Canada for the Canadian lumber trade.

Clapboard Machine

You will need no excuse for the quality of your product if you use the original "Dunbar" Clapboard Machine. Expert in every detail. This machine will give you the very best service under most trying conditions. It will turn out work without delays. It will need practically no repairs and will increase your output. We cannot recommend it too highly because it is giving this very service to lumbermen in all parts of this country.

Send for catalogues of any or all of these machines.

"The Canada Lumberman and Woodworker" is published in the interest of, and reaches regularly, persons engaged in the lumber, woodworking and allied industries in every part of Canada. It aims at giving full and timely information on all subjects touching these interests, and invites free discussion by its readers.

Advertisers will receive careful attention and liberal treatment. For manufacturing and supply firms wishing to bring their goods to the attention of owners and operators of saw and planing mills, woodworking factories, pulp mills, etc., "The Canada Lumberman and Woodworker" is undoubtedly the most direct and profitable advertising medium. Special attention is directed to the "Wanted" and "For Sale" advertisements.

Authorized by the Postmaster General for Canada, for transmission as second class matter.

Entered as second class matter July 18th, 1914, at the Postoffice at Buffalo, N. Y., under the Act of Congress of March 3, 1879.

Vol. 36 Toronto, June 15, 1916 No. 12

Overhead Expense—How Do You Figure It Out?

A few retail lumbermen were having a talk about business matters recently and came, before long, to a discussion of estimating overhead expenses. It was not many minutes before they realized that their ways of getting at this important matter varied greatly. They may have been able to reach fairly satisfactory estimates by their various methods, but the differences in their ways of doing it showed clearly the necessity for having the problem worked out in a co-operative way, so that it may be reduced to a fairly standard basis. If a standard of this nature can be introduced there is no question that the great majority of the retailers will jump at it and soon gain a far more practical conception of the important details of their business.

As things are at present, many a retailer gives little or no attention to the overhead cost, or even—in some cases—to many other important details of his accounting.

One of the men taking part in the above discussion told of a retailer who used to do business in the good old-fashioned way, involving the least possible amount of bookkeeping. When he wanted to know how he was getting along he looked up his balance at the bank. When he wanted some money, either for the business or for personal use he cashed a cheque. Somehow or other, there always seemed to be funds in the bank, and he did not see the necessity for keeping an intricate set of books. How many lumbermen would last out a whole year nowadays if they did things in this manner? Another retailer we heard of at the same time had quite a good memory and at the end of the day—after he had been home for his supper—he returned to the office and entered up the day's sales and receipts. He did not bother about them at the time of the transaction. A third party was reported who had never taken stock since the day he commenced business, some six years before; and so on. Many a case was related which showed how important it is under modern competitive methods to know accurately what it costs to do business, so that you may be able to charge a proper price for your goods and your service.

Once upon a time there was a certain dealer who was discussing trade conditions with a friend. "How are things going," the friend asked. "Fine," the dealer replied. "I have been striking some pretty hard competition, but I have no trouble in meeting it, as the other fellows have to buy land for their yards and I own my place." The friend rubbed his eyes and asked the value of the yard, from a real estate point of view. It was probably worth about $40,000, as it was located in an important part of the city. When the friend was leaving he made a remark which rather puzzled the dealer for a time, saying to him that he intended to take up some property in that neighborhood upon which he would probably come to the dealer for a mortgage. Of course, he would count upon getting the mortgage without paying any interest upon it, as he expected the dealer would do as well by him as he had done by himself. After the dealer had puzzled over this remark for a time, he rubbed his own eyes and changed his accounting system so that it includes an annual charge of $2,000 as interest upon his investment.

It is important that everyone engaged in the retail lumber business should figure out this overhead question fully until he is satisfied that he has included every item that should be included. Only in such a manner can one be sure that he is going ahead and making enough profit to continue in business. Failure to do this is the chief cause of price-cutting. It is safe to say that any man who intends to commence a price-cutting campaign will be cured of his folly if he devotes a few days to a study of his overhead expenses, before cutting his prices. Just so surely as he does not, so surely will all the items of overhead co-operate ruthlessly and continuously in favor of his competitor whom he is trying to force out of business, and finally involve him instead of his competitor in extensive loss or complete failure.

For these reasons we would like to see the problem of overhead expense accounting reduced to its simplest form, so that it may be, to a very great extent, standardized. This is a work which could be handled by a number of retailers getting together and submitting their own methods as a basis for study. It would not be long before a practical plan could be worked out which would be a great improvement upon most of the individual plans submitted, and would enable all retailers who wish to take advantage of it, not only to understand their own costs and selling prices better, but to know that the other fellow was basing his quotations upon similarly accurate information.

The Lumberman, the Architect and the Contractor

At a recent meeting of the Lumbermen's Section of the Toronto Board of Trade an address was delivered by one of the leading architects of Toronto, who discussed, among other things, a plan which he had in mind for enabling lumber dealers to be far more certain than they are at present of securing pay for the materials they deliver on a job. One could not help feeling, when listening to this address, that it might be made the beginning of a much closer approach between architects, contractors and lumber dealers than has existed in the past. It is a peculiar thing that the architect and the lumber dealer are, in the majority of cases, quite good friends, and that the lumber dealer and the contractor also are good friends, but that the architect and the contractor do not, in many cases, pull well together. There seems to be some antagonistic spirit at large between architects and contractors that often leads to trouble. We hear, many and many a time, in connection with a building that has been poorly constructed, that the trouble was the result of bickering between the architect and the contractor. We hear also that such and such an architect was not onto his job, did not watch the contractor close enough and that the latter "put it over him" in one way or another, so that the job suffered. Why is it that these two parties, whose harmonious relation has so much to do with the success of a job, are fre-

quently unable to get along amicably, while each of them is able to make good friends with the lumber dealer? The reason we bring this question up is that whenever the architect and the contractor do not get along well together the lumber dealer suffers along with the others, both because of the uncertainties connected with a job on which there is frequent trouble, and because of the danger that the job may be stopped.

It occurs to us, in this connection, that the lumber dealer may be able to act the part of the peacemaker. Frequently he does take this part in connection with a particular job. Possibly he could go further, that is to say, he and his fellow lumber dealers might do the same thing collectively. The lumber dealers in a large city, for instance, might get together in their association and discuss ways and means of bringing about better relations between the architects and contractors with whom they do business; that is to say, those responsible architects and contractors who show a desire to get along amicably together, but so frequently are not able to do so. How the thing can be brought about is not just an easy matter to figure out off hand, but we believe that, in the first place, a body of lumber dealers might invite representatives of the architects to discuss matters with them, and similarly have a conference with representatives of the contractors; then perhaps have joint meetings of all three bodies and discuss practical ways of reducing friction.

The architect and the contractor are very essential to the progress of any community. The architects' services are important and are not overpaid. The contractor is a man who does things. He naturally looks for practical and concrete results. The architect, to some extent, while imbued with a desire for practical results, is also a man of high ideals in regard to his work. It is in the clashing of these opposite elements of character that much of the trouble arises. The contractor will tell you that when the architect takes charge of a job its cost immediately advances. The architect, on the other hand, knows of many cases where only the careful supervision of an architect will prevent an unscrupulous contractor from putting up an inferior class of building as compared with the one required by specifications.

There are good and bad men in all classes and in all professions —except perhaps among retail lumbermen—and it should be possible to group together the good ones in an effort to weed out the difficulties that develop when the bad ones get together or clash with the good ones. That is just what we are trying to bring out. We would like to see the lumber dealers of such a centre as Toronto, for instance, make a dead set upon the architects and contractors so as to get them to work together as harmoniously as possible, and incidentally so as to have each of them use up as much lumber as they possibly can. We believe big results would be secured to all three classes and the poor lumber consumer or owner of a building under construction would get better service and better buildings than he ever got before.

Lumber Trade Needs More Knowledge About Lumber

We have had something to say in recent issues of the Canada Lumberman about the extent to which cement and other building materials have been replacing wood, and we have done what we could to place the matter before our readers forcibly enough to lead them to realize that, to quite a considerable extent, they may, by a united effort, reduce the loss to the lumber trade which results from this competition. There is no question that much of the old time trade of lumber has gone over to the substitute materials, never to return, but there is still plenty of room to do something to prevent the movement from going further and at the same time to educate lumbermen, architects, engineers and consumers generally to a better understanding of the uses of wood. It is not possible to improve the lumber trade by running down the use of steel and cement, but it is possible to teach engineers, architects, contractors and prospective home builders that they can make far greater use of wood than is usual and get splendid satisfaction by so doing.

While we have expert engineers all over the world working out problems in steel and concrete construction, where will you find anything that can be called a wood engineer? Architects are supposed to know all that is necessary regarding the qualities of wood for construction purposes, but how many of them really have any such knowledge? Probably about one in fifty. And who is to blame? Not the architect, surely, as he is not interested in the sale of lumber. He informs himself mostly about those materials for which he finds the greatest demand, and he finds that the ordinary layman's knowledge of lumber is almost sufficient for him in order to deal with such varieties and qualities of lumber as his work calls upon him to include in his buildings. The blame attaches definitely and solely to the men who are interested in the sale of lumber. They will talk to one another about the ignorance of architects, whereas they are the ones who are ignorant of the methods that should be followed in order to educate architects regarding wood.

Until quite recently very few lumbermen or lumber associations have done anything in the way of getting out useful or commercial information about what their wood products will do, where they should be used and how to avoid certain dangerous tendencies in certain grades and varieties. The aim of the manufacturer has been to move his stock and, if the wrong stock often found its way into a building, so much the better, as it afforded an opportunity for selling some more. Little wonder that steel and concrete, backed up by scientific engineering data and experience, found it a simple matter to take over much of the business that formerly went to wood.

Throughout the greater part of the past, everything has been haphazard in the lumber business, so far as educating the consumer or the architect was concerned. With the completion of the sale the producer has felt that his end of the business was over and that the next thing was to look for another customer. There has been far too little consideration of the interest of the man who pays for the lumber and uses it. And, seeing that this was the disposition of the lumbermen, who could expect the architects to take much more interest than the lumbermen themselves in the use of wood?

How many architects or lumbermen can tell the carrying capacity of a 10-inch floor constructed of 2 x 10 on edge for a mill constructed building? How many can tell whether 2 x 10 or 3 x 10 is better for such a purpose, and why? And so on through a hundred and one questions, the answer to which should be at the immediate disposal of everyone who is interested in the sale of lumber. These are practical questions, not matters of theory. They come up every day in construction work. Many first class architects and engineers know the answer, but the body of the trade and many of the architects do not Why should not all the information upon these points be accumulated so that any architect or builder will be able to get possession of it readily?

Take the matter of concrete construction itself. How many lumbermen have a definite idea of the extent to which lumber can be used in the erection of a concrete building and the best ways of using it? Don't they leave all such matters to the man who is interested in concrete, instead of studying them and seeing that lumber gets all that is coming to it, even in the erection of a concrete building? As sellers of wood, lumbermen should be able to say that such a size and such a grade are best suited to the needs of a certain class of concrete building work. They should be able to show the man who is putting up a concrete building how to make a saving in connection with such lumber as he has to use and thereby make sure that he gets good results when using lumber and becomes, to some extent, a friend of lumber.

The whole question gets down to the old one of grades. Grades worked out intelligently and understood by the trade will be the basis upon which to establish a greater volume of trade. Such grading rules as have already been put into effect have proven this conclusively, and as the grading rule movement grows, the markets will improve. When we have reached a fairly good understanding about grades we will be in a sound position for accumulating scientific data

upon which to base our efforts to give wood a sound position among architects and engineers, and it will be possible for us to exploit every possible market for lumber, instead of the comparatively few that are now exploited to anything like their full extent. We believe that the recently developed tendency to advertise lumber is clearly working along these lines. Lumber cannot be advertised successfully unless those who do the advertising know its uses intimately. The two movements go hand in hand, and if they are worked out logically and followed up relentlessly to their natural limits there is a great day ahead of the lumber trade.

Keeping in Touch with Prospective Customers

Keeping track of prospective business is a pretty important matter in connection with any branch of the lumber business. For the retailer it is perhaps of greater importance than for others, as the sources of his business vary so greatly from day to day, whereas in connection with the wholesaler and the manufacturer it is possible to carry, even in one's head, a large proportion of the important information regarding customers.

The retail lumber dealer must not only keep in close touch with the regular customers upon whom he can, to a certain extent, depend for an average amount of trade, year in and year out, but he must watch keenly for the transient customer, or for the man who is breaking into a new line of business involving the consumption of considerable stocks of lumber and who is likely to become an important consumer in the near future. Probably every retailer has his own special method of handling this part of his business. Some allow it to look after itself, and unquestionably lose a great deal of good business by so doing. In looking after itself, it will quickly learn to follow the line of least resistance, which, in all cases, leads directly towards the yard of the man who keeps closely in touch with prospects and tries to turn them into customers. Therefore, the argument is all in favor of a system which will simplify this work and put it upon a good result-giving basis.

According to the variety of business found in each locality, the best method of working out a system for keeping track of prospective business will vary, but the main points are common to all systems. They are all based upon eternal vigilance, coupled with a good system of tabulating and filing the information secured. The manager of any retail lumber yard should give much of his time to this work. If he is also the chief, or the only salesman, he should find that by reducing this work to a systematic basis, the yard's business will soon be increased to such an extent that other salesmen will be needed, and his own work can be given over more definitely to the management end.

We have no intention, at this time, of going into details regarding a system for conducting this work. Our idea is only to lay emphasis upon its importance and urge those who are inclined to neglect it, to change their ways. At the same time we may outline roughly the way in which the work is done in connection with many large and small yards. A good system of this sort depends upon two factors; first, the securing of information, and second, its being filed conveniently so that it can be made of use to good effect. Securing information about prospects depends upon keen work on the part of salesmen and managers, upon the service given to customers which induces them to come back and also to send in information when they know of other men who are likely to be in the market, and upon many little things in connection with the working of a business which show the public that your stocks are good and your service is complete.

Those who are engaged in selling, either for a single yard or for a number of related yards, should make an absolute rule of recording all information they receive about prospects and sending it to the manager to be placed upon file in a systematic manner. This information should all come before the manager regularly. All the information regarding a particular job, or a particular customer's probable and actual requirements, should be filed in correspondence folders and laid before the manager at such time as he requires it. In order to put this into effect, the usual method is to handle it in connection with a card index, using date ticklers in connection therewith. When the information has been considered and acted upon by the manager he instructs the stenographer at what date he wishes it to come before him again and a date tickler is attached to the card index accordingly. At the beginning of each day the stenographer lays before him all the correspondence and information regarding each prospect which is to be dealt with on that day. The files for the day are attended to and each is advanced to a later date, or otherwise disposed of according to its requirements. When a prospect has been converted into a customer, the correspondence or information in the file may be transferred to the files of the department which handles shipment or the production and shipment of the goods sold. If a job is lost, the file may be handled as seems best, either by being "killed," or by being filed in connection with an index card and tickler which will bring it up for consideration at a more distant date, when it is possible that the same party may again become a prospect.

A system based upon these ideas, worked out in detail to suit the different cases, will make all the difference between a progressive business and a dead one. It will, to a great extent, enable a firm to eliminate much of its circular letter work and confine itself to correspondence bearing upon actual prospects which are live at the time they are being dealt with. Information may be gathered a long time in advance and filed away with a confident assurance that when it is needed it will come up. There is no possibility of forgetting a prospect if this plan is followed. It may seem rather a cumbersome plan at first, but once it has been got into working shape, it will look after itself and will introduce into the whole routine of the office and yard an element of orderliness that will be one of its greatest assets. Moreover, in the course of a comparatively short time a system of this sort will enable a manager, by going through his files to obtain a practical idea of how much business he can count upon in the near future, as it is a fairly simple matter to figure out from past records the percentage of prospective business that materializes into orders.

Canada's exports of forest products for the month of April, 1916, were valued at $2,287,939. In April of the two preceding years the values were as follows:—1915, $1,929,440; 1914, $1,874,739. For the twelve months ending April the exports of forest products were valued as follows:—1916, $51,629,899; 1915, $42,705,384; 1914, $42,797,161.

Import of lumber into Barbados, B.W.I., was affected more than any other line during the early days of the war. There has been a recovery, however, and the imports of white pine and spruce from Canada have come up to the average, increasing from £21,228 to £32,832 last year. Less pitch pine was imported from the United States, and fewer staves and shooks, though since January 1, 1916, a large falling off has taken place in the value of imported shingles from Canada, amounting to nearly £10,000, which appears to be due partly to the fact that a large quantity was in stock in the island at the beginning of the year. Large quantities of pncheon staves are required in Barbados each year and also in the other West Indian islands, the annual value being about £100,000. A serious attempt is recommended by Canadian firms to produce a stave from some hardwood other than oak, or from Douglas fir, to meet this demand.

The recent reference in news dispatches to the idea of a department store in Portland, Ore., by which lumber is sold in the store, in "Short Lengths for Odd Jobs," has been followed by the establishment of similar departments in a dozen big American cities, where bits of board are sold for 2, 3 or 5 cents. The idea has spread so rapidly that a company has been formed at Portland under the name of the Miniature Lumber Company, to supply department stores with cabinets for display of such lumber.

Death of Flight Sub-Lieut. J. R. Chamberlin

The Late Flight Sub-Lieut. J. Russel Chamberlin
